* IBM offers, with machines, the font image for the IBM Defined Graphic Character Set of 7,190 characters. The user can order the font diskettes for the User Defined Graphic Character Set which included the new characters added by the user up to 4,370 characters. The user designs the font image of a new character added by the user, assigns its code within the code point range allocated by IBM for user's option set, and orders the Font Loading from IBM (NDD). Font storage Expansion feature on a 3274 mdl 52C is mandatory for Taiwan in order to display up to 11,560 Chinese Character.

Operator Factors: The 3278 mdl 52 has an anti-glare screen. Indicators are displayed in symbols on the bottom row of the screen, outside the data area, and provide useful operator information. Host display of data on the screen is accomplished without refresh interrupt (i.e., no blinking).

Kanji/Chinese keyboard allows an operator to depress data keys which are grouped into three regions defined by usage frequency of the characters on the Kanji/Chinese Keyboard. EBCDIC data entry is allowed using a typewriter-like Keyboard embedded in the Kanji/Chinese Keyboard.

The Japanese Katakana or English US keyboard which is low in profile, provides a palm rest area and has separators to help prevent accidental striking of control keys.

Editing Functions: Cursor move, tab, home key, back tab, insert, delete, extended erase (erase to end-of-field, erase all keyboard input data, and erase entire screen) and cursor select keys are all basic for displays equipped with a keyboard. All alphameric, special symbol, and cursor move keys on Japanese Katakana or English US keyboards have typamatic. Double speed cursor typamatic is attained with a simultaneous depressing of the ALT key and a horizontal cursor positioning key on Kanji/Chinese, Japanese Katakana and English US keyboards. The cursor select function provides an alternative to the Selector Light-Pen function. Fields of data may be selected by positioning the cursor and then using the cursor select key.

Input Flexibility: A choice of keyboards or the selector light-pen provides input flexibility --- see "Special Feature" below. Fields of data can be selected by positioning the cursor and operating the cursor select key, instead of using the selector light-pen. 12 Program Function (PF) keys for Japanese Katakana or English US typewriter keyboards and 24 PF keys for Kanji/Chinese keyboard are provided as basic.

Keyboards: Refer to "Type Catalog" for a picture of the keyboard layouts. Contact your country Special Product Marketing Representative for RPQ Keyboard descriptions. Limitations: Keyboards used on 3275/77 machines are not interchangeable with keyboards used on 3278 mdl 52. Keyboards #2715, #2716, and #2717 are supported only for Japan, and keyboards #4621, #4622, #4623, and #4627 are supported only for Taiwan and Hong Kong. Field Installation: Yes. The keyboard is set up by the customer. Specify: For keyboards, #2715, #2716, #2717, #4621, #4622, #4623 and #4627, if standard 0.9 meter (3 foot) keyboard cable is not desired, specify #9399 for 1.8m (6 ft) cable.

Security Functions: A special non-displayed input mode provides for fields of data to be program-defined so that they will accept data entered from the keyboard without displaying the data on the screen. A security keylock (optional) prevents modification or display of data in the display terminal unless the key is turned to the "on" position. These capabilities and the terminal's ability to identify itself to the host program allow customer-supplied security program routines to control access to data and audit of actions.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This increased availability has been achieved through the use of problem determination and recovery procedures that are easily understood and used by the operator. The procedures will be provided in the "IBM 3270 Kanji/Chinese Information Display System Operator's Guide N", GA18-2056 (for Japan) or T, GA18-2056 (for Taiwan and Hong Kong). Also, see "Customer Responsibilities".

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system and other vendor preparation.
2. Placement of the 3278 mdl 52.
3. Physical setup, connection of cables in customer access areas, switch settings and check out.
4. Contact Customer Engineering to make cable connections of IBM CSU units to non-CSU units where customer access areas are not provided.
5. Notify IBM of intent to relocate and follow IBM instructions for relocation.
6. Use and follow the problem determination procedures.
7. Disconnecting at the time of discontinuance. Appropriate instructions will be provided by IBM.

Publications: See specific system bibliography.

SPECIFY

- Power (AC, 1-phase): Specify #2998 and then select one of the following:

50 Hz	60 Hz
For Japan and Hong Kong:	
110V #2804	100V #2730
For Taiwan:	110V #2822

For Hong Kong, external voltage converter (100V 200V) is required.
- Plugs: For Japan, specify #9890 for locking plug or #9891 for nonlocking plug. For Taiwan and Hong Kong, specify #9891.

- Power Cord: If standard 2.8m (9 ft) power cable is not desired, specify: #9513 for 4.5m (15 ft) cable.
- Cables: See "Accessories" for cable ordering instructions. For cable specification, see An Introduction to the "IBM 3270 Kanji/Chinese Information Display System, N," GA18-2055 (for Japan) or T, GA18-2055 (for Taiwan and Hong Kong).
- Character Set Language:

#2782 for Chinese
#2783 for Japanese
- Keyboard Language: For Japan - Specify #2983 when ordering keyboard #2715, #2716, #2717, or #2723.

For Taiwan and Hong Kong - Specify #2982 when ordering keyboard #2723, #4621, #4622, #4623 or #4627.

Limitations: The Keyboard Language must conform to the character set language. For #2783, specify #2983 (Japan only); for #2782, specify #2982 (Taiwan only).

SPECIAL FEATURES

Audible Alarm (#1090): An alarm, sounded under program control, to alert the operator to a special condition. This alarm, during keyboard operation, is also sounded when a character is entered into the next-to-last position on the screen. The operator may adjust the volume of the tone. Maximum: One. Field Installation: Yes.

Switch Control Unit (#1720): This feature permits switching operational control of that display between two different 3274 mdl 52C. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

76-Key Japanese Katakana T/W KB (#2715): Typewriter-like layout, movable. 12 PF keys are available in the top row of data keys through use of an alternate shift key. This keyboard provides 49 data keys and 27 control keys. Prerequisites: #2983.

76-Key Japanese Katakana Data Entry KB (#2716): Movable, four-level shift providing 49 data keys, 10 PF keys and 27 control keys. Prerequisites: #2983.

254-Key Kanji/Chinese KB (#2723): Movable, with 216 data keys, 20 function keys, 12 shift keys, two mode keys, one reset key, one enter key, one alternate key and one space bar, for entering 2567 Kanji or 2592 Chinese on-board characters by 12 shift operation, and one blank by Space Bar and not-on-board characters by Gaiji Number and 128 EBCDIC Katakana characters for Japan or 95 EBCDIC English US characters for Taiwan by conventional typewriter like operation. 24 PF keys are provided. Prerequisites: #2983 or #2982.

For Hong Kong, RPQ ZC8810 must be ordered.

88-Key Japanese Katakana T/W KB (#2727): Typewriter-like layout, movable, with 49 data keys, 26 control keys and 12 PF keys (24 total PF keys). 12 of the PF keys are available in the top row of data keys and are available through the use of alternate shift key. This keyboard provides 4-level shift, 49 data keys and 27 control keys. Prerequisites: #2983.

75-Key Typewriter KB (#4621): Typewriter-like layout, movable, with 49 data keys and 26 control keys. 12 PF keys are included in the top row of the data keys through use of an alternate shift key. Prerequisites: #2982.

75-Key Data Entry KB (#4622): Movable, with 35 data keys, 10 PF keys and 30 control keys. Prerequisites: #2982.

75-Key Data Entry KB (#4623): Keypunch layout, movable, with 35 data keys, 10 PF keys and 30 control keys. This is the recommended keyboard for data entry. Prerequisites: #2982.

87-Key EBCDIC Typewriter KB (#4627): Typewriter-like layout, movable, with 49 alphanumeric data keys, 26 control keys and 12 PF (total 24 PF keys). 12 of the PF keys are included in the top row of

data keys through use of an alternate shift key. Prerequisites: #2982.

Keyboard Numeric Lock (#4690): Provides any keyboard (except Kanji/Chinese keyboard) with the ability to lock the keyboard, if a non-numeric key (other than 0-9, minus, decimal sign, or dup) is operated in a pre-defined numeric-only field. Maximum: One. Field Installation: Yes. Prerequisites: Keyboards, #2715, #2716, #2717, #4621, #4622, #4623 or #4627.

Security Keylock (#6341): A lock and key which prevents modification or display of protected data in the display terminal when in the "off" position. Maximum: One. Field Installation: Yes.

Selector Light-Pen (#6351): A hand-held, pen-like device which permits the operator to select fields of data from a display for input to the host system. The selector light-pen, while not being used, can be placed in a recess of the keyboard, which is provided for user's incidental items. Selector light-pen (and cursor selector) operations have been expanded to include a new designator character "&". When this designator is used the Read Modified operation returns both the addresses and the data of all modified fields on the screen. Five designator characters in Kanji/Chinese field (Null, Blank, Greater than sign, Question Mark and Ampersand) are coded in two bytes. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Cables: IBM shielded twisted pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted pair cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation with your country.

Coaxial cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787; "Coaxial Cable and Associated Manual," GA27-2805.

- ASSM 2577672 Cable Assembly In-Door
- BULK 0323921 Coax Wire (Note 2)
- P/N 1836418 Connector Kit (Note 2)
- ASSM 1833108 Cable Assembly Out-Door
- BULK 5252750 Coax Wire (Note 3)
- P/N 1836419 Connector Kit (Note 3)
- P/N 1833104 Station Protector Kit, Carbon (Note 5)
- P/N 2621414 Modification Kit (Note 6)
- P/N 1833106 Station Protector Attachment Kit (Note 6)
- P/N 1833104 Station Protector Kit, Carbon (Note 5)
- P/N 5252772 Station Protector Element Carbon (Note 7)
- P/N 5252643 Adapter (Note 8)
- P/N 1830818 Station Protection Kit, Gas (Note 5)
- P/N 5252699 Station Protector Element, Gas (Note 7)

Notes:

1. Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.
2. Coax wire and one connector kit (includes two connectors P/N #1836446) required for each indoor cable assembly.
3. Coax wire and one connector kit (includes two connectors P/N #1836447) required for each outdoor cable assembly.
4. Customers replacing 2260 display stations may utilize the existing installed cables by use of this modification kit. One kit required for each cable.
5. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.

6. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
7. Replacement station protector elements.
8. Use to join two P/N #2577672 or two P/N #1833108 cable assemblies together.

Keyboard Accessories: The following keyboard accessories allow the customer to define and change the messages on the keytops of the 3278 keyboards. These accessories affect keytops only and do not change any characters or functions of the display station. The accessories consist of legendable keytops, blank keytops for customer engraving and a keytop extractor. These accessories are ordered by P/N rather than by MES.

Legendable Keytop: The legendable keytop consists of two parts: a molded key base and a clear plastic cover. The user may define unique keytop messages by writing on a piece of paper, affixing the paper to the keytop base, and sliding on the clear plastic cover. The keytop is available in three colors and with top keyboard row contour only. (Example: Clear key.) Purchase only.

Legendable Keytops:	P/N
White	5188775
Charcoal Gray	8627192
Light Gray	8542831

Blank Keytop: The blank keytop is for use as an unlabeled keytop or for customer engraved nomenclature. The keytop comes in three colors and is available with top keyboard row contour only. (Example: Clear key.) Purchase only.

Blank Keytops:	P/N
White	1853775
Charcoal Gray	1853567
Light Gray	1853563

Keytop Extractor (P/N 9900373): The keytop extractor is a small small tweezer-like device which fits between keytops. With a firm squeezing grip on a keytop, it can be pulled off its stem. The customer should use the extractor whenever a keytop is to be removed from a keyboard. Purchase only.

Keyboard Overlay: A keyboard overlay is available on which customer-defined Programmed Symbols can be annotated. An annotated overlay can be placed over the narrow keytops of Overlay keyboards to associate specific keytops with specific symbols.

Keyboard Overlay	P/N 1742762
88-Keyboard Overlay	P/N 1742781

Keys (P/N 2577741): The 3278 with Security Keylock #6340 is shipped with two keys. Additional keys may be purchased only from IBM. Vendor will supply additional keys only to original purchaser. A letter of authorization, with key identification number (stamped on key) must accompany each order. Allow two to three weeks for delivery.

Magnetic Hand Scanner (P/N 4123495): The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations. The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: For delivery with machine, see "Machines" pages. When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There

is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking --- for 50 scanners, 2 spares --- for 100, 3 --- for 150, 4 --- for 200, 5.

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service for the Magnetic Scanners will be preformed by the CE. The customer can obtain post-warranty maintenance on a Time and Material basis from CE. The customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Magnetic Slot Reader (P/N 4123500, Feature #9441): The Magnetic Slot Reader (MSR) attaches by a 1.5 meter cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc. The MSR has three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. A magnetic reader attachment feature on the appropriate machine is required to use the MSR.

Ordering Instructions: For delivery with machine, see "Machines" pages. When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking --- for 50 readers, 2 spares --- for 100, 3 --- for 150, 4 --- for 200, 5.

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service for the Magnetic Scanners will be preformed by the CE. Optionally, the customer can obtain post-warranty maintenance on a Time and Material basis from C E. A Magnetic Reader attachment feature on the appropriate machine is required to use the Magnetic Slot Reader.

Magnetic Reader/Scanner Extension Cables: These cable assemblies can be used to extend the Magnetic Hand Scanner P/N 4123495 or Magnetic Slot Reader P/N 4123500 distances. Additional Extension Cable lengths other than those listed below are available. See RPQ Reference List. MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. Limitations: Extension cables cannot be plugged into other extension cables.

6m (20 ft), P/N 4832986
12m(40 ft), P/N 4832987

Magnetic Reader/Scanner Replacement Assemblies

Description	P/N
MHS Sensor Head Assembly	4832721
MHS Handle and Feedback Assembly	4832701
MHS Amplifier Card and Cable Assembly	4832727
MSR Arm and Sensor Head Assembly	4832963

MSR Base and Feedback Assembly	4832973
MSR Amplifier Card and Cable Assembly	4832962
MSR Cover	4832964

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking.

Magnetic Hand Scanner

Number of MHSs	Sensor Assemblies	Handle and Feedback Assembly	Amplifier Card and Cord Assembly
P/N	P/N	P/N	P/N
4123495	4832721	4832701	4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader

Number of MSRs	Arm and Sensor Head Assem	Base and Feedback Assem	Amplifier Card and Cord Assem	Cover
P/N	P/N	P/N	P/N	P/N
4123500	4832963	4832973	4832962	4832964
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

Switch Control Unit: Permits switching operational control of a 3278 between two different control units. Customer is responsible for Procurement and installation of this accessory, and also for the replacement of a defective unit.

Warranty: The Switch Control Unit is warranted free from defects in workmanship and materials for 90 days.

Maintenance: There is no regularly scheduled maintenance recommended by IBM, and IBM Maintenance Agreements are not available.

Ordering Instructions: This accessory is ordered by P/N via MES for field installation only. For shipment with machine, by Feature Code number (see M3278).

One of the following P/Ns should be ordered when ordering by MES for field installation.

3279 COLOR DISPLAY STATION MODELS 2A-3B

(NO LONGER AVAILABLE)

The 3279 models 2A, 2B, 3A and 3B are no longer available. MES orders for model changes, features, released RPQs, and accessories are not affected. No new RPQs will be accepted. See other M3279 model pages.

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

A high quality color cathode ray tube (CRT) display station used in clusters with the 3274, the 3276, or the 4331 Processor for displaying alphanumeric data, and for entering data into and receiving data from a S/360, S/370, 4300, 4700 Finance Communication System, or 8100 Information System. In base color mode on all models data fields may be displayed in a choice from four colors. A keyboard, selector light-pen, or both, permit an operator to display and manipulate data on the screen in a flexible and efficient manner.

On extended color models 2B and 3B of the 3279, attached to a 3274, data may be displayed at both character and field level in seven colors, with a choice of highlighting modes. APL/Text is provided. Customer specified symbols and shapes may be displayed in any character position using Programmed Symbols. With its set of basic and optional features the 3279 meets both general purpose and unique display requirements.

MODELS 2A, 3A, 2B, 3B

Base Color

Model 2A A02: Displays up to 1,920 characters in 24 lines of 80 characters each.

Model 3A A03: Displays up to 2,560 characters in 32 lines of 80 characters each.

Extended Color

Model 2B B02: Displays up to 1,920 characters in 24 lines of 80 characters each.

Model 3B B03: Displays up to 2,560 characters in 32 lines of 80 characters each.

For use with 8100 Information System, see the "8100 System Configurator", GA27-2876. For use with 4700 System, refer to M4701 pages.

Prerequisites: 3279 requires a keyboard and a 3274 or 3276 with appropriate features, or a 4331 - see M3274, 3276, or 4331 pages.

Note:

Customer Setup (CSU): The 3279 is designated Customer Setup thereby offering the customer early availability and relocation flexibility. For additional information on CSU, contact IBM.

HIGHLIGHTS

Characters are displayed within a 9x12 character matrix on all mdls. On all mdls the basic 26 character uppercase letters are presented in 7x9 character matrix. A 94-character set is displayed consisting of 26 uppercase alphabetic, 26 lowercase alphabetic, 10 numeric and 32 special characters. A monospace switch provides the capability of switching to uppercase alphanumeric mode. The 3279 uses 3270 field formatting capability that permits individual fields of data on the screen to be program defined with various attributes, such

as protected/unprotected, normal/intensified, displayable/non-displayable and selector light-pen detection allowed/disallowed. An audible alarm is provided.

All 3279 mdls use the 3270 formatting attributes of protect and intensify for the additional purpose of displaying individual fields in base colors according to the following table.

Protected and intensified -- White
 Unprotected and intensified -- Red
 Protected and normal intensity -- Blue
 Unprotected and normal intensity -- Green

Extensions to 3270 data stream supported by appropriate 3274 features and by 3279 mdls 2B and 3B and the optional Programmed Symbols (PS) features provide the following field and character attributes:

- Extended Color (red, blue, green, white, yellow, turquoise and pink)
- Extended Highlighting (reverse video, blink, underscore)
- Programmed Symbols (six sets with 190 loadable positions each)

Each attribute can be specified independently of any other. Special keyboards are provided to allow operator control of these attributes.

Programmed Symbols can use the whole character matrix for symbol definition.

In addition, three of the sets of Programmed Symbols allow symbols and shapes to be displayed using multiple colors within a single character location.

(Canada only) > 3270 Personal Computer Attachment enables the IBM Personal Computer, 5150, to be attached to the 3279 mdls 2A, 3A, 2B, 3B. The display station and associated keyboard become common to both the host processor and to the IBM Personal Computer, thus expanding the use of the display station and the applications available at the display station. <)

3279 mdls 2B and 3B provide Extended Color, Extended Highlighting and APL/Text. 3279 mdls 2B and 3B are supported on 3274 mdls 1A, 1C, 1D, 31A, 31C, 31D, 41A, 41C, 41D, 51C, or 61C, and on the 3276 for APL/Text operation.

APL/Text capability provides for display of a 222-character APL/Text character set including the 94/116/127 character EBCDIC set. An appropriate keyboard is available. APL/Text requires a 3274 mdl X1A, X1C, or X1D, customized to include the APL/Text control function, or a 3276 with APL/Text control feature and its prerequisite, Extended Function Base feature. APL/Text operates in EBCDIC mode only and is NOT compatible with ASCII.

For Extended Color and Extended Highlighting on the 3279 mdls 2B and 3B, the structured field and Attribute Processing option of Configuration Support C or D is required on the 3274. The 3279 PS features require the Programmed Symbols option of the 3274 Configuration Support C or D. Extended Color, Extended Highlighting and PS function operate in EBCDIC mode only and are not compatible with ASCII. The 3279 mdl 2A will attach to the Display/Printer Adapter of the 4331 Processor.

For base color mode of operation, all mdls of the 3279 will attach to all mdls of the 3274. Configuration support on the 3274 must be at the following level or higher:

Configuration A - Release 11.1
 Configuration B - Release 22.0
 Configuration C
 Configuration D
 Configuration T

On the 3276, for base color mode, 3279 mdls 2A and 2B will attach to all 3276 mdls except mdl 1 and 3279 mdls 3A and 3B will attach to all 3276 mdls except mdls 1 and 2.

The operator may initiate a local display-to-printer (monochrome or color 3287) copy function (i.e., without host intervention) from the keyboard of a 3279 (except for graphics use of PS). When the 3279 is attached to a 3274, the printer designation is controlled by operator use of the IDENT key and by:

1. A printer authorization matrix which is loaded into the 3274 through a user-written host application program, or
2. A customer-definable matrix loaded from the System Diskette at IML time. For further details, see the "IBM 3270 Information Display System Planning and Setup Guide", GA27-2827.

When the 3279 is attached to 3276, the printer designation is controlled by operator use of the IDENT key and by a configuration default matrix. This matrix is determined by the relative positions of devices attached to the 3276.

Operator Factors: The 3279 has an anti-glare screen to improve contrast and readability. Indicators are displayed in symbols on the bottom row of the screen, outside the data area and provide useful operator information. These symbols, except those indicating color attributes will appear in blue. Display of data on the screen is accomplished without refresh interrupt (except that transient patterns are displayed when data is being loaded to the Programmed Symbols buffers). The keyboard, which is low in profile, provides a palm rest area and has separators to help prevent accidental striking of control keys. The operator may select one of several cursor modes. The cursor is displayed in white on the 3279.

A base color switch allows the 3279 mdls 2A and 3A to run in 'monochrome mode' for 3278 compatibility. In this mode fields are displayed in green for normal intensity and in white for high intensity. The switch has the same function on the 3279 mdls 2B and 3B if no extended color attributes are specified in the data stream. When extended color attributes are specified, the switch setting is ignored. Extended color will be displayed for those fields and characters for which it is specified. Other fields and characters will be displayed in green with white for high intensity.

For comfortable viewing the CRT face is inclined and may be adjusted to 15 degrees, 17.5 degrees, or 20 degrees from the vertical.

The operator may adjust the color convergence quickly and easily using a simple keyboard procedure with a special screen test pattern.

Editing Functions: Cursor move, tab, home key, back tab, insert, delete, extended erase (erase to end-of-field, erase all keyboard input data, and erase entire screen) and cursor select keys are all basic for 3279 displays. All alphanumeric, special symbol, and cursor move keys have repeat action capability. Double-speed cursor repeat action is attained with simultaneous depressing of the ALT key and a horizontal cursor positioning key.

Input Flexibility: A choice of keyboards and/or the selector light-pen provide input flexibility. A Magnetic Slot Reader (optional) and for a 3279 attached to a 3274, a Magnetic Hand Scanner (optional) are available for the input of magnetically coded data -- see "Special Features" and "Accessories" below. Fields of data can be selected by positioning the cursor and operating the cursor select key, instead of using the selector light-pen. 12 Program Function (PF) keys are basic with all typewriter keyboards. When attached to a 3274 with Configuration Support C with Entry Assist RPQ or with Configuration Support D with Entry Assist and with a typewriter or APL keyboard, the display provides capabilities which facilitate operator entry and editing of text material. The capabilities include margins, tabbing, word wrap, improved cursor positioning, improved character/word delete, cursor position indicator and an audible end-of-line warning tone. Entry Assist is intended for use primarily with a specific set of host editor programs. See M3274 pages for languages supported. See "Accessories" for 3274 Entry Assist keytops kits.

Keyboards: Refer to Type Catalog for a picture of the keyboard layouts. Contact your country Special Product Marketing Representative for RPQ keyboard descriptions. Limitations: Each 3279 Color Display Station must be equipped with a keyboard. Keyboards used on 3275/3277 machines are not interchangeable with keyboards used on 3276/3278/3279 machines. Maximum: One.

Field Installation: Yes. The keyboard is set up by the customer. A 0.9m (3 ft) keyboard cable is provided as standard.

Overlay and Attribute Select Keyboards: These keyboards are equipped with highlight, PS and color select function keys (12 PF keys on right-hand side of the keyboard). They provide operator selection under program control, of highlight, PS and color attributes.

Except for the color marking and annotation on the 12 PF keys on the right-hand side of the keyboard, the Overlay and Attribute Select keyboards appear identical to the equivalent non-Overlay and non-Attribute Select keyboards. Use of keys to select a feature not on the display will cause an error indication in the operator guidance row on the display. The uppercase and alternate shift of these 12 PF keys are used for attribute selection and are, therefore, not available for normal program function use. Limitations: Attribute selection is NOT supported for keyboards on a 3279 mdl 2B or 3B attached to a 3276, OR for keyboards attached to a 3279 mdl 2A or 3A.

Security Functions: A special non-displayed input mode provides for fields of data to be program-defined so that they will accept data entered from the keyboard without displaying the data on the screen. A Security Keylock (optional) prevents modification or display of data in the display terminal unless the key is turned to the 'on' position. These capabilities and the terminal's ability to identify itself to the host program allow customer-supplied security program routines to help control access to data and aid audit of actions. A Magnetic Slot Reader (optional), and for 3279 attached to a 3274, a Magnetic Hand Scanner (optional) are available to enter system user identification.

When attached to a 4331 Processor via the Display/Printer Adapter, functional support varies from that of the 3279-2A attached to a 3274 or 3276. See M4331 Display/Printer Adapter feature description for details of support.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This increased availability has been achieved through the use of problem determination and recovery procedures that are easily understood and used by the operator. The procedures are provided by the "Problem Determination Guide" manual that can be stored under the keyboard palm rest. Also, see "Customer Responsibilities".

Display Exception Monitoring Facility (DEMF), a software tool for network problem determination/isolation enhances the availability and serviceability of the 3274 and the 3276 in BSC mode. See "DEMF" in the SCP section for OS/VS1 and OS/VS2 (MVS).

Customer Responsibilities:

1. Adequate site, system and other vendor preparation.
2. Receipt at the customer's receiving dock, unpacking and placement of the 3279.
3. Physical setup, connection of cables in customer access areas, switch setting and check out.
4. Contacting CE to make cable connections of IBM CSU units to non-CSU units where customer access areas are not provided.
5. Notifying IBM of intent to relocate and following IBM instructions for relocation.
6. Using and following the problem determination procedures and filling out trouble report prior to calling for IBM service.
7. Disconnection, packing and removal to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.

Note: 3279 attachment to 3274 may require increments of 3274 control storage. Refer to 3274 control storage requirement tables to ensure that adequate Extended Function Store is available if required.

Bibliography: See "KWIC Index", G320-1621, or specific system bibliography.

SPECIFY

Specify codes may not be necessary to order a 3279. If codes are not specified, the machine is shipped with the following specifications:

- Power Cable Length: 2.8m (9 ft)
- Power Cable: If standard 2.8m (9 ft) power cable is not desired, specify #9513 for 4.5m (15 ft).
- Keyboard Cable Length: 0.9m (3 ft).
- Cables - See "Accessories" for cable ordering instructions.
- Power (AC, 1-phase, 50/60 Hz): Specify #2998 and one of the following: #2804 for input voltages between 100V and 120V. If 127V is required, specify #2820. Specify #2806 for input voltages between 200V and 230V. If 240V is required, specify #2801.

For Canada only, specify #9890 for locking plug or #9891 for non-locking plug (both at 60Hz, 120V, 1-phase). Canada will use the same power cord and plugs as the US.

For Japan only, specify #9890 for locking plug or #9891 for non-locking plug for voltages under 200 volts.

Plugs: The 3-digit country code (except Canada and Japan) on the DPMO sheet will be used to select a power plug which matches the most commonly used power supply in each country. If an exception is required, a country RPQ may be initiated.

- Power Cable Plug: If the most commonly used power cable plug in the country is not desired, then a country RPQ may be initiated. For details concerning power plugs, refer to "IBM 3270 Information Display System Installation Manual - Physical Planning", GA27-2787.

Note: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.

- Machine Nomenclature. Specify as follows:

Brazilian #2938
 Canadian Bilingual #2935
 English US #2931
 Japanese #2930
 Spanish Speaking #2931

- Keyboard Language and Character Set. Specify as follows:

Brazilian #2975
 Canadian/French #2977
 EBCDIC #2951
 English UK #2958
 English US #2956
 International #2950
 Japanese English #2955 (1)
 Japanese Katakana #2973 (2)
 Spanish Speaking #2969

Note 1: Japanese English applies only to keyboards #4622, #4623, #2708, #2715, #2717, #2718, #2719, #2721.

Note 2: Japanese Katakana applies only to keyboards #2708, #2715, #2716, #2717, #2718, #2719, #2721.

Note: English US (#2956) must be specified when keyboard #4629 (87-key typewriter/text) is used.

- Katakana Support: 127 characters (plus space and null) support is an enhancement of previously announced 3270 Japanese Katakana. This enhancement may not be 3270

compatible for customers using the NL and EM codes. Customers who do not use these codes will be 3274 and 3276 compatible. For details, see appropriate SRLs.

- Keyboard Language: All 3279s in a 3274/3276 cluster must specify the same keyboard language as that used on the 3274/3276. The keyboard language for 3279s on a 4331 must correspond with one of the language options specified on the 4331.

SPECIAL FEATURES

Not all of the following special features are supported for 3279-2As attached to a 4331 processor via the Display/Printer Adapter. See M4331 Display/Printer Adapter feature description for details of support.

Switch Control Unit (#1720): This feature, when installed on a 3279, permits switching operational control of that display between two different control units. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

88-Key Attribute Sel. Jap. Eng./Jap. Kat. T/W KB (#2708): Typewriter layout, movable, similar to #2717. Attribute Select functions are shown on the 12 function keys at the right hand side of these keyboards. Prerequisites: 3279 mdl 2B or 3B and #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

76-Key Jap. Eng./Jap. Kat. T/W KB (#2715): Typewriter-like layout, movable. 12 PF keys are available in the top row of data keys through use of an alternate shift key. The 76-key Japanese English Typewriter Keyboard provides 49 data keys and 27 control keys. Prerequisites: #2955 or #2973.

76-Key Jap. Kat. Data Entry KB (#2716): Movable, 4-level shift providing 49 data keys, 10 PF keys and 27 control keys. Prerequisites: #2973.

88-Key Jap. Eng./Jap. Kat. T/W KB (#2717): Typewriter-like layout, movable, with 49 data keys, 26 control keys and 12 PF keys (24 total PF keys). 12 of the PF keys are available in the top row of data keys and are available through the use of the alternate shift key. The Japanese Katakana keyboard provides 4-level shift, 49 data keys and 27 control keys. Prerequisites: #2955 or #2973.

88-Key Jap. Eng./Jap. Kat. T/W/APL KB (#2718): An 88-key Japanese English/Japanese Katakana Typewriter Keyboard (see #2717) with modified keytops to allow entry of 81 APL-specific characters in addition to the basic character set Japanese English or Japanese Katakana. An APL On/Off key controls whether the keyboard is in APL or basic character set mode. In contrast to the 88-key Japanese English/Japanese Katakana Typewriter Keyboard without APL (see #2717), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard area. Prerequisites: 3279 mdl 2B or 3B and #2955 or #2973.

88-Key Jap. Eng./Jap. Kat. T/W Overlay KB (#2719): This keyboard, without overlay has the same layout and can be used in the same way as the 88-key Japanese English/Japanese Katakana Typewriter Keyboard (see #2717). This keyboard however has special narrow keytops to permit the use of customer-annotated overlays. Six overlays are supplied with each keyboard. Additional overlays can be obtained via MES. See "Accessories". These overlays are used to show the symbols associated with the keys when one of the sets of Programmed Symbols is selected. The desired PS can be selected by the operator through use of the appropriate PF keys in uppercase and alternate shift on this keyboard. Overlay keyboards are equipped with highlight, PS and color select function keys. (12 PF keys on the right-hand side of the keyboard.) Enhanced functions are NOT supported on 3279 mdls 2A and 3A. Prerequisites: #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

88-Key Attribute Sel. Jap. Eng./Jap. Kat. T/W/APL KB (#2721): Typewriter layout, movable, similar to the 88-key Japanese English and Japanese Katakana Typewriter/APL keyboard (#2718). Attri-

bute Select functions are shown on the 12 PF keys at the right hand side of these keyboards. Prerequisites: 3279 mdl 2B or 3B and #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

75-Key EBCDIC Typewriter KB (#4621): Typewriter-like layout, movable, with 49 data keys and 26 control keys. 12 PF keys are included in the top row of data keys through use of an alternate shift key. Specify: Language required.

75-Key EBCDIC Data Entry KB (#4622): Movable, with 35 data keys, 10 PF keys and 30 control keys. Specify: Language required.

75-Key EBCDIC Data Entry KB (#4623): Keypunch layout, movable, with 35 data keys, 10 PF keys and 30 control keys. This is the recommended keyboard for data entry. Specify: Language required.

87-Key EBCDIC Typewriter/APL KB (#4626): An 87-key EBCDIC Typewriter Keyboard (#4627) with modified keytops to allow entry of 81 APL-specific characters in addition to the 94-character EBCDIC set. An APL On/Off key controls whether the keyboard is in EBCDIC typewriter or APL mode. In contrast to the 87-key EBCDIC Typewriter Keyboard without APL (see #4627), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard area. Prerequisites: 3279 mdl 2B or 3B. Specify: Language required.

87-Key EBCDIC Typewriter KB (#4627): Typewriter-like layout, movable, with 49 alphameric data keys, 26 control keys, and 12 PF keys (24 total PF keys). 12 of the PF keys are included in the top row of data keys through the use of the alternate shift key. Specify: Language required.

87-Key EBCDIC Typewriter/Text KB (#4629): An 87-key EBCDIC Typewriter Keyboard (see #4627) with modified keytops to allow entry of 65 Text-specific characters in addition to the 94-character EBCDIC set. A Text On/Off key controls whether the keyboard is in EBCDIC typewriter or Text mode. In contrast to an 87-key EBCDIC Typewriter Keyboard without Text (see #4627), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard area. Prerequisites: 3279 mdl 2B or 3B. #2956 only.

87-Key EBCDIC Typewriter Overlay KB (#4640): This keyboard, without overlay, has the same layout and can be used in the same way as the 87-key EBCDIC Typewriter Keyboard (see #4627) with the 94-character EBCDIC set. This keyboard however, has special narrow keytops that permit the use of customer-annotated overlays. Six overlays are supplied with each keyboard. Additional overlays can be obtained via MES. See "Accessories". These overlays are used to show the symbols associated with the keys when one of the Programmed Symbols is selected. The desired PS can be selected by the operator through use of the appropriate PF keys (12 PF keys on the right hand side of the keyboard) in uppercase and alternate shift of this keyboard. Enhanced functions are NOT supported on 3279 mdls 2A and 3A. Specify: Language required. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

87-Key EBCDIC Attribute Select Typewriter KB (#4651): A typewriter layout, movable, similar to the 87-key EBCDIC Typewriter Keyboard #4627. Attribute select functions are shown on the 12 PF keys at the right-hand side of the keyboard. Prerequisite: 3279 mdl 2B or 3B. Limitations: Cannot be installed on a 3279 attached to a 3276. Specify: Language required.

87-Key EBCDIC Attribute Select Typewriter/APL KB (#4652): A typewriter layout, movable keyboard, similar to the 87-key EBCDIC Typewriter Keyboard #4626. Attribute select functions are shown on the 12 PF keys at the right hand side of the keyboard. Prerequisite: 3279 mdl 2B or 3B. Limitation: Cannot be installed on a 3279 attached to a 3276. Specify: Language required.

Keyboard Numeric Lock (#4690): Provides keyboards #2715, #2716, #2717, #2718, #4621, #4622, #4623, #4626, #4627, #4629, with the ability to lock the keyboard, if a non-numeric key (other than 0-9, minus, decimal sign, or dup) is operated in a pre-defined numeric-only field. Maximum: One. Field Installation: Yes. Con-

tact local CE Branch Office for installation. MES No. 999999 is to be used for Incident Report (IR) completion data.

Note: The Numeric Lock Function is enabled on Keyboards #2719, #2708, #2721, #4640, #4651, #4652 as an option of 3274 customization in which case these keyboards will either all have, or all not have, the numeric lock function.

Magnetic Reader Control (#4999): Provides the capability of attaching a Magnetic Slot Reader or a Magnetic Hand Scanner which read encoded information from a magnetic stripe. The MSR can be used when the 3279 is connected to either a 3274 or 3276, but the MHS can only be used when the 3279 is connected to a 3274. Maximum: One. Field Installation: Yes.

(Canada only> IBM Personal Computer Adapter (#5322, #5325, #5327): This entry is for information purposes only - see Product Announcement Letter <) (Canada only> for ordering instructions and prices. Provides the capability of attaching an IBM Personal Computer, 5150, System Unit to the 3279. If only the IBM Personal Computer 5150 portion is required, order #5322. If only the 3279 portion is required, order #5327. The interconnection cables and user's guide with the Programming Diskette are included with the Personal Computer option #5322. A user's guide without the Programming Diskette may be ordered from Mechanicsburg, PA, using Form Number SA23-0169. Maximum: One. Prerequisites: (1) 3279 mdls 2A or 3A or 2B or 3B. (2a) IBM Personal Computer, 5150, mdl X14, X64, or X74 with Color/Graphics Monitor Adapter, or (2b) IBM Personal Computer System Unit with Color/Graphics Monitor Adapter, 5-1/4 inch Diskette Drive Adapter and one 5-1/4 inch Diskette Drive, and at least 64KB total user memory. (3) IBM Personal Computer DOS 1.1 or DOS 2.0. (4) a 3274 or 3276 control unit. Limitations: Cannot be installed with #4999, #6350 or #6351. Field Installation: Yes. Contact <) (Canada only> CE <) (Canada only> Branch Office for installation. <)

Programmed Symbols (PS) (#5781 and #5782): These features provide storage and accessing for up to six 190-symbol sets whose shapes and codes are customer-definable. Symbol sets are loaded under program control and accessed for display through programming or by an operator from the display keyboard.

The number of symbols in any one set that can accessed from the display keyboard is 94 or 116 for Canadian French or 127 for Japanese Katakana plus space.

PS-2, (#5781) Provides PS control and storage for two 190-symbol sets. Prerequisites: 3279 mdl 3B.

PS-4, (#5782) Provides control and storage for four additional 190-symbol sets. Three of these symbol sets can be displayed using multiple colors within a character block. Prerequisites: #5781. Limitations: Can be used only with a 3274 having the PS Control and Structured Field and Attribute Processing options of Configuration Support C or D. Maximum: One of each. Field Installation: Yes. Corequisites: If display operator access to PS is required, #2708, #2719, #2721 #4640, #4651 or #4652 must be ordered.

Note: If the 3279 is to be used with the Presentation Graphics Feature (PGF) of the Graphical Data Display Manager (GDDM) Program Product 5748-XXH, then both #5781 and #5782 must be installed.

Security Key Lock (#6340): A lock and key which prevents modification or display of data in the display terminal when in the 'off' position. Maximum: One. Field Installation: Not recommended.

Selector Light-Pen (#6350, #6351): (#6350 mdls 3A, 3B, #6351 mdls 2A, 2B) Hand-held, pen-like device which permits the operator to select fields of data from a display for input to the host system. The selector light-pen will detect on any color. The selector light-pen, while not being used, can be placed in a recess of the keyboard, which is provided for user's incidental items. Selector light-pen (and cursor select) operations have been expanded to include a designator character "&". When this designator is used, the Read Modified operation returns both the addresses and the data of all modified fields on the screen. The selector light-pen (#6351) has a slightly wider field of view to facilitate operator use. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

Model changes from 2A to 2B and 3A to 3B are field installable. Model changes from 2A to 3A or 3B or from 2B to 3A or 3B are not recommended for field installation.

ACCESSORIES

For shipment with machine, order the feature number as shown below. See detailed descriptions below for additional information and for ordering by MES for field installation.

Item	Feature Number	P/N	Max Qty
Magnetic Hand Scanner	#9440	4123495	*
Magnetic Slot Reader	#9441	4123500	*

* A maximum of one magnetic reader or scanner may be ordered.

Magnetic Reader Extension Cable for use with Magnetic Hand Scanner or Magnetic Slot Reader:

Item	Feature Number	P/N	Max Qty
6 meter (20 feet)	#9106	4832986	**
12 meter (40 feet)	#9107	4832987	**

** A maximum of one extension cable may be ordered.

Item	Feature Number	P/N
Tilt/rotate accessory	N/A	4422265
Control Unit Switch	MES only	
Battery	N/A	

The following cable assemblies can be used to extend the Magnetic Hand Scanner and Magnetic Slot Reader distances. Limitations: Extension cables cannot be plugged into other extension cables. Prerequisites: #4999.

Item	Feature Number	P/N
6 meter (20 feet)	#9106	4832986
12 meter (40 feet)	#9107	4832987

If ordering by MES for field installation, one of the following manuals should be ordered. English manual is always supplied. The MSR/MHS customer service manuals, and their form numbers, are:

French GA11-0007
Spanish GA10-8101
Japanese NGA24-3663

Both the MHS and the MSR read magnetically encoded information from an alphanumeric character set. The MSR also reads the same 10-character numeric only set as the 3277 Operator Identification Card Reader (#4600) which is not a subset of the alphanumeric character set. For a further description of both character sets, see "IBM 3270 Information Display System Character Set Reference", GA27-2837. Either (not both) the alphanumeric or the 10 numeric only 3277-like character set may be selected for the 3274 at customization time for attached 3278s and 3279s. The 3276 Control Unit Display Station and attached 3278s and 3279s support only the MSR and the 10-character numeric only set as used by the 3277.

Numeric and alphameric character capabilities are as follows:

	Minimum number of Hex Codes	Maximum number of characters	Density Bits
MSR/			

MHS	between start and end sentinel chars	per inch	per mm
3277-Like			
10-num char set*	7	37	75
	7	118	127
Alpha-meric char set*	7	37 num	75
	7	18 non-num	75
	7	118 num	127
	7	59 non-num	127
	7	37 num	210**

* 1 Hex code = 1 numeric character
2 Hex codes = 1 non-numeric character
** MSR only

Note: Full width encoding is recommended for the MSR and is required for the MHS.

Maximums shown are ALL numeric or ALL non-numeric characters. If a combination of numeric and non-numeric characters is recorded, the total number of hex CODES must not exceed the numeric character maximum. For example, at 127 bpi, a combination of 60 numeric and 20 non-numeric character is permissible.

Limitations: 3277-like 10 character set numerics only magnetic cards coded with Alternate End or Message character (hexadecimal 'C'), cannot be read by the MSR or MHS. The alphanumeric character set and the MHS are only supported on 3278s and 3279s which are attached to 3274s. IBM Host Programming Support is provided for alphameric character set non-protected, display data entry. Protected, non-display data entry is supported by IMS and TSO. With this protected, non-display data entry support, all cards and documents which can be read by the 3630 Plant Data Communication System, up to 118 data characters, can be read by the 3270 System.

A variety of magnetic documents, tags and labels which the MSR and MHS can read, may be obtained from IBM, some of which, depending on length, can be encoded by devices such as the 3642 Encoder Printer.

Switch Control Unit: Permits switching operational control of a 3279 between two different control units. Customer is responsible for Procurement and installation of this accessory, and also for the replacement of a defective unit.

Warranty: The Switch Control Unit is warranted free from defects in workmanship and materials for 90 days.

Maintenance: There is no regularly scheduled maintenance recommended by IBM, and IBM Maintenance Agreements are not available.

Ordering Instructions: This accessory is ordered by P/N via MES for field installation only.

One of the following P/Ns should be ordered when ordering by MES for field installation.

English 4419338
Canadian French 4419343
Japanese 4419346
Brazilian/Portuguese 4419348
Spanish 4419349

Lithium Battery (P/N 6042018): This supply item is a 3.0 Volt non-rechargeable lithium battery which provides power to sustain the convergence parameters in the 3279 when normal power is not present. Field Installation: Yes, by customer. Note: Discharged batteries should be returned to IBM for disposal, return information is printed on the label. Ordering Information: Order by DP Supply Order from Mechanicsburg.

Keyboard Overlay (P/N 1742762): A keyboard overlay is available on which customer-defined Programmed Symbols can be annotated. An annotated overlay can be placed over the narrow keytops of Overlay keyboards to associate specific keytops with specific symbols.

88-Keyboard Overlay P/N 1742781

Keys (P/N 4420756): The 3279 with Security Keylock #6340 is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys only to original purchaser). A letter of authorization, with key identification (on customer metal tag), must accompany each order. Allow two to three weeks for delivery.

Magnetic Hand Scanner (#9440, P/N 4123495): The Magnetic Hand Scanner (MHS) attaches by a 1.5m (5 ft) coiled cable to a 3279 that has an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. It can read a stripe in either direction. Field Installation: Yes. Prerequisites: #4999. See Note 1.

Ordering Instructions: For delivery with machine, see "Machines" pages. When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking: For 50 scanners, 2 spares; for 100, 3; for 150, 4; for 200, 5.

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a Time-and-Material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time-and-materials basis at the Repair Center. Authorization Form #2110 applies.

Magnetic Slot Reader (#9441, P/N 4123500): The Magnetic Slot Reader (MSR) attaches by a 1.5m (5 ft) cable to a 3279 that has an appropriate magnetic adapter feature. The slot reader accommodates a wide range (height and length) of magnetic striped card stock and plastic badges including job tickets, magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc. The MSR has three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. Field Installation: Yes. Prerequisites: #4999. See Note 1.

Ordering Instructions: For delivery with machine, see above. When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases,

more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking: For 50 readers, 2 spares; for 100, 3; for 150, 4; for 200, 5.

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a time-and-material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time and materials basis at the Repair Center. Authorization Form #2110 applies. A Magnetic Reader attachment feature on the appropriate machine is required to use the Magnetic Slot Reader.

Magnetic Reader/Scanner Extension Cables: These cable assemblies can be used to extend the Magnetic Hand Scanner P/N 4123495 or Magnetic Slot Reader P/N 4123500 distances. Additional Extension Cable lengths other than those listed below are available.

MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days.

Limitations: Extension cables cannot be plugged into other extension cables.

6m (20 ft) P/N 4832986
12m (40 ft) P/N 4832987

Magnetic Reader/Scanner Replacement Assemblies:

MHS Sensor Head Assembly 4832721
MHS Handle and Feedback Assembly 4832701
MHS Amplifier Card and Cable Assembly 4832727
MSR Arm and Sensor Head Assembly 4832963
MSR Base and Feedback Assembly 4832973
MSR Amplifier Card and Cable Assembly 4832962
MSR Cover 4832964

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking:

Magnetic Hand Scanner Replacement Assembly Stocking:

No. of MHSs P/N	Sensor Head Assy P/N	Handle & Feedback Assy P/N	Amplifier Card and Cord Assy P/N
4123495	4832721	4832701	4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader Replacement Assembly Stocking:

Number of MSRs P/N	Arm & Sensor Head Assembly P/N	Base and Feedback Assembly P/N
4123500	4832963	4832973

50	2	1
100	3	1
150	4	1
200	5	2
Number of MSRs	Amplifier Card and Cord Assy	Cover P/N
P/N 4123500	P/N 4832962	4832964
50	2	1
100	3	1
150	4	1
200	5	1

Ordering Instructions: Order from CE Stockrooms. See Instruction Letter ZM77-0038, DPCE letter #27 dated October 19, 1977.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

Display Station Keyboard Accessories: The following keyboard accessories allow customers to define and change the messages on single position keytops of the 3279 keyboards. These accessories supply keytops only and do not change any characters or functions of the display station. The accessories consist of legendable keytops, blank keytops for customer engraving, a keytop extractor, and an Entry Assist Keytop Kit.

These accessories may be ordered by P/N via a DP Supply Order from the Raleigh plant.

(Canada only) These accessories should be bulk ordered by P/N on a P&SR from the plant of manufacture. Individual customer requirements should be satisfied from local country stock. <)

Legendable Keytop: The legendable keytop consists of two parts: A molded key base and a clear plastic cover. The user may define unique keytop messages by writing on a piece of paper, affixing the paper to the keytop base and sliding on the clear plastic cover. The keytop is available in three colors and with top keyboard row contour only. (Example: Clear Key.)

White 5188775
Charcoal Gray 8627192
Light Gray 8542831

Blank Keytop: The blank keytop is for a customer to engrave with desired nomenclature. The keytop comes in three colors and is available with top keyboard row contour only. (Example: Clear Key.)

White 1853775
Charcoal Gray 1853567
Light Gray 1853563

Keytop Extractor (P/N 9900373): The keytop extractor is a small tweezer-like device which fits between the keytops. With a firm squeezing grip on a keytop, the keytop can be pulled off its stem. The customers should use the extractor whenever a keytop is to be removed from a keyboard.

Entry Assist Keytop Kit: (Non-overlay keyboards only) This kit provides eight sets of five keytops appropriately labelled for use with the Entry Assist capability together with a keytop extractor and keytop replacement instruction. Not for use on 3178 keyboards or overlay keyboards. The Keyboard Languages and P/Ns are:

Brazil 4942307
Canadian Bilingual 4942308
International, EBCDIC/WT 4942311
Japanese English 4942315
Spanish Speaking 4942318
English UK 4942312
English US 1742774

Display Station Tilt/Rotate Accessory (P/N 4422265): An accessory which fits under the display station and provides a ball and socket type movement to allow the angle of the screen face to be adjusted for comfort of viewing position. The screen angle is normally 20 degrees from the vertical but with this device it can be adjusted between 25 degrees to the vertical and the vertical position. A locking device is provided to maintain the selected position. This accessory also allows the display station to be rotated plus or minus 90 degrees from the central position and this movement is independent of the tilt movement.

For the countries in which it is released, the Tilt Rotate Accessory is an NDD Product.

Warranty: The Tilt Rotate accessory is warranted free from defects in workmanship and materials for 90 days.

Maintenance: There is no regularly scheduled preventive maintenance recommended by IBM, and IBM Maintenance Agreements are not available.

Customer Responsibility: The customer is responsible for mounting the Display Station on this accessory.

Cables: IBM shielded twisted pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted pair cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation with your country.

Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787, and "Coaxial Cable and Associated Manual", GA27-2805.

- Assm 2577672 Cable Assembly In-Door
- Bulk 0323921 Coax Wire (Note 1)
- P/N 1836418 Connector Kit (Note 1)
- Assm 1833108 Cable Assembly Out-Door
- Bulk 5252750 Coax Wire (Note 2)
- P/N 1836419 Connector Kit (Note 2)
- P/N 1833104 Station Protector Kit, Carbon (Note 4)
- P/N 2621414 Modification Kit (Note 3)
- P/N 1833106 Station Protector Attachment Kit (Note 5)
- P/N 5252772 Station Protector Element Carbon (Note 6)
- P/N 5252643 Adapter (Note 7)
- P/N 1830818 Station Protection Kit, Gas (Note 4)
- P/N 5252899 Station Protector Element, Gas (Note 6)

Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.

Notes

1. Coax wire and one connector kit (includes two connectors P/N 1836446) required for each indoor cable assembly.
2. Coax wire and one connector kit (includes two connectors P/N 1836447) required for each outdoor cable assembly.
3. Customers replacing 2260 display stations may utilize the existing installed cables by use of this modification kit. One kit required for each cable.
4. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
5. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
6. Replacement station protector elements.
7. Use to join two P/N 2577672 or two P/N 1833108 cable assemblies together.

SUPPLIES (NONE)

3279 COLOR DISPLAY CONSOLE MODEL 2C**PURPOSE**

A cathode-ray tube (CRT) Color Display Console which attaches to the 4331/4341/4361/4381 Processors and provides for operator interaction for both normal operations and maintenance. An Operator Console Keyboard with an operator control panel is available with the primary Display Console and is the means to Power On (4341 -- see "Special Features") Power Off, Initial Microcode Load (IML), and Start or Stop processor operations.

MODEL 2C**Model 2C C02**

Prerequisites: An available console position on any 4331/4341 Mdl Group 1 or 4331/4341 Mdl Group 2 See 4331/4341/4361/4381.

The 3279-2Cs require an Operator Console Keyboard. The 3279-2C that is used as the primary console on a 4331/4341 Mdl Group 1/4341 Mdl Group 2 must have an Operator Console Keyboard with an operator control panel.

HIGHLIGHTS

Displays characters in a 9x12 character matrix (uppercase alphabet is displayed in a 7x9 matrix), arranged in 24 rows of 80 characters each. Rows 1 through 20 are usable by the operator, rows 21 through 24 are used for system status information. A 96-character set is used, which consists of 26 uppercase alphabetic, 26 lowercase alphabetic, 10 numeric and 32 special characters, plus space and null.

Console messages are displayed in four colors (white, red, blue, or green) according to the status of the protected and intensified attributes. This gives the operator better perception of the system status.

When the 4300 is under control of VM/SP, the screen input area is green and the output area is blue. Input data that is re-displayed in the output area may be made white with the CP TERMINAL HIGHLIGHT ON command. In addition, messages from other users are displayed white.

In addition to Power On/Off, IML and Start/Stop, the console allows the operator to manually control such functions as storage display and operation, address comparing, and normal versus instruction step processing. The console indicates to the operator both proper operations and malfunctions, should they occur.

For maintenance and service support the console can display the status of the Processor complex and other valuable servicing information. It also provides a means for using diagnostic tools.

The 3279 mdl 2C that is used as the primary console is normally installed concurrent with the installation of the 4331/4341/4361/4381 Processors.

Operator Factors: The 3279 has an anti-glare screen to improve contrast and readability. Indicators are displayed in symbols and/or words on the bottom row of the screen. These symbols, except those indicating color attributes, will appear in blue. The keyboard, which is low in profile, provides a palm rest area and has separators to help prevent accidental striking of control keys. The cursor is displayed in white on the 3279. A base color switch allows the 3279 mdl 2C to run in monochrome mode for 3278 compatibility. In this mode fields are displayed in green for normal intensity and in white for high intensity. For comfortable viewing the CRT face is inclined and may be adjusted to 15 degrees, 17.5 degrees or 20 degrees from the vertical. The operator may adjust the color convergence quickly and easily using a simple keyboard procedure with a special screen test pattern.

Editing: Cursor move, tab, home, back tab, insert, delete, erase to end-of-field and erase all input keys are basic to the console keyboard. Alphanumeric, special symbol and cursor move keys have typamatic capability. 12 Program Function (PF) keys are basic.

Audible Alarm: An alarm sounded under program control to alert the operator to a special condition. This alarm, during keyboard operation, is also sounded when a character is entered into the next-to-last position on the screen. The operator may adjust the volume of the tone.

Security Function: The Security Keylock prevents modification or display of data in the display terminal unless the key is turned to the "on" position.

Problem Determination Procedures: Significant function has been designed into this unit to provide high availability to the customer. This high availability has been achieved through the use of problem determination and recovery procedures that are easily understood and used by the operator. The procedures are provided by the "User Reference Summary".

Base Color Supported:

Protected and intensified -- White
Unprotected and intensified -- Red
Protected and normal intensity -- Blue
Unprotected and normal intensity -- Green

Keyboards: Refer to Type Catalog for a picture of the Keyboard layouts. Limitations: Keyboards used on 3279-2C are not interchangeable with keyboards used on 3279 mdls 2A, 2B, 3A and 3B. Maximum: One of the below. Field Installation: No.

Contact your country Special Product Marketing Representative for RPQ Keyboard descriptions.

SPECIFY

Basic Configuration: The 3279 mdl 2C will be shipped with these specifications unless alternative codes are specified:

Cabling: Fixed-length 7.6m (25 ft) cables from the Display Console to the Processor for Keyboards #4631, #4632 and #4634 will be furnished by IBM and shipped with the processor. For Keyboard #4633, up to 30.5m (100 ft) of signal cable is provided by IBM and ordered via normal procedures. Additional cable for this feature up to a maximum total cable length of 1,500m (4,925 ft) must be provided by the customer as outlined in the 3279-2C specifications page in "IBM Input/Output Equipment Installation Manual - Physical Planning: System/360, System/370, 4300 Processors", GC22-7064 and "Installation and Assembly of Coaxial Cable and Accessories for Attachment to IBM Products", GA27-2805.

- Power Cable Length:
- Power (AC, 1-phase, 50/60 Hz): Specify #2998 and one of the following: #2804 for input voltages between 100V and 120V. If 127V is required, specify #2820 (not Japan). Specify #2806 for input voltages between 200V and 230V. If 240V is required, specify #2801 (not Brazil or Japan).

Note: Canada must specify #2804.

For Canada only, specify #9890 for locking plug (60 Hz, 120V, 1-phase). Canada will use the same line cord and plugs as the US.

For Japan only, all mdls will be supplied with locking plug for voltages under 200V. Specify #9891 for non-locking plug.

Plugs: The 3-digit country code (except Canada and Japan) on the DPMO sheet will be used to select a power plug which matches the most commonly used power supply in each

MACHINES

country. If an exception is required, a country RPQ may be initiated.

- **Power Cable:** If the standard 2.8 meter (9 foot) power cable is not desired, specify: #9513 for 4.5m (15 ft).
- **Power Cable Plug:** If the most commonly used plug in that country is not desired, then a country RPQ may be initiated. For details concerning power plugs, refer to "IBM 3270 Information Display System Installation Manual - Physical Planning", GA27-2787.

Note: If a power supply, not the most common, is specified and it is incompatible with the power plug commonly supported, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.

- The machine nomenclature, character set and Keyboard language defaults for the following countries are Spanish Speaking unless otherwise noted.

Argentina	Honduras
Bolivia	Mexico
Chile	Nicaragua
Colombia	Panama
Costa Rica	Paraguay
Dominican Republic	Peru
El Salvador	Uruguay
Ecuador	Venezuela
Guatemala	

Country	Nomenclature	Character Set & Keyboard Language
Brazil	Brazilian	Brazilian
Japan	Japanese	Specify Device Code
Canada	Canadian Bilingual	English US
Others	English	English US

For all countries, if another language is required, specify as follows:

Brazilian #2975
Canadian/French #2977
EBCDIC #2951
English UK #2958
English US #2956
International #2950
Japanese English #2955 (1)
Japanese Katakana #2973 (2)
Spanish Speaking #2969

Note 1: Japanese English applies to Keyboards #2720, #2727, #2728, and #2729.

Note 2: Japanese Katakana applies to Keyboards #2720 only.

Note: Character Set Language, and Operator Control Panel and System Function Keys Nomenclature are automatically generated by the Keyboard Language Specify.

SPECIAL FEATURES

76-Key Jap. Op. Con. KB, W/O Chan.-to-Chan. or Power On (#2720): (4331 only) Same as #2727 but the operator control panel does not have the Channel-to-Channel control key, the Channel-to-Channel Disabled Indicator, or the Power On key. Prerequisites: #2955 or #2973.

76-Key Jap. Eng. Op. Con. KB, with Chan.-to-Chan. (#2727): (4341 and 4381 only) Typewriter-like layout, movable, with 12 PF keys available on the top row through use of the Alternate Shift key. Provides 50 data keys and 26 control keys, and contains an operator control panel with 4 control keys (Power Off, Lamp Test, Power

On/IML, Channel-to-Channel) and 6 LED indicators (Basic Check, System, Wait, Power in Process, Power Complete, Channel-to-Channel Disabled). Channel-to-Channel is required for systems having a channel-to-channel adapter feature. Prerequisites: #2955.

76-Key Jap. Eng. Op. Con. KB, W/O Chan.-to-Chan. (#2728): (4341 and 4381 only) Same as the #2727 but the operator control panel does not have the Channel-to-Channel control key or the Channel-to-Channel Disabled indicator. Prerequisites: #2955.

76-Key Jap. Eng. Op. Con. KB (#2729): (4341 and 4381 only) Same as #2727 but without an operator control panel. Prerequisites: #2955.

75-Key Op. Con. KB with Chan.-to-Chan. (#4631): (4341 and 4381 only) Typewriter-like layout, movable, with 12 PF keys available on the top row through use of the Alternate Shift key. Provides 49 data keys and 26 control keys, and contains an operator control panel with 4 control keys (Power Off, Lamp Test, Power On/IML, Channel-to-Channel) and 6 LED indicators (Basic Check, System, Wait, Power in Process, Power Complete, Channel-to-Channel Disabled). Channel-to-Channel is required for systems having a channel-to-channel adapter feature. Specify: Optional Language if required.

75-Key Op. Con. KB, W/O Chan.-to-Chan. (#4632): (4341 and 4381 only) Same as #4631 but the operator control panel does not have the Channel-to-Channel control key or the Channel-to-Channel Disabled Indicator. Specify: Optional Language if required.

75-Key Op. Con. KB (#4633): (4341 and 4381 only) Same as #4631 but without an operator control panel. Specify: Optional Language if required.

75-Key Op. Con. KB, W/O Chan.-to-Chan. or Power On (#4634): (4331 or 4381 only) Same as #4631 but the operator control panel does not have the Channel-to-Channel control key, or the Channel-to-Channel Disabled Indicator or the Power On key. Prerequisites: Keyboard Language "Specify".

Cabling: Cables will be furnished by IBM for Features #2727, #2728, #2729, #4631, #4632 and #4634. For Features #2729 and #4633 the cables must be supplied by the customer as outlined for the 3279 mdl 2C in the "IBM 3270 Information Display System Installation Manual Physical Planning", GA27-2787.

(Canada only) > Waterproof Power Connector (#8802): Provides a waterproof connector on the power cable to satisfy local ordinances requiring this type of termination in specific locations. Limitations: Available only for power cord lengths of 1.8m (6 ft) #9511, or 4.5m (15 ft) #9513. Maximum: One. Field Installation: No.<)

MODEL CONVERSIONS

Not recommended for field installation.

ACCESSORIES

Refer to M4300 pages for information pertaining to the 4300 Processors Console Table.

Battery, Lithium P/N (6042018): This supply item is a 3.0 volt non-rechargeable lithium battery which provides power to sustain the convergence parameters in a 3279 when normal power is not present. Field Installation: Yes, by customer. Note: Discharged batteries should be returned to IBM for disposal. The return information is printed on the label. Ordering Information: Contact IBM.

Keyboard Overlay (P/N 1742762): A keyboard overlay is available on which customer-defined Programmed Symbols can be annotated. An annotated overlay can be placed over the narrow keytops of Overlay keyboards to associate specific keytops with specific symbols.

MACHINES

88-Keyboard Overlay P/N 1742781

Keys (P/N 2577741): The 3279, with Security Keylock, is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys only to original purchaser). A letter of authorization, with key identification, must accompany each order. Allow two to three weeks for delivery.

3279 Display Station Tilt/Rotate Accessory (P/N 4422265): An accessory which fits under the display station and provides a ball and socket type movement to allow the angle of the screen face to be adjusted for comfort of viewing position. The screen angle is normally 20 degrees from the vertical but with this device it can be adjusted between 25 degrees to the vertical and the vertical position. A locking device is provided to maintain the selected position.

This accessory also allows the display station to be rotated plus or minus 90 degrees from the central position and this movement is independent of the tilt movement. For the countries in which it is released, the Tilt Rotate Accessory is an NDD Product. **Warranty:** The Tilt Rotate accessory is warranted free from defects in workmanship and materials for 90 days. **Maintenance:** There is no regularly scheduled preventive maintenance recommended by IBM, and IBM Maintenance Agreements are not available. **Customer Responsibility:** The customer is responsible for mounting the Display Station on this accessory.

SUPPLIES (NONE)

3279 COLOR DISPLAY STATION MODEL S2A

PURPOSE

A high quality color cathode ray tube (CRT) display station used in clusters with the 3274, the 3276, or the 4331 Processor for displaying alphanumeric data and presentation graphics data, and for entering data into and receiving data from a S/3, S/360, S/370, 30XX, 4300 or 8100 Information System, or 4700 Finance Communication System. In base color mode on all models, data fields can be displayed in four colors. A keyboard, selector light-pen, or both, permit an operator to display and manipulate data on the screen in a flexible and efficient manner.

On extended color models S2B, S3G, 02X or 03X with Extended Function feature, attached to a 3274, data may be displayed at both character and field level in seven colors with a choice of highlighting modes. APL/Text is provided. On extended color model S3G, or 03X with the requisite optional features, customer specified symbols and shapes may be displayed in any character position using Programmed Symbols. With its set of basic and extended models, the 3279 meets both general purpose and unique display requirements.

MODELS S2A, S2B, S3G, 02X, 03X

(Canada only> **Model S2A:** Base Color -- Displays up to 1,920 characters in 24 lines of 80 characters each.

Model S2B: Extended Color -- Displays up to 1,920 characters in 24 lines of 80 characters each. Seven colors, extended highlighting and APL.

Model S3G: Extended Color Programmed Symbols -- Displays up to 2,560 characters in 32 lines of 80 characters each. Seven colors, extended highlighting and APL, and programmed symbols.<)

Model 02X: Custom Model -- Displays up to 1,920 characters in 24 lines of 80 characters each.

Model 03X: Custom Model -- Displays up to 2,560 characters in 32 lines of 80 characters each.

For use with 8100 Information System, see the "8100 System Configurator", GA27-2876. For use with 4700 System, refer to M4701 pages. Note: Mdls S2B, S3G, and 03X are not supported by System/3.

Prerequisites: 3279 requires a keyboard and a 3274, 3276, 4321 or 4331 -- see M3274, 3276, or 4331 pages.

Customer Setup (CSU): The 3279 is designated Customer Setup, thereby offering the customer early availability and relocation flexibility. For additional information on CSU, contact IBM.

HIGHLIGHTS

- Characters are displayed within a 9x12 character matrix on all mdls. On all mdls the basic 26-character uppercase letters are presented in 7x9 character matrix. A 94-character set is displayed, consisting of 26 uppercase alphabetic, 26 lowercase alphabetic, 10 numeric and 32 special characters. A monospace switch provides the capability of switching to uppercase alphanumeric mode. The 3279 uses 3270 field formatting capability that permits individual fields of data on the screen to be program defined with various attributes, such as protected/ unprotected, normal/intensified, displayable/non-displayable, and selector light-pen detection allowed/disallowed. An audible alarm is provided.
- All 3279 mdls use the 3270 field attributes of protect and intensity for the additional purpose of displaying individual fields in base colors according to the following table:

Protected and intensified -- White
 Unprotected and intensified -- Red
 Protected and normal intensity -- Blue
 Unprotected and normal intensity -- Green

- Extensions to 3270 datastream supported by appropriate 3274 features and by 3279 mdls S2B, S3G, 02X and 03X provide the following field and character attributes:
 - Extended Color (red, blue, green, white, yellow, turquoise and pink).
 - Extended Highlighting (reverse video, blink, underscore).
 - Programmed Symbols (six sets with 190 loadable positions each). (Mdl S3G or 03X with extended function feature #3850.)
 - Each attribute can be specified independently of any other. Special keyboards are provided to allow operator control of these attributes.
 - Programmed Symbols can use the whole character matrix for symbol definition. In addition, three of the sets of Programmed Symbols allow symbols and shapes to be displayed using multiple colors within a single character location.
 - (Canada only> 3270 Personal Computer Attachment enables the IBM Personal Computer, 5150, to be attached to the 3279 mdls S2A, S2B, S3G, 02X, 03X. The 3279 and associated keyboard become common to both the host processor and to the IBM Personal Computer, thus expanding the use of the display station and the applications available at the display station - see "Special Features"<)
 - 3279 mdls(Canada only> S2B, S3G, or mdls<) 02X or 03X with optional feature, provide Extended Color, Extended Highlighting and APL/Text. 3279 mdls(Canada only> S2B, S3G,<) 02X and 03X are supported on 3274 mdls 1A, 1C, 1D, 31A, 31C, 31D, 41A, 41C, 41D, 51C, or 61C and on the 3276 for APL/Text operation.
 - APL/Text capability provides for display of a 222-character APL/Text character set including the 94/116/127 character EBCDIC set. An appropriate keyboard is available.
 - APL/Text requires a 3274 mdl X1A, X1C, or X1D customized to include the APL/Text control function, or a 3276 with APL/Text control feature and its prerequisite, Extended Function Base feature. APL/Text operates in EBCDIC mode only and is NOT compatible with ASCII.
 - For Extended Color and Extended Highlighting on the 3279 mdls S2B, S3G, 02X and 03X, the Structured Field and Attribute Processing option of Configuration Support C or D is required on the 3274. The 3279 PS feature requires, in addition, the Programmed Symbols option of 3274 Configuration Support C or D. Extended Color, Extended Highlighting and PS function operate in EBCDIC mode only and are not compatible with ASCII. The 3279 mdl S2A, or mdl 02X without special features, will attach to the Display/Printer Adapter of the 4331 Processor.
 - For base color mode of operation, all mdls of the 3279 will attach to all models of the 3274. Configuration Support on the 3274 must be at the following level or higher:
 - Configuration Support A - Release 11.0
 - Configuration Support C
 - Configuration Support D
 - Configuration Support T
- (Canada only> Configuration Support C must be at Release 46.0 or higher to support 3279 models S2B and 02X shipped from June 1983 and 3279 models S3G or 03X shipped from January 1984. These machines are identified by a "-1" after the model number (e.g. S3G-1).<)

- On the 3276 for base color mode, 3279 mdls S2A, S2B, 02X will attach to all 3276 mdls except mdl 1, and 3279 mdls S3G or 03X will attach to all 3276 mdls except mdls 1 and 2.
- The operator may initiate a local display-to-printer (monochrome or color 3287) copy function (i.e., without host intervention) from the keyboard of a 3279 (except for graphics use of PS). When the 3279 is attached to a 3274, the printer designation is controlled by operator use of the IDENT key and by:
 1. A printer authorization matrix which is loaded into the 3274 through a user-written host application program, or
 2. A customer-definable matrix loaded from the System Diskette at IML time. For further details, see the "IBM 3270 Information Display System Planning and Setup Guide", GA27-2827.
 3. When the 3279 is attached to a 3276, the printer designation is controlled by operator use of the IDENT key and by a configuration default matrix. This matrix is determined by the relative positions of devices attached to the 3276.

Operator Factors: The 3279 has an anti-glare screen to improve contrast and readability. Indicators are displayed in symbols on the bottom row of the screen outside the data area, and provide useful operator information. These symbols, except those indicating color attributes, will appear in blue. Display of data on the screen is accomplished without refresh interrupt (except that transient patterns are displayed when data is being loaded to the Programmed Symbols buffers). The keyboard, provides a palm rest area and has separators to help prevent accidental striking of control keys. The operator may select one of several cursor modes. The cursor is displayed in white on the 3279.

A base color switch allows the 3279 to run in "monochrome mode". In this mode, fields are displayed in green for normal intensity and white for high intensity. When extended color attributes are specified, the switch setting is ignored. Extended color will be displayed for those fields and characters for which it is specified. Other fields and characters will be displayed in green with white for high intensity.

For comfortable viewing, the CRT face is inclined and may be adjusted to 15 degrees, 17.5 degrees or 20 degrees from the vertical. A tilt/rotate accessory (P/N 4422265) increases this range of adjustment.

The operator may adjust the color convergence quickly and easily using a simple keyboard procedure with a special screen test pattern. (Canada only) > This convergence procedure is not available on machines which have model numbers ending in -1 (e.g., S2A-1). These machines have their convergence set in the factory and no further adjustment by the operator will be required. <

Editing Functions: Cursor move, tab, home key, back tab, insert, delete, extended erase (erase to end-of-field, erase all keyboard input data, and erase entire screen) and cursor select keys are all basic for 3279 displays. All alphameric, special symbol and cursor move keys have repeat action capability. Double speed cursor repeat action is attained with simultaneous depressing of the ALT key and a horizontal cursor positioning key.

Input Flexibility: A choice of keyboards on all mdls, and/or the selector light-pen on the mdls 02X and 03X provide input flexibility - see "Special Features" and "Accessories" below. Fields of data can be selected by positioning the cursor and operating the cursor select key, instead of using the selector light-pen. 12 Program Function (PF) keys are provided with all typewriter keyboards. When attached to a 3274 with Configuration Support C with Entry Assist RPQ or with Configuration Support D with Entry Assist and with a Typewriter or APL keyboard, the display provides capabilities which facilitate operator entry and editing of text material. The capabilities include margins, tabbing, word-wrap, improved cursor positioning, improved character/word delete, cursor position indicator and an audible end-of-line warning tone. Entry Assist is intended

for use primarily with a specific set of host editor programs. See M3274 pages for languages supported. See "Accessories" for 3274 Entry Assist Keypoint kits.

Keyboards #2715, #2716, #2717, #2718, #4621, #4622, #4623, #4626, #4627, #4629 are supplied with Keyboard Numeric Lock function which provides the ability to lock the keyboard if a non-numeric key (other than 0-9, minus, decimal sign or dup) is operated in a pre-defined numeric-only field. Numeric lock function is enabled on keyboards #2708, #2719, #2721, #4640, #4651, #4652 as an option of 3274 customization, in which case these keyboards will either all have, or all not have, the numeric lock function. Limitations: Each 3279 must be equipped with a keyboard. Keyboards used on 3275/3277 machines are not interchangeable with keyboards used on 3276/3278/3279 machines. Field Installation: Yes. The keyboard is set up by the customer. Some keyboards may require pre-requisites which are not customer-installable. A 0.9m (3 ft) cable is provided as standard.

Overlay and Attribute Select Keyboards: These keyboards are equipped with highlight, PS and color select function keys (12 PF keys on right-hand side of keyboard). They provide operator selection under program control of highlight, PS and color attributes. Except for the color marking and annotation on the 12 PF keys on the right-hand side of the keyboard, the Overlay and Attribute Select keyboards appear identical to the equivalent non-Overlay and non-Attribute Select keyboards. Use of keys to select a feature not on the display will cause an error indication in the operator guidance row on the display. The uppercase and alternative shift of these 12 PF keys are used for attribute selection and are, therefore, not available for normal program function use. Limitations: Attribute Selection is not supported for keyboards on a 3279 attached to a 3276.

Security Functions: A special non-displayed input mode provides for fields of data to be program-defined so that they will accept data entered from the keyboard without displaying the data on the screen. A Security Keylock prevents modification or display of data in the display terminal unless the key is turned to the ON position. These capabilities, and the terminal's ability to identify itself to the host program, allow customer-supplied security program routines to help control access to data and aid audit of actions. A Magnetic Slot Reader (optional on 3279 mdls 02X or 03X only), or for a 3279 attached to a 3274, a Magnetic Hand Scanner (optional on 3279 mdls 02X or 03X only), are available to enter system user identification data.

Audible Alarm: An alarm, sounded under program control, to alert the operator to a special condition. This alarm, during keyboard operation, is also sounded when a character is entered into the next to last position on the screen. The operator may adjust the volume of the tone.

When attached to a 4331 Processor via the Display/Printer Adapter, functional support varies from that of the 3279 attached to a 3274 or 3276. See M4331 Display/Printer Adapter feature description for details of support.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This increased availability has been achieved through the use of problem determination and recovery procedures that are easily understood and used by the operator. The procedures are provided by the "User Reference Summary". Also, see "Customer Responsibilities".

Display Exception Monitoring Facility (DEMF) and the Program Product, Network Problem Determination Application (NPDA), are software tools for network problem determination/isolation which can enhance the availability and serviceability of the terminals. See "DEMF" in the SCP section for OS/VS1 and OS/VS2 (MVS), and 5735-XX8 in the PP section for NPDA.

Customer Responsibilities:

1. Adequate site, system and other vendor preparation.
2. Receipt at the customer's receiving dock, unpacking and placement of the 3279.

3. Physical setup, connection of cables in customer access areas, switch setting and check out.
4. Contacting CE to make cable connections of IBM CSU units to non-CSU units where customer access areas are not provided.
5. Notifying IBM of intent to relocate, and following IBM instructions for relocation.
6. Using and following the problem determination procedures and filling out trouble report prior to calling for IBM service.
7. Disconnection, packing and removal to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.

Refer to 3274 control storage requirement tables to ensure that adequate storage is available if required.

Publications: See "KWIC Index", G320-1621, or specific system bibliography.

Basic Configuration: The 3279 mdls S2A, S2B and S3G are only available with the following specifications. The 3279 mdls 02X and 03X will be shipped with these specifications unless alternative codes are specified.

- Power cable length: 9 foot.
- Cables - see "Accessories" for cable ordering information.
- The 3-digit Country Code entered on the DPMO Sheet will be used to select the most commonly used power plug in that country.

SPECIFY

- Power (AC 1-phase, 50/60 Hz). Specify #2998 and one of the following:
 - #2804 for input voltages between 100V and 120V.
 - If 127V is required, specify #2820 (not Japan).

Specify #2806 for input voltages between 200V and 230V. If 240V is required, specify #2801 (not Brazil or Japan). Canada must specify #2804.

- Canada only, specify #9890 for locking plug (60 Hz, 120V, 1-phase). Canada will use the same power cord and plugs as the US.
- For Japan only, for voltages under 200V, all mdls will be supplied with locking plug. Specify #9891 for non-locking plug if required.
- Power Cable: 3279 mdls 02X or 03X only, if the standard 2.8m (9 ft) power cable is not desired, specify: #9513 for 4.5m (15 ft).
- Power cable plug: 3279 mdls 02X or 03X only, if locking plug required, specify #9890. If the most commonly used power cable plug in the country is not desired, then a country RPQ may be initiated. For details concerning power plugs, refer to "IBM 3270 Information Display System Installation Manual - Physical Planning", GA27-2787. If a power supply, not the most common, is specified and it is incompatible with the power plug commonly supported, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.
- Machine nomenclature, character set and keyboard language: Defaults are as follows:

Country	Nomen- clature	Character Set and K/B Lang.
Argentina	Sp. Spkng	Sp. Spkng
Bolivia	Sp. Spkng	Sp. Spkng
Chile	Sp. Spkng	Sp. Spkng

Colombia	Sp. Spkng	Sp. Spkng
Costa Rica	Sp. Spkng	Sp. Spkng
Dominican R.	Sp. Spkng	Sp. Spkng
El Salvador	Sp. Spkng	Sp. Spkng
Ecuador	Sp. Spkng	Sp. Spkng
Guatemala	Sp. Spkng	Sp. Spkng
Honduras	Sp. Spkng	Sp. Spkng
Mexico	Sp. Spkng	Sp. Spkng
Nicaragua	Sp. Spkng	Sp. Spkng
Panama	Sp. Spkng	Sp. Spkng
Paraguay	Sp. Spkng	Sp. Spkng
Peru	Sp. Spkng	Sp. Spkng
Uruguay	Sp. Spkng	Sp. Spkng
Venezuela	Sp. Spkng	Sp. Spkng
Brazil	Brazilian	Brazilian
Japan	Japanese	Specify Code
Canada	Can. Biling.	English US
Others	English	English US

- Keyboard language and character set: For all countries, if another language is required, specify as follows:

Brazilian #2975
Canadian/French #2977
EBCDIC #2951
English UK #2958
English US #2956
International #2950
Japanese English #2955 (1)
Japanese Katakana #2973 (2)
Spanish Speaking #2969

1. Japanese English applies only to keyboards #2708, #2715, #2717, #2718, #2719, #2721, #4622, #4623.

2. Japanese Katakana applies only to keyboards #2708, #2715, #2716, #2717, #2718, #2719, #2721.

- Katakana Support: 127 characters (plus space and null). Support is an enhancement of previously announced 3270 Japanese Katakana. This enhancement may not be 3270 compatible for customers using the NL and EM codes. Customers who do not use these codes will be 3274 and 3276 compatible. For details, see appropriate SRLs.

- Keyboard Language: All 3279s in a 3274/3276 cluster must specify the same keyboard language as that used on the 3274/3276. The keyboard language for 3279s on a 4331 must correspond with one of the language options specified on the 4331.

SPECIAL FEATURES

(Canada only> IBM Personal Computer Adapter (#5322, #5325, #5326, #5327, #5328): (Features #5325, #5326, #5327, and #5328 are NO LONGER AVAILABLE). This entry is for information purposes only -- see Product Announcement Letter. <) (Canada only> for ordering instructions and prices. Provides the capability of attaching an IBM Personal Computer, 5150, System Unit to the 3279. For 3279 mdls S2A, S2B, 02X with serial numbers below E0000 order #5325 and for serial numbers above E0000 order #5326. For 3279 mdls S3G and 03X with serial numbers below M0000 order #5325 and with serial numbers above M0000 order #5326. #5325 and #5326 contains material for both the 3279 and the IBM Personal Computer System Unit. If only the 3279 portion is required, then for the ranges of 3279 serial numbers quoted, order #5327 or #5328 respectively. If only the IBM Personal Computer 5150 portion is required, order #5322. The interconnection cables and user's guide with the Programming Diskette are included with the Personal Computer option #5322. A user's guide without the Programming Diskette may be ordered from Mechanicsburg, PA using Form SA23-0169. Maximum: One. Prerequisites: (1) 3279 mdls S2A or S2B or S3G or 02X or 03X. (2a) IBM Personal Computer, 5150, X14, X64, or X74 with Color/Graphics Monitor Adapter, or (2b) IBM Personal Computer System Unit, 5150 with Color/Graphics Monitor Adapter, 5-1/4 inch

Diskette Drive Adapter and one 5-1/4 inch Diskette Drive, and at least 64KB total user memory. (3) IBM Personal Computer DOS 1.1 or DOS 2.0. (4) a 3274 or 3276 control unit. Limitations: Cannot be installed with #4999, #6360 or #8750 -- also see M3274 pages. Field Installation: Yes (only). Contact < (Canada only) > CE < (Canada only) > for installation. For installation of the feature on other 3279 mdls, refer to other M3279 pages. <)

Programmed Symbols (#5790): (Provided with 3279 mdl S3G) This feature provides storage and accessing for up to six 190-symbol sets whose shapes and codes are customer-definable. Symbol sets are loaded under program control and accessed for display through programming or by an operator from the display keyboard. The number of symbols in any one set that can be accessed from the display keyboard is 94 or 116 for Canadian French, or 127 for Japanese Katakana, plus space. Prerequisites: 3279 mdl 03X with #3850. Maximum: One. Field Installation: Yes, on 3279 mdl 03X only. Limitations: (Canada only) > Mutually exclusive with Magnetic Reader Control #4999. See Note 1 under #4999, below. <) Can be used only with a 3274 having the PS Control and Structured Field and Attribute Processing options of Configuration Support C or D. Transient patterns are displayed when data is being loaded to the Programmed Symbols buffers. Corequisites: If display operator access to PS is required, one of the following keyboards must be ordered:

- 87-key EBCDIC Typewriter Overlay Keyboard (#4640).
- 87-key EBCDIC Attribute Select Typewriter Keyboard (#4651) or 87-key EBCDIC Attribute Select Typewriter/APL Keyboard (#4652).
- 88-key Attribute Select Japanese English/Japanese Katakana Typewriter Keyboard (#2708).
- 88-key Japanese English/Japanese Katakana Typewriter Overlay Keyboard (#2719).
- 88-key Attribute Select Japanese English/Japanese Katakana Typewriter/APL Keyboard (#2721)

THE FOLLOWING SPECIAL FEATURES ARE ONLY AVAILABLE ON THE 3279 MDL 02X OR 03X

Inhibit Keyboard Numeric Lock (#4691): This feature prevents the action of the Keyboard Numeric Lock function which is described at the beginning of the keyboard section. Prerequisites: 3279 mdls 02X or 03X only, and at least one of the following keyboards: #2715, #2716, #2717, #2718, #4621, #4622, #4623, #4626, #4627, #4629. Maximum: One. Field Installation: Yes. Contact CE for installation. MES Number 999999 is to be used for IR (incident report) completion data.

Extended Function (#3850): (Provided with 3279 mdls S2B and S3G) This feature provides Extended Color (red, blue, green, white, yellow, turquoise and pink) and Extended Highlighting (reverse video, blink, underscore). It also provides capability for display of 222 character APL/Text character set including the 94/116/127 character EBCDIC set. Prerequisites: 3279 mdls 02X or 03X. Maximum: One. Field Installation: Yes, on 3279 mdls 02X and 03X only. Limitations: APL/Text requires a 3274 mdl X1A, X1C, or X1D, customized to include APL/Text control function, or a 3276 with APL/Text control feature and its prerequisite, Extended Function feature. Extended Color and Extended Highlighting require the Structured Field and Attribute Processing option of Configuration Support C or D on the 3274.

Magnetic Reader Control (#4999): Provides the capability of attaching a Magnetic Slot Reader or a Magnetic Hand Scanner which read encoded information from a magnetic stripe. The MSR can be used when the 3279 is connected to either a 3274 or 3276, but the MHS can only be used when the 3279 is connected to a 3274 Control Unit. Prerequisites: 3279 mdls 02X and 03X. (Canada only) > Limitations: Mutually exclusive with Programmed Symbols #5790. See Note 1 below. <) Maximum: One. Field Installation: Yes, on 3279 mdls 02X and 03X only. (Canada only) > Limitations: Cannot be installed with #5325 or #5326. <)

Selector Light-Pen (#6360): Hand-held, pen-like device which permits the operator to select fields of data from a display for input to the host system. The selector light-pen will detect on any color. The selector light-pen, while not being used, can be placed in a recess of the keyboard which is provided for user's incidental items. Se-

lector light-pen (and cursor select) operations have been expanded to include a designator character '&'. When this designator is used, the Read Modified operation returns both the addresses and the data of all modified fields on the screen. Prerequisites: 3279 mdls 02X and 03X. Maximum: One. Field Installation: Yes, on 3279 mdls 02X and 03X only. (Canada only) > Limitations: Cannot be installed with #5325 or #5326. <)

Video Output (RPQ 7J0039): (Canada only) > Note 1. This limitation does not apply to field installation on machines below serial number M0000. These features are available for concurrent installation by RPQ 7J0089 factory only. <)

Summary of Special Feature Availability:

Special Features	No.	3279 Mdls					
		S	S	S	O	O	
		2	2	3	2	3

IBM Personal	#5325	O	O	O	O	O	
Computer Adapter	#5326	O	O	O	O	O	

N = Not Available

S = Standard

O = Optional

(1) Prerequisites: #3850.

88-key Attribute Sel. Jap. Eng./Jap. Kat. T/W KB (#2708): Typewriter layout, movable, similar to the 88-key Japanese English and Japanese Katakana typewriter keyboards (#2717). Attribute select functions are shown on the 12 PF keys at the right-hand side of these keyboards. Prerequisites: 3279 mdls 02X or 03X with #3850 and #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

76-key Jap. Eng./Jap. Kat. T/W KB (#2715): Typewriter-like layout, movable. 12 PF keys are available in the top row of data keys through use of an alternative shift key. The 76-key Japanese English Typewriter Keyboard provides 49 data keys and 27 control keys. Prerequisites: #2955 or #2973.

76-key Jap. Kat. Data Entry KB (#2716): Movable, 4-level shift providing 49 data keys, 10 PF keys and 27 control keys. Prerequisites: #2973.

88-key Jap. Eng./Jap. Kat. T/W KB (#2717): Typewriter-like layout, movable, with 49 data keys, 26 control keys and 12 PF keys (24 total PF keys). 12 of the PF keys are available in the top row of data keys through the use of the alternate shift key. The Japanese Katakana keyboard provides 4-level shift, 49 data keys and 27 control keys. Prerequisites: #2955 or #2973.

88-key Jap. Eng./Jap. Kat. T/W/APL KB (#2718): An 88-key Japanese English/Japanese Katakana Typewriter Keyboard (see #2717) with modified keytops to allow entry of 81 APL-specific characters in addition to the basic character set Japanese English or Japanese Katakana. An APL ON/OFF key controls whether the keyboard is in APL or basic character set mode. In contrast to the 88-key Japanese English/Japanese Katakana Typewriter Keyboard without APL (see #2717), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard area. Prerequisites: 3279 mdls 02X or 03X with #3850 and #2955 or #2973.

88-key Jap. Eng./Jap. Kat. T/W Overlay KB (#2719): This keyboard, without overlay, has the same layout and can be used in the same way as the 88-key Japanese English/Japanese Katakana Typewriter Keyboard (see #2717). This keyboard, however, has special narrow keytops to permit the use of customer-annotated overlays. Six overlays are supplied with each keyboard. Additional overlays can be obtained via MES (see "Accessories"). These overlays are used

to show the symbols associated with the keys when one of the sets of Programmed Symbols is selected. The desired PS can be selected by the operator through use of the appropriate PF keys in uppercase and alternative shift on this keyboard. Overlay keyboards are equipped with highlight, PS and color select function keys. (12 PF keys on the right-hand side of the keyboard.) Prerequisites: #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

88-key Attribute Sel. Jap. Eng./Jap. Kat. T/W/APL KB (#2721) Typewriter layout, movable, similar to the 88-key Japanese English and Japanese Katakana Typewriter/APL Keyboard (#2718). Attribute select functions are shown on the 12 PF keys at the right-hand side of these keyboards. Prerequisites: 3279 mdls 02X or 03X with #3850 and #2955 or #2973. Limitations: Cannot be installed on a 3279 that is attached to a 3276.

75-key EBCDIC Typewriter KB (#4621): Typewriter-like layout, movable, with 49 data keys and 26 control keys. 12 PF keys are included in the top row of data keys through of an ALT shift key. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

75-key EBCDIC Data Entry KB (#4622): Movable, with 35 data keys, 10 PF keys and 30 control keys. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

75-key EBCDIC Data Entry KB (#4623): Keypunch layout, with 35 data keys, 10 PF keys and 30 control keys. This is the recommended keyboard for high speed data entry. Prerequisites: 3279 mdl 02X or 03X. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

87-key EBCDIC Typewriter/APL KB (#4626): An 87-key EBCDIC Typewriter Keyboard (#4627) with modified keytops to allow entry of 81 APL-specific characters in addition to the 94-character EBCDIC set. An APL ON/OFF key controls whether the keyboard is in EBCDIC typewriter or APL mode. In contrast to the 87-key EBCDIC Typewriter Keyboard without APL (see #4627), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard area. Prerequisites: 3279 mdls 02X or 03X with #3850. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

87-key EBCDIC Typewriter KB (#4627): Typewriter-like layout, movable, with 49 alphanumeric data keys, 26 control keys and 12 PF keys (24 total PF keys). 12 of the PF keys are included in the top row of data keys through the use of the ALT shift key. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

87-key EBCDIC Typewriter/Text KB (#4629): An 87-key EBCDIC Typewriter Keyboard (see #4627) with modified keytops to allow entry of 65 text-specific characters in addition to the 94-character EBCDIC set. A Text ON/OFF key controls whether the keyboard is in EBCDIC typewriter or Text mode. In contrast to an 87-key EBCDIC Typewriter Keyboard without Text (see #4627), this keyboard has only 12 PF keys (PF1 through PF12) which are the group of 12 keys to the right of the main keyboard areas. Prerequisites: 3279 mdl 02X or 03X with #3850. Keyboard language - English US (#2956) only.

87-key EBCDIC Typewriter Overlay KB (#4640): This keyboard, without overlay, has the same layout and can be used in the same way as the 87-key EBCDIC Typewriter Keyboard (see #4627) with the 94-character EBCDIC set. This keyboard, however, has special narrow keytops that permit the use of customer annotated overlays. Six overlays are supplied with each keyboard. Additional overlays can be obtained via MES (see "Accessories"). These overlays are used to show the symbols associated with the keys when one of the Programmed Symbols is selected. The desired PS can be selected by the operator through use of the appropriate PF keys (12 PF keys on the right-hand side of the keyboard) in uppercase and alternate shift of this keyboard. Prerequisites: 3279 mdls 02X and 03X. Limitations: Cannot be installed on a 3279 attached to a 3276. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

87-key EBCDIC Attribute Select Typewriter KB (#4651): A typewriter layout, movable, similar to the 87-key EBCDIC typewriter keyboard (#4627). Attribute select functions are shown on the 12 PF keys at the right-hand side of the keyboard. Prerequisites: 3279 mdls 02X or 03X with #3850. Limitations: Cannot be installed on a 3279 attached to a 3276. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

87-key EBCDIC Attribute Select Typewriter/APL KB (#4652): A typewriter layout, movable keyboard, similar to the 87-key EBCDIC typewriter/APL keyboard (#4626). Attribute select functions are shown on the 12 PF keys at the right-hand side of the keyboard. Prerequisites: 3279 mdls 02X or 03X with #3850. Limitations: Cannot be installed on a 3279 attached to a 3276. (Except Japan>Specify optional language if required.<) (Japan only>Specify language required.<)

MODEL CONVERSIONS

MES orders to change models S2A or S2B to 02X and S3G to 03X will be accepted 90 days after installation.

From/To	S2A	S2B	S3G	02X	03X
S2A	--	No	No	Yes	No
S2B	No	--	No	Yes	No
S3G	No	No	--	No	Yes
02X	No	No	No	--	No
03X	No	No	No	No	--

Note: Models S2B, S3G, and 03X are not supported by S/3.

ACCESSORIES

For shipment with machine, order the feature number as shown below. See detailed description below for additional information and for ordering by MES for field installation.

Item	Feature No.	P/N	Max Qty
Magnetic Hand Scanner	#9440	4123495	*
Magnetic Slot Reader	#9441	4123500	*

* A maximum of one magnetic reader or scanner may be ordered.

Magnetic Reader Extension Cable for use with Magnetic Hand Scanner or Magnetic Slot Reader:

Item	Feature No.	P/N	Max Qty
6m (20 ft)	#9106	4832986	**
12m (40 ft)	#9107	4832987	**

** A maximum of one extension cable may be ordered.

Item	Feature No.	P/N
Tilt/rotate accessory	N/A	4422265
Control Unit Switch	MES only	
Battery	N/A	

The following cable assemblies can be used to extend the Magnetic Hand Scanner and Magnetic Slot Reader distances. Limitations: Extension cables cannot be plugged into other extension cables. Prerequisites: #4999.

Item	Feature No.	P/N
6m (20 ft)	#9106	4832986

12m (40 ft) #9107 4832987

If ordering by MES for field installation, one of the following manuals should be ordered. English manual is always supplied. The MSR/MHS customer service manuals, and their form numbers, are:

French GA11-0007
Spanish GA10-8101
Japanese NGA24-3663

Both the MHS and the MSR read magnetically encoded information from an alphanumeric character set. The MSR also reads the same 10-character numeric only set as the 3277 Operator Identification Card Reader (#4600) which is not a subset of the alphanumeric character set. For a further description of both character sets, see "IBM 3270 Information Display System Character Set Reference", GA27-2837. Either (not both) the alphanumeric or the 10 numeric only 3277-like character set may be selected for the 3274 at customization time for attached 3278s and 3279s. The 3276 and attached 3278s and 3279s support only the MSR and the 10-character numeric only set as used by the 3277.

Numeric and alphanumeric character capabilities are as follows:

MSR/ MHS	Minimum number of Hex Codes	Maximum number of characters	Density	
	between start and end sentinel chars		Bits per inch	Bits per mm
3277- Like 10-num char set*	7 7	37 118	75 127	3 5
Alpha- meric char set*	7 7 7 7	37 num 18 non-num 118 num 59 non-num 37 num	75 75 127 127 210**	3 3 5 5 8.3

* 1 Hex code = 1 numeric character
2 Hex codes = 1 non-numeric character
** MSR only

Full width encoding is recommended for the MSR and is required for the MHS.

Maximums shown are ALL numeric or ALL non-numeric characters. If a combination of numeric and non-numeric characters is recorded, the total number of hex CODES must not exceed the numeric character maximum. For example, at 127 bpi, a combination of 60 numeric and 20 non-numeric character is permissible.

Limitations: 3277-like 10 character set numerics only magnetic cards coded with Alternate End or Message character (hexadecimal 'C'), cannot be read by the MSR or MHS. The alphanumeric character set and the MHS are only supported on 3278s and 3279s which are attached to 3274s. IBM Host Programming Support is provided for alphanumeric character set non-protected, display data entry. Protected, non-display data entry is supported by IMS and TSO. With this protected, non-display data entry support, all cards and documents which can be read by the 3630 Plant Data Communication System, up to 118 data characters, can be read by the 3270 System.

A variety of magnetic documents, tags and labels which the MSR and MHS can read, may be obtained from NDD, some of which, depending on length, can be encoded by devices such as the 3642 Encoder Printer. Except in the UK, for complete information on the availability of pre-encoded magnetic striped plastic cards, contact an NDD Sales Representative.

Switch Control Unit: Permits switching operational control of a 3279 between two different control units. Customer is responsible for

Procurement and installation of this accessory, and also for the replacement of a defective unit. **Warranty:** The Switch Control Unit is warranted free from defects in workmanship and materials for 90 days. **Maintenance:** There is no regularly scheduled maintenance recommended by IBM, and IBM Maintenance Agreements are not available. **Ordering Instructions:** This accessory is ordered by P/N via MES for field installation only. One of the following P/Ns should be ordered when ordering by MES for field installation.

English 4419338
Canadian French 4419343
Japanese 4419346
Brazilian/Portuguese 4419348
Spanish 4419349

Lithium Battery (P/N 6042018): This supply item is a 3.0 Volt non-rechargeable lithium battery which provides power to sustain the convergence parameters in a 3279 when normal power is not present. **Field Installation:** Yes, by customer. **Note:** Discharged batteries should be returned to IBM for disposal, return information is printed on the label. **Ordering Information:** Order by DP Supply Order from Mechanicsburg.

Keyboard Overlay (P/N 1742762): A keyboard overlay is available on which customer-defined Programmed Symbols can be annotated. An annotated overlay can be placed over the narrow keytops of Overlay keyboards to associate specific keytops with specific symbols.

88-Keyboard Overlay P/N 1742781

Keys (P/N 4420756): The 3279 with Security Keylock is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys only to original purchaser). A letter of authorization, with key identification (on customer metal tag), must accompany each order. Allow two to three weeks for delivery.

Magnetic Hand Scanner (#9440, P/N 4123495): The Magnetic Hand Scanner (MHS) attaches by a 1.5m (5 ft) coiled cable to a 3279 that has an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. It can read a stripe in either direction. **Field Installation:** Yes. **Prerequisites:** #4999. See Note 1 under #4999.

Ordering Instructions: When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking: For 50 scanners, 2 spares; for 100, 3; for 150, 4; for 200, 5.

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days. In countries other than Canada, warranty service for the Magnetic Scanners will be preformed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a Time-and-Material basis from CE other than Canada. In Canada,

optional IBM maintenance is available on a time-and-materials basis at the Repair Center. Authorization Form #2110 applies

Magnetic Slot Reader (#9441, P/N 4123500): The Magnetic Slot Reader (MSR) attaches by a 1.5m (5 ft) cable to a 3279 that has an appropriate magnetic adapter feature. The slot reader accommodates a wide range (height and length) of magnetic striped card stock and plastic badges including job tickets, magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc. The MSR has three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. Field Installation: Yes. Prerequisites: #4999. See Note 1 under #4999.

Ordering Instructions: For delivery with machine, see above. When ordering via MES, order from Raleigh.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking: For 50 readers, 2 spares; for 100, 3; for 150, 4; for 200, 5 spares.

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a time-and-material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time-and-material basis at the Repair Center. Authorization Form #2110 applies.

A Magnetic Reader attachment feature on the appropriate machine is required to use the Magnetic Slot Reader.

Magnetic Slot Reader, P/N 4123500 or feature code #9441

Magnetic Reader/Scanner Extension Cables: These cable assemblies can be used to extend the Magnetic Hand Scanner P/N 4123495 or Magnetic Slot Reader P/N 4123500 distances. Additional Extension Cable lengths other than those listed below are available. Warranty: MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. Limitations: Extension cables cannot be plugged into other extension cables.

6m (20 ft) P/N 4832986
12m (40 ft) P/N 4832987

Magnetic Reader/Scanner Replacement Assemblies:

MHS Sensor Head Assembly 4832721
MHS Handle and Feedback Assembly 4832701
MHS Amplifier Card & Cable Assembly 4832722
MSR Arm and Sensor Head Assembly 4832963
MSR Base and Feedback Assembly 4832973
MSR Amplifier Card & Cable Assembly 4832962
MSR Cover 4832964

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking:

Magnetic Hand Scanner Replacement Assembly Stocking:

Number of MHSs	Sensor Head	Handle & Feedback	Amp Card
	P/N	Assy P/N	Assy P/N
4123495	4832721	4832701	4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader Replacement Assembly Stocking:

Number of MSRs	Arm and Sensor Head	Base & Feed-back	Ampli. Card & Cord	Cover
	P/N	Assy P/N	Assy P/N	P/N
4123500	4832963	4832973	4832962	4832964
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Ordering Instructions: Order from CE Stockrooms. See Instruction Letter ZM77-0038, DPCE letter #27 dated October 19, 1977.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

Display Station Keyboard Accessories: The following keyboard accessories allow customers to define and change the messages on single position keytops of the 3279 keyboards. These accessories supply keytops only and do not change any characters or functions of the display station. The accessories consist of legendable keytops, blank keytops for customer engraving, a keytop extractor, and an Entry Assist Keytop kit. (Canada only> These accessories may be ordered by P/N via a DP Supply Order from the Raleigh plant.<)

(Canada only> These accessories should be bulk ordered by P/N on a P&SR from the plant of manufacture. Individual customer requirements should be satisfied from local country stock.<)

Legendable Keytop: The legendable keytop consists of two parts: A molded key base and a clear plastic cover. The user may define unique keytop messages by writing on a piece of paper, affixing the paper to the keytop base and sliding on the clear plastic cover. The keytop is available in three colors and with top keyboard row contour only. (Example: Clear Key.)

White 5188775
Charcoal Gray 8627192
Light Gray 8542831

Blank Keytop: The blank keytop is for a customer to engrave with desired nomenclature. The keytop comes in three colors and is available with top keyboard row contour only. (Example: Clear Key.)

White 1853775
Charcoal Gray 1853567
Light Gray 1853563

Keytop Extractor (P/N 9900373): The keytop extractor is a small tweezer-like device which fits between the keytops. With a firm squeezing grip on a keytop, the keytop can be pulled of its stem. The customers should use the extractor whenever a keytop is to be removed from a keyboard.

Entry Assist Keytop Kit: (Non-overlay keyboards only) This kit provides eight sets of five keytops appropriately labelled for use with the Entry Assist capability together with a keytop extractor and

keytop replacement instruction. Not for use on 3178 keyboards or overlay keyboards.

Brazil 4942307
Canadian Bilingual 4942308
International, EBCDIC/WT 4942311
Japanese English 4942315
Spanish Speaking 4942318
English UK 4942312
English US 4742774

Display Station Tilt/Rotate Accessory (P/N 442265): An accessory which fits under the display station and provides a ball and socket type movement to allow the angle of the screen face to be adjusted for comfort of viewing position. The screen angle is normally 20 degrees from the vertical but with this device it can be adjusted between 25 degrees to the vertical and the vertical position. A locking device is provided to maintain the selected position. This accessory also allows the display station to be rotated plus or minus 90 degrees from the central position and this movement is independent of the tilt movement.

For the countries in which it is released, the Tilt Rotate Accessory is an NDD Product.

Warranty: The Tilt Rotate accessory is warranted free from defects in workmanship and materials for 90 days.

Maintenance: There is no regularly scheduled preventive maintenance recommended by IBM, and IBM Maintenance Agreements are not available.

Customer Responsibility: The customer is responsible for mounting the Display Station on this accessory.

Cables: IBM shielded twisted pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

- Twisted pair cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation with your country.

- Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787, and "Coaxial Cable and Associated Manual", GA27-2805.

- Assm 2577672 Cable Assembly In-Door
- Bulk 0323921 Coax Wire (Note 1)
- P/N 1836418 Connector Kit (Note 1)
- Assm 1833108 Cable Assembly Out-Door
- Bulk 5252750 Coax Wire (Note 2)
- P/N 1836419 Connector Kit (Note 2)
- P/N 1833104 Station Protector Kit, Carbon (Note 4)
- P/N 2621414 Modification Kit (Note 3)
- P/N 1833106 Station Protector Attachment Kit (Note 5)
- P/N 5252772 Station Protector Element Carbon (Note 6)
- P/N 5252643 Adapter (Note 7)
- P/N 1830818 Station Protection Kit, Gas (Note 4)
- P/N 5252899 Station Protector Element, Gas (Note 6)

Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.

Notes:

1. Coax wire and one connector kit (includes two connectors P/N 1836446) required for each indoor cable assembly.
2. Coax wire and one connector kit (includes two connectors P/N 1836447) required for each outdoor cable assembly.
3. Customers replacing 2260 display stations may utilize the existing installed cables by use of this modification kit. One kit required for each cable.
4. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
5. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
6. Replacement station protector elements.
7. Use to join two P/N 2577672 or two P/N 1833108 cable assemblies together.

SUPPLIES (NONE)

MACHINES
3284 PRINTER MDL 3
Models 1 and 2 have been withdrawn from marketing
PURPOSE

Provides hard copy output at a speed of 40 cps.

MODELS
Model 3 003 Attaches to and uses the storage buffer of a 3275 Display Station model 3.

Prerequisites: A 3275 mdl 3 with Printer Adapter (#5550).

HIGHLIGHTS

The 3284 printer provides hard copy output at a speed of 40 cps, using the EBCDIC character set. Mdl 3 prints the contents of the buffer of the 3275 Display Station at a speed of 40 cps.

The unit has a pinfeed platen which permits the feeding of marginally punched continuous forms paper. 120-, 126-, and 132-position print lines may be specified ... see "Specify". Line spacing is 6 lines/inch. Matrix characters are formed by 7 vertical wires printing dots in up to 4 of 7 possible horizontal positions. Use of the underscore in conjunction with another character will overprint the lowest dot in that character and is not recommended. Refer to GA24-3488 for forms design considerations and limitations. Up to 6-part forms can be printed with a maximum thickness of .018 inches. Forms lengths can be 3 inches to 14 inches in increments of 1/6 inch. Card stock continuous forms are not recommended.

Notes:

- (1) For optimum feeding, stacking, and legibility, forms of no more than three parts should be used.
- (2) Katakana character font is formed by 8 vertical wires printing dots in up to 5 of 9 possible horizontal locations.

Bibliography: See *KWIC Index*, G320-1621, or specific system bibliography.

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730 (Japan only)
110V #2805	115V #9901
123.5V #2811	
220V #2813	
235V #2814	

For Japan only: Specify #9890 for locking plug or #9891 for non-locking plug for voltages under 200V.

- Machine Nomenclature [plant installation only]:

English UK #2927	Italian #2932
English US #2750	Japanese #2930
French #2928	Spanish #2931
German #2929	

- Character Generator Language: Select one of the following unless the Katakana Character Generator feature is required. See "Special Features". If dual case character set is required, refer to RPO listing.

Austrian	#2704 - Monocase
Belgian	#2705 - Monocase
Belgian	#2709 - Dual Case
Danish	#2710 - Monocase
Finnish	#2708 - Monocase
French	#2705 - Monocase
French	#2709 - Dual Case
German	#2704 - Monocase
Italian	#2702 - Monocase
Italian	#2702 - Dual Case
Norwegian	#2710 - Monocase
Portuguese	#2712 - Monocase
Spanish Speaking	#2714 - Monocase
UK English	#2703 - Monocase
US English	#2705 - Monocase

- Pinfeed Platen:

#9167 for 120 print positions (12-1/2" hole-to-hole)
#9162 for 126 print positions (13-1/8" hole-to-hole)
#9168 for 132 print positions [uses non-standard paper]
(13-7/8" hole-to-hole)

Note: Do not order #9167 or #9168 unless paper is available in your area.

SPECIAL FEATURES
Katakana Character Generator (#2706): Provides the ability to print the characters described on the Katakana Keyboard. **Prerequisites:** #2707 on 3271, 3272, 3275. **Field Installation:** No.

TERMS and CONDITIONS

Plan Offering: Plan B
Purchase Option: 60%
Base Term: 24 months
Machine Group: A
Warranty: B
Per Call: 1
Term Plan: 24 months

Termination Charge Percent: 25%
Termination Charge Months: 5
(Canada only+ Upper Limit Percent:
5% +)

Non-Field Installable Feature/
Model Conversions: Yes

MODEL CONVERSIONS

Model 3 is field-installable on the 3275.

ACCESSORIES

The following item is available on a purchase-only basis. For shipment with machine, order the feature number indicated below.

Forms Stand (#4450): Permits placement of continuous forms (out of carton) on stand above floor and provides for stacking after printing.

SUPPLIES
Ribbons: A black ribbon (P/N 1136970), or equivalent, must be used.

3287 PRINTER MODELS 1, 2

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

Provides hard copy output. The 3287 mdls 1 and 2 attach to a 3271 mdl 1, 2, 11 or 12, or a 3272 mdl 1 or 2, or a 3791 Controller, or a 3274 (all mdls), or a 3276 mdl 1, 2, 3, 4, 11, 12, 13 or 14, or an 8775 or 3601, 3602, 3694, or 4701 mdl 1 or 2, the 8101 Storage and Input/Output Unit of the 8100 Information System, or the 3814 Switching Management System mdl A. The 3287 mdl 1 or 2 also attaches directly to the 4341 Processor, to the 4331 or 4361 Processor via Display Print Adapter, or Workstation Adapter to the 3081/3083/3084 Processor through the 3082 Processor Controller, to the 3090 Processor through the 3092 Processor Controller, and to the S/370 mdl 138 or 148 via the Integrated Console Printer Adapter, and to the 9370 via the Workstation Subsystem Controller.

MODELS 1, 2

Model 1 001: 80 cps maximum bidirectional printer

Model 2 002: 120 cps maximum bidirectional printer

Note: Actual printer throughput is dependent upon operational and system characteristics. Factors such as controller configuration and line transmission speed, output format, and programming application processing must all be considered in determining actual throughput.

Prerequisites:

3287 Att.	Device Adapter on Control Unit
3271/ 3272	#8330 Available port or added #3250
3274	#8331 Type A or B Adapter or #8330(see M3274 pages)
3276	#8331 Available port or added #3255, #3256, #3257
3791	#8330 Available port or #7911 #7912 or added #7912
3138/ 3148	#8330 Integrated Console Printer Adapter
3081/ 3083/ 3084	#8331 Attaches through a 3082 Processor Controller
3090	#8331 Attaches through a 3092 Processor Controller
3601/ 3602/ 3694/ 4701	#8331 Dev Cluster Adpt #3101
3814	#8331 Attaches through 3814 Display/Printer Attchmt #1420
4331/ 4361	#8331 Available port on Display/Printer Adapter

or Workstation Adapter
on the 4361

4341/ 4381	#8331 Available console position on 4341/4381
8101	#8330 Available port on Display/Printer Attachment #3220 or added #1506
8775 9370	#8331 #5580 #6020 Workstation Subsystem Controller

Customer Setup (CSU): The 3287 is designated as Customer Setup thereby offering the customer early availability and relocation flexibility. For additional information on CSU, contact IBM.

HIGHLIGHTS

The 3287 consists of control functions, printer and indicator lights in one integrally designed desk-top unit. Special features are available which permit tailoring of the printer to the user's requirements.

Where the 3287 replaces a 3284 or 3286, the Variable-Width Forms Tractor (special feature) is used in lieu of the Pinfeed Platen or Forms Tractor RPQ WD4031. In addition Friction-Feed Paper Handling is available as a special feature.

Control Functions: Provides the control for all online operations. This unit requires the 3271/3272 Attachment (#8330) for receiving data from a 3271/3272, or a 3790 Communications System, or a 3274 through Terminal Adapter B, or a S/370 mdl 138/148 (Integrated Console Printer Adapter), or the 3274/3276 Attachment (#8331) for receiving data from a 3274 through Terminal Adapter Type A, or through the 8101 Storage Input/Output Unit of the 8100 Information System, or the 3814 Switching Management System mdl A, or a 3276, or an 8775 or a 4361, 4331 or 4361 Processor Display/Printer Adapter or Workstation Adapter on the 4361 or a 4341 Processor, or a 3082 Processor Controller, or a 3601 or a 3602 Controller, or the 3694 Document Processor of the 3600 Finance Communication System, or a 4701 mdl 1 or 2 Controller of the 4700 Finance Communication System.

Printer: Maximum printer throughput is obtained with bidirectional serial matrix printing and indexing without unnecessary print head movement. The printer dot matrix is 4 of 7 wide by 8 high giving high legibility with character spacing at 10 to the inch. Line spacing is 6 and 8 lines to the inch. Up to 132 characters can be printed in a line. Up to 6-part forms with total thickness of 0.457mm (0.018 inches) may be used. For any multi-part or pre-printed continuous forms the Variable-Width Forms Tractor (#8700) is recommended. 5- and 6-part continuous forms should be tried on an individual basis for acceptable feeding, registration and print quality.

The Friction-Feed Paper Handling (#4110) is recommended for use with non-preprinted single part roll or fanfold paper, with a minimum width of 203mm (8 inches), when the Variable-Width Forms Tractor (#8700) is not used. Maximum overall forms width is 378mm (14-7/8 inches); card stock forms are not recommended. (See GA24-3488 for forms specifications and limitations).

Audible Alarm, Mono/Dual case, Single/Double line spacing, 6 or 8 Lines Per Inch, Page Length Selector Control Switches, and Maximum Print Position are standard functions. Audible Alarm (activated under program control) and Dual Case are not supported by S/370 mdls 138/148 as a Console Printer, or when attached to any 4300 processor. Mono/Dual switch is inoperative when the 3287 is operating in SCS (SNA Character String) data stream mode or when copying from a display or when operating in APL or PS mode. Mono/Dual switch is not supported for Katakana. Refer to

MACHINES

GA27-2837, "IBM 3270 Information Display System Character Set Reference".

Problem Determination Procedure: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem determination and recovery routines and procedures that can be understood and used by the operator. See "Customer Responsibilities" below.

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system and other vendor preparation.
2. Receipt at the customer's receiving dock, unpacking and placement of the 3287.
3. Physical setup, connection of cables, switch settings and checkout.
4. Contact CE to make cable connections of IBM CSU units to IBM non-CSU units where customer access areas are not provided.
5. Notify IBM of intent to relocate and follow IBM instructions for relocation.
6. Use and follow the problem determination procedures and fill out trouble report prior to calling for IBM service.
7. Disconnecting, packing and removing to the customer shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.
8. Providing a desk or table top to support the 3287.

Forms Handling: Variable-Width Forms Tractor (#8700) or Friction Feed Paper Handling (#4110) must be ordered for each 3287 mdl 1 or 2. VWFT is recommended for the System Console Printer.

Publications: See KWIC Index, GA20-1621, or specific system bibliography.

SPECIFY

Specify Features (For details, see "Specify Descriptions")

3287 Attachments:

- A = 3271/3272 Control Unit
- B = 3274 Control Unit
- C = 3276 Control Unit Display Station or 8775 display station
- D = 3791 Controller
- E = S/370 mdl 138/148
- F = 8100 System (8101 Attach)
- G = 4331,4341, 4361 Processor
- H = 3600 System (3601/3602/3694 Attach or 4700 System (4701 attach))
- I = 3081/3083/3084 Processor

Notes:

1. Do not specify if Data Analysis-APL Feature (#1066) is selected for attachment to the 3271 or 3272.
2. For Terminal Adapter Type B on the 3274, select from #9520 and #9522 for Character Print Operations. Specify features #9521, #9523, #9524, #9525 and #9660 cannot be selected for Terminal Adapter Type B. For Terminal Adapter Type A, #9520 is not available. For the attachment to a 3274 mdl 52C, specify features #9520, #9523 and #9524 cannot be selected.
3. Not valid when the 3287 is attached to a 3274 using Configuration Support A #9110.

Specify Descriptions:

- (Canada only> Administrative Order Control: #9010 is required as administrative prerequisite for specific features, used to differentiate manufacturing level of machine.<)
- Plugs: The 3-digit country code on the DPMO is used to select a power plug which matches the most commonly used power supply in that country. If an exception to the above is required, a country RPQ may be initiated. For Japan and Canada: Specify #9890. (Canada only> Limitations: Not available on machines with serial number N0000 and later. Prerequisites: #9010<) for locking plug or #9891 for nonlock-

ing plug. For details concerning power plugs, refer to "IBM 3287 Printer - Planning and Setup Guide", GA18-2018. Note: If a power supply, not the most common, is specified and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.

Canada will use the same power cords and plugs as used in the U.S.

- Power (AC, 1-phase): Specify #2998 for all countries and then select one of the following:

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #2800
	(includes 115V)
220V #2813	127V #2823
230V #2821	
240V #2801	Canada must specify #2800

- Power Cord: If standard 2.8m (9 ft) power cord is not desired, specify: #9511 for 1.8m (6 ft) power cord, #9512 for 3.7m (12 ft) power cord or #9513 for 4.5m (15 ft) power cord.
- (Canada only) Limitations: Only standard 2.8m power cord is available on machines with serial numbers N0000 and later. Prerequisites: #9010 for power cords other than standard 2.8m. Specify: #9010 as a prerequisite with any of the following: #1066, #1120, #3610, #5781, #5782, #8330, #9030, #9511, #9512, #9513, #9520, 9661, or #9890.<)
- Cables: See "Accessories" for cable ordering instructions. See "Installation Manual - Physical Planning", GA27-2787, for cable details. When attached as a console printer, refer to "Installation Manual - Physical Planning", GA22-7004, for S/370 mdl 138/148 and GA24-3667 for 4300 processors, for cable details.
- Machine Nomenclature: Available at time of manufacture only.

Brazilian	#2933	French	#2928
Canadian Fr	#2935	Japanese	#2930
English UK	#2927	Span Speak	#2931
English US	#2924		
- Language: Specify one of the following (see Note 1):

Brazilian	#2775
Canadian French	#2777
EBCDIC	#2751
English UK	#2758
English US	#2756 (Note 2)
International	#2750
Japanese English	#2755
Katakana	#2773 (Note 1, 2)
Spanish Speaking	#2769

Notes:

1. 127-Character, plus space and null, is an enhancement of previously announced 3270 Japanese Katakana. This enhancement may not be compatible on existing 3270 applications for customers using the NL and EM codes. Customers who do not use NL and EM codes can operate in 3270 data stream compatible mode on the 3274 and 3276. When #2773 is specified, the Page Length Control Selector Switch is inoperative.

When Katakana Language #2773 is specified for use on a 308X, the mono/dual mode setting must be in mono mode.

For a 3274 mdl 52C only, specify #2773 or #2756 for Language.

The Language specified must be the same as the transmission code/character set used on the control unit/CPU to which it is attached.

2. Only options for 308X.

- Variable-Width Forms Tractor - Paper Handling (#9185): Specify if (#8700) is ordered and there is a requirement to handle forms with overall width from 76.2 to 203.2mm (3 to 8 inches). Prerequisites: #8700.
- SCS Support (#9660): (Required in an SNA environment/LU Type 1 This is a prerequisite for #8331, although inoperative in a non-LU Type 1 Environment.) Provides the capability to receive SCS (SNA Character String) data stream from the host via a 3274 or a 3276 or a 3601/3602 Finance Communication System Controller or 3694 Document Processing System, or 4701 Finance Communication System Controller, or the 3814 Switching Management System mdl A. This feature allows the 3287 to perform such functions as:
 - Vertical forms skipping to a header or to a vertical tab position
 - Horizontal skipping to a horizontal tab stop position

Page length controls, vertical and horizontal tab positions are host-loaded through the 3274, 3276, 3601/3602/3694, or 4701 via application programming. Included in #9660 are Cancel and Program Attention 1/Program Attention 2 (PA1/PA2) switches. The cancel switch allows operator termination of the current print operation. The PA1/PA2 switch allows an operator to request a specific action from the user written program in the host. Operator settings for page length control, 6 or 8 lines per inch, and Maximum Print Position are set by the host program when the 3287 has #8331 and #9660 and only when user is operating in SCS mode. SCS Mode always operates in Dual Case. Limitations: Cannot be installed with #8330. Maximum: One. Field Installation: Yes. Note: If the 3287 Page Length Control Selector Switches are required for field installation on a machine with serial number below 17000, order no-charge RPQ S30221.

- SCS Support for Structured Field and Attribute Processing (#9661): This is a prerequisite for #5781, although inoperative in a non-LU Type 1 environment. Required for SCS support of:
 - Extended Highlighting (underscore)
 - Programmed Symbols (PS-2 (#5781), PS-4 (#5782))
 - Decompression of PS Load Data
 - Read Partition (Query)
- (Canada only) Limitations: Not available on machines with serial number N0000 and later.<) Maximum: One. Field Installation: Yes. Prerequisites: #3610, #5781.(Canada only> #9010,<) #9660.
- X-Print Error Indication (#9488): To indicate an error, an X is printed on the print line immediately below the last line normally printed. Limitations: Inactive when the 3287 is in SCS mode of operation.
- Character Print Operation:

For 3271/3272 Attachment #8330, specify one of the following:

- #9520 (480-character print operation) for use with a 3271 mdl 1 or 11, or a 3272 mdl 1 or a 3274 mdl 1A, 1B, 1C, 1D, 21B, 21C/BSC, 21D, 31A, 31C, 31D, or 51C, or a 3791 Controller or to the 8101 of the 8100 System when attached via #8330. (Canada only) Limitations: Not available on machines with serial number N0000 and later. Prerequisites: #9010.<)
- #9522 (1,920-character print operation) for use with a 3271 mdl 2 or 12, a 3272 mdl 2, or a 3274 mdl 1A, 1B, 1C, 1D, 21B, 21C/BSC, 21D, 31A, 31C, 31D, or 51C, or a 3791 Controller, or to the 8101 of the 8100 System when attached via #8330, or a S/370 mdl 138/148 Integrated Console Printer Adapter.

(Canada only) Limitations: Not available on machines with serial number N0000 and later. Prerequisites: #9010.<)

For 3274/3276 Attachment #8331, specify one of the following:

- #9521 (960-character print operation) for use with a program which requires a printer buffer size of 960 bytes while using Erase/Write Alternate Command.
- #9522 (1,920-character print operation) for use with a program which requires a printer buffer size of 1,920 bytes while using Erase/Write Alternate Command. Required when attached to a 308X processor, 3814 Switching Management System mdl A or 4300 processor as a console printer.
- #9523 (2,560-character print operation) for use with a program which requires a printer buffer size of 2,560 bytes while using Erase/Write Alternate Command. Prerequisites: #3880.
- #9524 (3,440-character print operation) for use with a program which requires a printer buffer size of 3,440 bytes while using Erase/Write Alternate Command. Prerequisites: #3880.
- #9525 (3,564-character print operation) for use with a program which requires a print buffer size of 3,564 bytes while using Erase/Write Alternate command. Limitations: This specify code is not valid when the 3287 is attached to a 3274 using Configuration Support A #9110. Prerequisites: #3880. Note: To provide compatibility with current application programs on the 3270 Information Display System, the customer can use an Erase/Write command for #9521 to provide 480-character print operation and Specify #9522, #9523, #9524 and #9525 to provide 1,920-character print operation. Copy operation from larger screen display to smaller printer buffer is not acceptable.

3287 PRINTER ATTACHMENT TABLE

14	Yes	Yes	Yes	Yes

Note: 3276 mdls 1, 2 and 3 with SDLC/BSC Switch feature installed and operating in SDLC mode will support all 3287 Character Print Operations, except 3,564-character print operation #9525. Also see Copy restrictions in Note above.

- Blower (#9030): Must be specified for 3287 mdl 1 or 2 to be used in an environment above 32.3 degrees C (90 degrees F) ambient temperature (specification limits up to 40.5 degrees C (104 degrees F)). Field Installation: Yes. (Canada only) Limitations: Not available/required on machines with serial number N0000 and later. Prerequisites: #9010.<)

SPECIAL FEATURES

Summary: (For details see "Special Feature Descriptions")

3287 Printer

3287 Attachments

Notes:

1. Cannot be installed on a 3287 which is attached to an 8775.
2. Cannot be installed on a 3287 which is attached to a 3274 mdl 52C.

Special Feature Descriptions

Data Analysis-APL Feature (#1066): Provides Dual Case US EBCDIC, the APL set and support of TN characters as defined in the Type Catalog, S/370 Printers, under "TN Text Printing". (Canada only) Limitations: Not available on machines with serial number N0000 and later. Cannot be installed with Language Specify Feature, an #8330 to a 3274, or #8331. When #1066 is installed, the Page Length Control Selector Switches are inoperative. Maximum: One. Field Installation: Yes. Prerequisites: (Canada only) #9010; #9522; #1066 on 3271 mdl 2 or 12, or 3272 mdl 2. Customer Setup: No.

Do not reproduce without written permission

APL/TEXT (#1120): Provides the capability for printing the 222-character APL/Text character set including the 94-character EBCDIC set. Limitations: Cannot be installed with #8330, or on the 3287 which is to attach to a 3276 without #1067 or 3274 mdl 1B or 21B, or to a 3274 customized without the APL/Text control functions or when attached to an 8775 or on a 3814 Switching Management System. Not supported when attached to any 308X processor or 4300 processor as a console printer. (Canada only) Limitations: Not available on machines with serial number N0000 and later. Maximum: One. Field Installation: Yes. Prerequisites: #3610(Canada only), #9010, #9082 Customer Setup: No.

Extended Character Set Adapter (#3610): Provides the additional control and buffering necessary for the character and field attributes required for #1120 or #5781, #5782. Provides extended highlighting (underscore) when co-resident with PS-2, PS-4. Limitations: Cannot be installed with #8330 or 3274 mdl 1B or 21B or when attached to an 8775. (Canada only) Limitations: Not available on machines with serial number N0000 and later. Maximum: One. Field Installation: Yes. (Canada only) Prerequisites: #9010. Prerequisites: #1120 or #5781. Customer Setup: No.

Extended Print Buffer (#3880): Provides additional buffer storage which allows 2,560, 3,440 or 3,564-character print operation on the 3287. Limitations: Cannot be installed with #8330, nor with a 3287 which is attached to a 3274 mdl 52C, or when attached to a 3814. Not supported when attached to any 308X processor or 4300 processor as a console printer. Maximum: One. Field Installation: Yes. Customer Setup: No.

Friction-Feed Paper Handling (#4110): For friction feeding of single part non-preprinted continuous and fanfold paper with a minimum width of 203mm (8 inches). Included in this feature is a paper tear bar for tearing continuous forms approximately 51mm (2 inches) above the print line. Feature #4110 is used interchangeable with the Variable-Width Forms Tractor and is attached and removed by the customer. Maximum: One. Field Installation: Yes. Customer Setup: Yes. Note: If forms skipping is required, it is recommended that #8700 be used.

Programmed Symbols-2 (PS-2) (#5781): Provides the storage and accessing of two 190-symbol sets whose shapes and codes are customer-definable. Maximum: One. Limitations: Can only be used with 3274 Category A terminal port with PS Control and Structured Field and Attribute Processing (SFAP) options of Configuration Support C or D. (Canada only) Not available on machines with serial number N0000 and later. Maximum: One. Field Installation: Yes. Prerequisites: #3610, #3880, (Canada only) #9010, <#9661. Customer Setup: No.

Programmed Symbols-4 (PS-4) (#5782): Provides the storage and accessing of four additional 190-symbol sets whose shapes and codes are customer-definable. (Canada only) Limitations: Not available on machines with serial number N0000 and later. Maximum: One. Field Installation: Yes. Prerequisites: (Canada only) #9010, <#5781. Customer Setup: No.

3271/3272 Attachment (#8330): Provides one interface for attachment of a 3287 mdl 1, 2 to a 3271 mdl 1, 2, 11 or 12, a 3272 mdl 1 or 2, or a 3274 mdl 1A, 1B, 1C, 1D, 21B, 21C/BSC, 21D, 31A, 31C, 31D, or 51C, or a 3791 Controller, or an 8101 Storage and Input/Output Unit, or a 3287 mdl 1, 2 to a S/370 mdl 138 or 148 Integrated Console Printer Adapter. Provides the buffer storage required for print operation. Limitations: Cannot be installed with #8331 or with #1066 to a 3274. 127-character plus space and null Katakana Enhancement is not supported. (Canada only) Not available on machines with serial number N0000 and later. Maximum: One. Field Installation: Yes. Prerequisites: (Canada only) #9010. For 3271/3272 -- available port or added #3250 on a 3271 mdl 1, 2, 11 or 12, or 3272 mdl 1 or 2 -- see M3271 or 3272 pages. For 3274 -- An available Type B port -- see M3274 pages. For 3791 Controller -- Device Attachment Type II (#7911/#7912) -- see M3791 pages. For 8101 Storage and Input/Output Unit -- Display and Printer Adapter (#3220) or Display and Printer add'l (#1506) -- see M8101 pages. For S/370 mdl 138 or 148 -- An Integrated Console Printer Adapter -- see M3138 or 3148 pages. Customer Setup: No.

3274/3276 Attachment (#8331): Provides one interface for attachment of a 3287 to a 3274 (all mdls), or to a 3276 mdl 1, 2, 3, 4, 11, 12, 13 or 14, or to an 8775 or to a 3601/3602 Finance Communication Controller, 3694 Document Processing System, 4700 Finance Communication Controller, or to the 3082 Processor Controller, or the 3814 Switching Management System mdl A, or to any 4300 processor. Provides buffer storage required for print operation. Included in this feature is Buffer Reprint support. Limitations: Cannot be installed with #8330 or #1066. Maximum: One. Field Installation: Yes. Prerequisites: (1) #9660, (2) An available port or added #3255, #3256, #3257 on a 3276, or an available Type A port on a 3274, or an available port of a 3082 Processor Controller, or an available port on the 4331 or 4361 Processor Display/Printer Adapter, or Workstation Adapter on the 4362 or an available console position on a 4341 or 4381 Processor, or a Device Cluster Adapter (#3101) on a 3601/3602/3694/4701 or printer attachment (#5580) on an 8775, or Workstation Subsystem Controller on the 9370 Processor. Customer Setup: No.

Variable-Width Forms Tractor (#8700): A forms feeding device for continuous margin punched forms. Overall forms width from 76.2 to 381.0mm (3 to 15 inches) can be fed. Maximum: One. Field Installation: Yes. Prerequisites: #9185 where there is a requirement to handle forms with an overall width from 76.2 to 203.2mm (3 to 8 inches). Customer Setup: Yes. Note: If forms skipping is required, it is recommended that the Variable-Width Forms Tractor (#8700) be used.

MODEL CONVERSIONS

Model 1 to 2 is field installable.

ACCESSORIES

Available on a purchase-only basis. For shipment with machine, order number indicated below.

Forms Stand (#4450, P/N 2526750): Available on a purchase-only basis. For shipment with machine, order #4450. Provides for stacking forms after printing. For forms stacking, use of the Forms Stand is recommended. Customer Setup: Yes. For field installation:

Cables: IBM shielded twisted pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted pair cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and other information, refer to the Systems Supplies operation within your country.

Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787, and "Coaxial Cable and Associated Manual", GA27-2805.

- Assm 2577672 Cable Assembly In-Door
- Bulk 0323921 Coax Wire (Note 1)
- P/N 1836418 Connector Kit (Note 1)
- Assm 1833108 Cable Assembly Out-Door
- Bulk 5252750 Coax Wire (Note 2)
- P/N 1836419 Connector Kit (Note 2)
- P/N 1833104 Station Protector Kit, Carbon (Note 4)
- P/N 2621414 Modification Kit (Note 3)
- P/N 1833106 Station Protector Attachment Kit (Note 5)
- P/N 5252772 Station Protector Element Carbon (Note 6)
- P/N 5252643 Adapter (Note 7)
- P/N 1830818 Station Protection Kit, Gas (Note 4) P/N 5252899 Station Protector Element, Gas (Note 6)

Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.

MACHINES

Notes:

1. Coax wire and one connector kit (includes two connectors P/N 1836446) required for each indoor cable assembly.
2. Coax wire and one connector kit (includes two connectors P/N 1836447) required for each outdoor cable assembly.
3. Customers replacing 2260s may utilize the existing installed cables by use of this modification kit. One kit required for each cable.
4. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.

5. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
6. Replacement station protector elements.
7. Use to join two P/N 2577672 or two P/N 1833108 cable assemblies.

SUPPLIES

Ribbons: A black ribbon, P/N 1136653 or equivalent, is required. Also available is a black ribbon cartridge capability; order RPQ 8Q0199. The replacement ribbon cartridge P/Ns are 7034535 and 7032757.

3287 PRINTER MODELS 1C, 2C

PURPOSE

Provides hard copy output in black or color by using replaceable ribbon cartridges when attached to the 3274, 3276, 4361 Display Printer Adapter or Workstation Adapter and the 8775. Also attaches directly to all models of the 4300 processor, and the 9370 Workstation Subsystem Controller.

MODELS 1C, 2C

Model 1C C01: 80 cps maximum bidirectional printing for a single color on a line

Model 2C C02: 120 cps maximum bidirectional printing for a single color on a line

Note: Actual printer throughput is dependent upon operational and system characteristics. Factors such as controller configuration and line transmission speed, output format, and programming application processing must all be considered in determining actual throughput.

Compared to black or monochrome printing, throughput will be reduced when printing in multi-color as a function of the number of color changes on the page due to a separate pass of the print head for each color on a line. In addition, when printing in other than the standard character format (4 of 7 horizontal x 8 vertical dots) and using the Programmed Symbols (PS) special feature (#5781, #5782, #5783), the machines will print at reduced speeds. Under these conditions, mdl's 2 and 2C will print at the reduced speed of the mdl's 1 and 1C. Dense printing when using the PS feature will also lessen printer throughput. The printer prints in one direction only, right to left, when an all black print line exceeds 120 print positions.

Prerequisites:

- 3274: Available Category A terminal port.
- 3276: Available port or added #3255, #3256, #3257.
- 4331/4361: Available port on the Display/ Printer Adapter or Workstation Adapter on the 4361
- 4341: Available console position on 4341
- 4381: Available console position on 4381
- 8775: Printer Attachment Feature
- 9370: Workstation Subsystem Controller

Customer Setup (CSU): The 3287 is designated as Customer Setup, thereby offering the customer early availability and relocation flexibility. For additional information on CSU, contact IBM.

HIGHLIGHTS

The 3287 consists of control functions, printer and indicator lights in one integrally designed desk-top unit. Special features are available which permit tailoring of the printer to the user's requirements.

Control Functions: Provides the control for all online operations. This unit requires receiving data from a 3274 through a Category A terminal port or a 3276, 4361 Display Printer Adapter or Workstation Adapter or an 8775.

Printer: Maximum printer throughput is obtained with bidirectional serial matrix printing and indexing without unnecessary print head movement. The standard printer dot matrix is 4 of 7 wide by 8 high giving high legibility with character spacing at 10 to the inch. Line spacing is 6 and 8 lines to the inch. With the replaceable black ribbon cartridge, up to 132 print positions can be printed in black on a

line. Using the replaceable multi-color ribbon cartridge, up to 120 print positions can be printed in the colors black, blue, green or red with 121 - 132 print positions printed in black or the whole line printed in black. With the multi-color ribbon, the machine can print in base color. Base color refers to a given color being printed at the field level as a function of the protect, intensify bit positions in the 3270 Data Stream attribute byte. Specifically, the display to printer color mapping is as follows:

3270 Attribute Byte	Color Displ'd	Color Printed
Protected and Intensified	White	Black or Green
Unprotected and Intensified	Red	Red
Protected but not Intensified	Blue	Blue
Neither Protected nor Intensified	Green	Green or Black

The printing of black or green as shown in the table depends upon the Base Color - Black (#9135) or Green (#9136) - specify feature selected.

Extended color printing is the term used for supporting color at the character level in addition to the field level. For any character or field, this additional facility permits the user to select a given color (black, blue, green, red) for printing. The hardware required to support this capability is the Extended Character Set Adapter (#3610) on the printer. Not supported on the 4341 Mdl Group 1, 4341 Mdl Group 2, or on a 8775. The display to printer color mapping for extended color is:

Color Displayed	Color Printed
White	Black
Red	Red
Blue	Blue
Green	Green
Turquoise	Black
Pink	Black
Yellow	Black

Up to 6-part forms with total thickness of 0.457mm (0.018 inches) may be used. For any multi-part or pre-printed continuous forms, the Variable-Width Forms Tractor (#8700) is recommended. 5- and 6-part continuous forms should be tried on an individual basis for acceptable feeding, registration and print quality.

The Friction-Feed Paper Handling (#4110) is recommended for use with non-preprinted single part roll or fanfold paper, with a minimum width of 203mm (8 inches), when the Variable-Width Forms Tractor (#8700) is not used. Maximum overall forms width is 378mm (14-7/8 inches); card stock forms are not recommended. (See GA24-3488 for form specifications and limitations).

Audible Alarm, Mono/Dual Case, Single/Double line spacing, 6 or 8 Lines Per Inch and Maximum Print Position are standard functions. Mono/Dual switch is inoperative when the 3287 is operating in SCS (SNA Character String) data stream mode or when copying from a display or when operating in APL or PS mode. Mono/Dual switch is not supported for Katakana.

Problem Determination Procedure: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem determination and recovery routines and procedures that can be understood and used by the operator. See "Customer Responsibilities" below.

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system and other vendor preparation.
2. Receipt at the customer's receiving dock, unpacking and placement of the 3287.
3. Physical setup, connection of cables, switch settings and checkout.
4. Contact CE to make cable connections of IBM CSU units to IBM non-CSU units where customer access areas are not provided.
5. Notify IBM of intent to relocate and follow IBM instructions for relocation.
6. Use and follow the problem determination procedures and fill out trouble report prior to calling for IBM service.
7. Disconnecting, packing and removing to the customer shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.
8. Providing a desk or table top to support the 3287.

Forms Handling: Variable-Width Forms Tractor (#8700) or Friction-Feed Paper Handling (#4110) must be ordered for each 3287 mdl 1C or 2C. VWFT is recommended for the System Console Printer.

Publications: See "KWIC Index", GA20-1621, or specific system bibliography.

Basic Configuration

SPECIFY

- **Power (AC, 1-phase):** Specify #2998 for all countries and then select one of the following:

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #2800
	(includes 115V)
220V #2813	127V #2823
230V #2821	
240V #2801	Canada must specify #2800

- **Plugs:** The 3-digit country code on the DPMO is used to select a power plug which matches the most commonly used power supply in that country. If an exception to the above is required, a country RPQ may be initiated. For Japan and Canada: Specify #9890 for locking plug or #9891 for nonlocking plug. For details concerning power plugs refer to "IBM 3287 Printer - Planning and Setup Guide", GA18-2018.

Note: If a power supply, not the most common, is specified and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.

Canada will use the same power cords and plugs as used in the U.S.

- **Power Cord:** If standard 2.8m (9 ft) power cord is not desired, specify: #9511 for 1.8m (6 ft) power cord, #9512 for 3.7m (12 ft) power cord or #9513 for 4.5m (15 ft) power cord.
- **Cables:** See "Accessories" for 3287 mdls 1C and 2C cable ordering instructions. See "Installation Manual - Physical Planning", GA27-2787 or GA24-3667, for cable details.
- **Machine Nomenclature:** Available at time of manufacture only.

Brazilian	#2933	French	#2928
Canadian		Japanese	#2930
French	#2935	Spanish	
English UK	#2927	Speaking	#2931
English US	#2924		

- **Language:** Specify one of the following: (see Note 1)

Brazilian	#2775
Canadian French	#2777
EBCDIC	#2751
English UK	#2758
English US	#2756 (Note 3)
International	#2750
Japanese English	#2755
Katakana	#2773 (Note 2)
Spanish Speaking	#2769

Notes:

1. The Language specified must be the same as the transmission code/character set used on the control unit/CPU to which it is attached.
 2. 127-Character, plus space and null, is an enhancement of previously announced 3270 Japanese Katakana. This enhancement may not be compatible on existing 3270 applications for customers using the NL and EM codes. Customers who do not use NL and EM codes can operate in 3270 data stream compatible mode on the 3274 and 3276. When Katakana Language #2773 is specified, the Page Length Control Selector Switch is inoperative. For a 3274 mdl 52C only, specify #2773 or #2756 for Language. The Language specified must be the same as the transmission code/character set used on the control unit/CPU to which it is attached.
 3. Only option for the 3081.
- **Variable-Width Forms Tractor - Paper Handling (#9185):** Specify if #8700 is ordered and there is a requirement to handle forms with an overall width from 76.2mm to 203.2mm (3 to 8 inches). Prerequisites: #8700.
 - **SCS Support (#9660):** SCS Support #9660 must be ordered for all mdl 1Cs and 2Cs: (Required in an SNA environment/LU Type 1, inoperative in a non-LU Type 1 Environment.) Provides the capability to receive SCS (SNA Character String) data stream from the host via a 3274 or a 3276. This feature allows the 3287 to perform such functions as:
 - Vertical forms skipping to a header or to a vertical tab position
 - Horizontal skipping to a horizontal tab stop position
- Page length controls, vertical and horizontal tab positions are host-loaded through the 3274 or 3276 via application programming. Included in #9660 are Cancel and Program Attention 1/Program Attention 2 (PA1/PA2) switches. The cancel switch allows operator termination of the current print operation. The PA1/PA2 switch allows an operator to request a specific action from the user-written program in the host. Operator settings for page length control, 6 or 8 lines per inch, and Maximum Print Position are set by the host program when the 3287 has #9660 and only when user is operating in SCS mode. SCS Mode always operates in Dual Case. Maximum: One. Field Installation: Yes. Limitation: Not supported on a 4300 processor.
- **SCS Support for Structured Field and Attribute Processing (#9661):** This is a prerequisite for #5781, or #5783, although inoperative in a non-LU Type 1 Environment. Required for SCS support of:
 - Extended Color
 - Extended Highlighting (underscore)
 - Programmed Symbols (PS-2 (#5781), PS-4 (#5782), PS-4A (#5783))
 - Decompression of PS Load Data
 - Read Partition (Query)

Maximum: One. Field Installation: Yes. Prerequisites: #3610, #9660.

- X-Print Error Indication (#9488): To indicate an error an X is printed on the print line immediately below the last line normally printed. Limitations: Inactive when the 3287 is in SCS mode of operation.
- Character Print Operation: Specify one of the following:
 - #9521: (960-character print operation) for use with a program which requires a printer buffer size of 960 bytes while using Erase/Write Alternate Command.
 - #9522: (1,920-character print operation) for use with a program which requires a printer buffer size of 1,920 bytes while using Erase/Write Alternate Command. Required when attached to a 4300 processor as a console printer.
 - #9523: (2,560-character print operation) for use with a program which requires a printer buffer size of 2,560 bytes while using Erase/Write Alternate Command. Prerequisites: #3880.
 - #9524: (3,440-character print operation) for use with a program which requires a printer buffer size of 3,440 bytes while using Erase/Write Alternate Command. Prerequisites: #3880.
 - #9525: (3,564-character print operation) for use with a program which requires a print buffer size of 3,564 bytes while using Erase/Write Alternate Command. Prerequisites: #3880. Limitation: This specify code is not valid when the 3287 is attached to a 3274 using Configuration Support A #9110.

Note: To provide compatibility with current application programs on the 3270 Information Display System, the customer can use an Erase/Write command for #9521 to provide 480-character print operation and #9522, #9523, #9524 and #9525 to provide 1,920-character print operation. Copy operation from larger screen display to smaller printer buffer is not acceptable.

3287 PRINTER ATTACHMENT TABLE

3287 Character Print Operation

3276 480/ 1,920/ 1,920/ 1,920/
Mdl 960 1,920 2,560 3,440

1	Yes	No	No	No
11	Yes	Yes	Yes	Yes
2	Yes	Yes	No	No
12	Yes	Yes	Yes	Yes
3	Yes	Yes	Yes	No
13	Yes	Yes	Yes	Yes
4	Yes	Yes	Yes	Yes
14	Yes	Yes	Yes	Yes

Note: 3276 mdls 1, 2 and 3 with SDLC/BSC Switch feature installed and operating in SDLC mode will support all 3287 Character Print Operations, except 3,564 character print operation #9525. (See also Copy restrictions in Note above.)

- Blower (#9030): Must be specified for 3287 mdl 1C or 2C to be used in an environment above 32.3C (90F) ambient temperature (specification limits up to 40.5C (104F)). Field Installation: Yes.
- Base Color - Black #9135: Specified to print in black when the 3279 Display displays in green or the equivalent 3270 attribute byte code is received. The printer will print in green when the 3279s in white or the equivalent 3270 attribute byte code is received. Limitations: Cannot be installed with Base Color - Green (#9136). Applies only when printing in base color. Base color defined in the "Highlights" section.

- Base Color - Green #9136: Specified to print in green when the 3279s in green or the equivalent 3270 attribute byte code is received. The printer will print in black when the 3279 displays in white or the equivalent 3270 attribute byte code is received. Limitations: Cannot be installed with Base Color - Black (#9135). Applies only when printing in base color. Base color defined in the "Highlights" section.

SPECIAL FEATURES

APL/TEXT (#1120): Provides the capability for printing the 222-character APL/Text character set including the 94-character EBCDIC set. Limitations: Cannot be installed on the 3287 which is to attach to a 3276 without APL/Text Control Feature (#1067) or 3274 mdl 1B, or mdl 21B, or mdl 52C, or to a 3274 customized without the APL/Text control function or a 8775. Maximum: One. Field Installation: Yes. Prerequisites: #3610. Customer Setup: No.

Extended Character Set Adapter (#3610): Provides the additional control and buffering necessary for the character and field attributes required for extended color (user-selected color for a given character or field), extended highlighting (underscore), #1120 and #5781, #5782 or #5783 feature. Limitations: Cannot be installed on the 3287 which is to attach to a 3274 mdl 1B, or 21B, or to a 8775. Not supported when attached to any 4300 processor as a console printer. Maximum: One. Field Installation: Yes. Customer Setup: No.

Extended Print Buffer (#3880): Provides additional buffer storage which allows 2,560, 3,440 or 3,564-character print operation on the 3287. Limitations: Not supported when attached to any 4300 processor as a console printer. Maximum: One. Field Installation: Yes. Customer Setup: No.

Friction-Feed Paper Handling (#4110): For friction feeding of single part non-preprinted continuous and fanfold paper with a minimum width of 203mm (8 inches). Included in this feature is a paper tear bar for tearing continuous forms approximately 64mm (2-1/2 inches) above the print line. Feature #4110 is used interchangeable with #8700 and is attached and removed by the customer. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Note: If forms skipping is required, it is recommended that #8700 be used.

Programmed Symbols-2 (PS-2) (#5781): Provides the storage and accessing of two 190-symbol sets whose shapes and codes are customer-definable. Allows printing within a character location in a selected color (black, blue, green or red). Limitations: Can only be used with 3274 Category A terminal port with PS Control and Structured Field and Attribute Processing (SFAP) option of Configuration Support C or D. Cannot be installed with #5783. Maximum: One. Field Installation: Yes. Customer Setup: No. Prerequisites: #3610, #3880, and #9661.

Programmed Symbols-4 (PS-4) (#5782): Provides the storage and accessing of four additional 190-symbol sets whose shapes and codes are customer-definable. Allows printing within a character location in a selected color (black, blue, green or red). Limitations: Cannot be installed with #5783. Maximum: One. Field Installation: Yes. Prerequisites: #5781. Customer Setup: No.

Programmed Symbols-4A (PS-4A) (#5783): Provides the storage and accessing of four 190-symbol sets whose shapes and codes are customer-definable. Three of the symbol sets allow printing within a character location in a selected color (black, blue, green or red) and the remaining set allows printing up to four colors (black, blue, green and red) within a given character location. Recommended for presentation graphics, reference 3270 Information Display System Color and Programmed Symbols, GA33-3056. Limitations: Can only be used with 3274 Category A terminal port with PS Control and SFAP options of Configuration Support C or D. Cannot be installed with #5781 or #5782. Maximum: One. Field Installation: Yes. Prerequisites: #3610, #3880, and #9661. Customer Setup: No.

Variable-Width Forms Tractor (#8700): A forms feeding device for continuous margin-punched forms. Overall forms width from 76.2 to

MACHINES

381.0mm (3 to 15 inches) can be fed. Maximum: One. Field Installation: Yes. Prerequisite: #9185 where there is a requirement to handle forms with an overall width from 76.2 to 203.2mm (3 to 8 inches). Customer Setup: Yes.

MODEL CONVERSIONS

Model 1C to 2C is field installable. Model changes from models 1 and 2 to models 1C and 2C are not recommended for field installation.

ACCESSORIES

Available on a purchase-only basis. For shipment with machine, order number indicated below.

Forms Stand (#4450, P/N 8678375): Available on a purchase-only basis. For shipment with machine, order #4450. Provides for stacking forms after printing. For forms stacking, use of the Forms Stand is recommended. Customer Setup: Yes. For field installation:

Cables: IBM shielded twisted pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted pair cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and information, refer to the Systems Supplies operation with your country.

Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787 and "Coaxial Cable and Associated Manual", GA27-2805.

- Assm 2577672 Cable Assembly In-Door
- Bulk 0323921 Coax Wire (Note 1)
- P/N 1836418 Connector Kit (Note 1)
- Assm 1833108 Cable Assembly Out-Door
- Bulk 5252750 Coax Wire (Note 2)
- P/N 1836419 Connector Kit (Note 2)
- P/N 1833104 Station Protector Kit, Carbon (Note 4)
- P/N 2621414 Modification Kit (Note 3)
- P/N 1833106 Station Protector Attachment Kit (Note 5)
- P/N 5252772 Station Protector Element Carbon (Note 6)
- P/N 5252643 Adapter (Note 7)
- P/N 1830818 Station Protection Kit, Gas (Note 4)
- P/N 5252899 Station Protector Element, Gas (Note 6)

Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.

Notes:

1. Coax wire and one connector kit (includes two connectors P/N 1836446) required for each indoor cable assembly.
2. Coax wire and one connector kit (includes two connectors P/N 1836447) required for each outdoor cable assembly.
3. Customers replacing 2260s may utilize the existing installed cables by use of this modification kit. One kit required for each cable.
4. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
5. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
6. Replacement station protector elements.
7. Use to join two P/N 2577672 or two P/N 1833108 cable assemblies.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 7032482 or equivalent is required for printing only black. A multi-colored ribbon cartridge, P/N 7032483 or equivalent, is required for color printing.

3287 PRINTER MODELS 11, 12

PURPOSE

Provides hard copy output for the 8100 Information System or a 4331 Processor via Loop Attachment.

MODELS 11, 12

Model 11 011: 80 cps maximum bidirectional print.

Model 12 012: 120 cps maximum bidirectional print.

Note: Actual printer throughput is dependent upon operational and system characteristics. Factors such as controller configuration and line transmission speed, output format, and programming application processing must all be considered in determining actual throughput.

Prerequisites: For direct attached Loop operation - #4830 or #4835 on the 8100 System, - #4830 or #4831 on the 4331 Processor. For data link attached Loop operation - #3842 or #3843 Loop Control Unit.

Customer Setup (CSU): The 3287 is designated as Customer Setup, thereby offering the customer early availability and relocation flexibility. For additional information on CSU, contact IBM.

HIGHLIGHTS

The 3287 mdls 11-12 consist of LOOP communication functions, printer and indicator lights in one integrally designed desk-top unit. EBCDIC Dual Case Operation, Audible Alarm and Cancel Print are provided as standard functions. Variable-Width Forms Tractor and Friction-Feed Paper Handling are available as special features.

The printer operates in SCS mode, which provides for customer program-definable horizontal and vertical formatting, including line density (3, 4, 6 or 8 lines per inch).

Operator capability to set the page length, page depth and the line density from the operator panel is available via RPQ 8Q0070. To order an RPQ, contact IBM.

Printer: Maximum printer throughput is obtained with bidirectional serial matrix printing and indexing without unnecessary print head movement. The printer dot matrix is 4 of 7 wide by 8 high giving high legibility with character spacing at 10 to the inch. Line spacing is 3, 4, 6 or 8 lines to the inch. Up to 132 characters can be printed in a line. Up to 6-part forms with total thickness of 0.457mm (0.018 inches) may be used. For any multi-part or preprinted continuous forms, #8700 is recommended. 5- and 6-part continuous forms should be tried on an individual basis for acceptable feeding, registration and print quality. Maximum width is 381mm (15 inches); card stock forms are not recommended. (See GA24-3488 for forms specifications and limitations.)

#4110 is recommended for use with non-preprinted single part roll or fanfold paper, with a minimum width of 203mm (8 inches), when #8700 is not used. Maximum overall forms width is 378mm (14-7/8 inches); card stock forms are not recommended. (See GA24-3488 for forms specifications and limitations.)

Problem Determination Procedure: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem determination and recovery routines and procedures that can be understood and used by the operator. See "Customer Responsibilities" below.

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system and other vendor preparation.

2. Receipt at the customer's receiving dock, unpacking and placement of the 3287.
3. Physical setup, connection of cables, switch settings and checkout.
4. Notify IBM of intent to relocate and follow IBM instructions for relocation.
5. Use and follow the problem determination procedures and fill out trouble report prior to calling for IBM service.
6. Disconnecting, packing and removing to the customer shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.
7. Providing a desk or table top to support the 3287.
8. Procurement, installation and maintenance of the loop network.

Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided as standard for attachment to a direct attached or data link attached loop. Standard cable is 3.7ms (12 ft) in length.

Forms Handling: #8700 or #4110 must be ordered for each 3287 mdl 11 or 12.

Publications: See "KWIC Index", GA20-1621, or specific system bibliography.

SPECIFY

- Power (AC, 1-phase): Specify #2998 for all countries and then select one of the following:

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #2800
	(includes 115V)
220V #2813	127V #2823
230V #2821	
240V #2801	Canada must specify #2800

- Plugs: The 3-digit Country Code on the DPMO is used to select a power plug which matches the most commonly used power supply in that country. If an exception to the above is required, a country RPQ may be initiated. For Japan and Canada: Specify #9890 for locking plug or #9891 for nonlocking plug. For details concerning power plugs refer to "IBM 3287 Printer - Planning and Setup Guide", GA18-2018.

Note: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the country RPQ referenced above is initiated.

Canada will use the same power cords and plugs as used in the U.S.

- Power Cord: If standard 2.8m (9 ft) power cord is not desired, specify: #9511 for 1.8m (6 ft) power cord, #9512 for 3.7m (12 ft) power cord or #9513 for 4.5m (15 ft) power cord.
- Carrier Rate: One of the following must be specified: #9825 for up to 9600 bps -- #9829 for up to 38,400 bps.
- Machine Nomenclature: Available at time of manufacture only.

Brazilian #2933 French #2928
Canadian

French #2935 Japanese #2930
English UK #2927 Spanish
English US #2924 Speaking #2931

- Language: Specify one of the following: (Note 1)

Brazilian	#2775
Canadian French	#2777
EBCDIC	#2751
English UK	#2758
English US	#2756
French	#2770
International	#2750
Japanese English	#2755
Katakana	#2773
Portuguese	#2749
Portuguese (A)	#2741 (Note 2)
Spanish Speaking	#2769

Notes:

1. The Language specified must be the same as the transmission code/character set used on the control unit to which it is attached.
 2. Alternate character set (A) is provided for Portuguese to ensure compatibility with the existing 3271/3272 data files.
- Variable-Width Forms Tractor Paper Handling #9185: Specify if #8700 is ordered and there is a requirement to handle forms with an overall width from 76.2 to 203.2mm (3 to 8 inches). Prerequisites: #8700.
 - Blower (#9030): Must be specified for 3287 mdl 11 or 12 to be used in an environment above 32.3 degrees C (90 degrees F) ambient temperature (specification limits up to 40.5 degrees C (104 degrees F)). Field Installation: Yes.
 - Direct-Attach or Data Link-Attach: Identify Direct-Attach or Data Link-Attach by specifying one of the following:
 - Direct-Attached Loop Operation #9607
 - Data Link-Attached Loop Operation #9608
 - Hyphenation of Control Characters: To permit hyphenation of control characters upon receipt of individual control codes, specify #9424.

SPECIAL FEATURES

One of the following two must be ordered, or both features may be ordered:

Friction-Feed Paper Handling (#4110): For friction feeding of a single part non-preprinted continuous and fanfold paper with a minimum width of 203mm (8 inches). Included in this feature is a paper tear bar for tearing continuous forms approximately 51mm (2 inches) above the print line. Feature #4110 is used interchangeably with the Variable-Width Forms Tractor and is attached and removed by the customer. Maximum: One. Field Installation: Yes. Customer Setup: Yes. Note: For applications that require forms skipping, #8700 is recommended.

Variable-Width Forms Tractor (#8700): A forms feeding device for continuous margin punched forms. Overall forms width from 76.2 to 381.0mm (3 to 15 inches) can be fed. Maximum: One. Field Installation: Yes. Prerequisite: #9185 where there is a requirement to handle forms with an overall width from 76.2 to 203.2mm (3 to 8 inches). Customer Setup: Yes.

MODEL CONVERSIONS

Model 11 to 12 is field installable. Changes from models 1 and 2 to models 11 and 12 are not recommended for field installation.

ACCESSORIES

Available on a purchase-only basis. For shipment with machine, order number indicated below.

Forms Stand (#4450, P/N 8678375): Available on a purchase-only basis. For shipment with machine, order #4450. Provides for stacking forms after printing. For forms stacking, use of the Forms Stand is recommended. Customer Setup: Yes. For field installation:

SUPPLIES

Ribbons: P/N 1136653, or equivalent, is required. Also available is a black ribbon cartridge capability, order RPQ 8Q0199. The replacement ribbon cartridge P/Ns are 7034535 and 7032757.

3290 INFORMATION PANEL DISPLAY STATION

PURPOSE

A high-function, large capacity, plasma-panel display station that attaches to a 3274 Control Unit. A member of the 3270 Display System family, the 3290 provides for the display of up to 9,920 alphanumeric characters in multiple-screen format options for use in entering data into and retrieving data from S/370 Processors, 4300 Processors, 9370 Processors and 8100 Information Systems.

MODEL

Model 1 001: (WITHDRAWN FROM MARKETING and replaced with mdl 220 and 230. Cannot be ordered after December 6, 1985.)

Model 220: A slim profile display station that displays up to 9,920 characters and provides a Data/Typewriter keyboard. (Similar to the 3290 mdl 1 keyboard.)

Model 230: A slim profile display station that displays up to 9,920 characters and provides a Data/Typewriter keyboard with an integrated numeric keypad. (Similar to the 3179, 3180 keyboards.)

Model T30: A slim profile display station meeting TEMPEST specification NACSIM 5100A that displays up to 9,920 characters and provides a Data/Typewriter keyboard with an integrated numeric keypad. (Similar to the Mdl 230 keyboard but which is not customer modifiable and is available in English only.) Note: The second character of the AAS model number specifies which keyboard will be supplied. The number 2 specifies a standard keyboard and the number 3 specifies a keyboard with an integrated numeric keypad.

Note: Not applicable to Mdl T30 which is 100V, English only. Language option and voltage selection will be designated by the third character of the WT AAS model number:

Y	English US	100V
D	Canadian French	100V
F	Canadian English	100V
K	Japanese Katakana	100V
M	Japanese Katakana	200V
B	Japanese English	100V
C	Japanese English	200V
S	Spanish Speaking	100V
T	Spanish Speaking	200V

Prerequisites:

1. A 3274 model 31A, 31C, 31D, 41A, 41C, 41D, 51C, or 61C with configuration support D at release level 64 or higher. (#9124 must be ordered against the 3274 for mdls 31X, 51C and 61C.)
2. Specify 3274 Load Diskette #9301 (except Katakana) or #9305 (Katakana, mdls 220 and 230 only). Note: Since this feature code diskette is used to support the 3290 mdl 001, 3290 mdl 220/230/T30, and 3179 mdl G, customers should read the diskette label to verify that the 3290 code is at Level D41.00 or higher which supports both models 1 and 220/230/T30. These feature codes must be ordered against the 3274, NOT the 3290.
3. A 3178, 3179, 3278 or 3279 Display Station with a keyboard must be attached to Port 0 of the control unit as a diagnostic unit.

HIGHLIGHTS

The 3290 Information Panel Display Station provides a high level of visual display function for the IBM 3270 user. A member of the 3270 family, the 3290 incorporates a flat plasma panel as its display medium to provide a large capacity display for alphanumeric data and graphic images. The image displayed is orange on a black background and is uniform at every point of the viewing area. The 3290

uses microcode loaded from the 3274 Control Unit, to provide screen management facilities for improved operator usability. The 3290 is data-stream compatible with all models of today's 3270 displays in alphanumeric application environments and complements the 3270 product family by extending 3270 capability to include large screen and multiple screen application usage. Its flat panel allows compact packaging and provides a versatile display station.

- Large flat panel viewing area in small footprint package
 - Displays up to 9,920 characters -- 62 lines of 160 characters each. Characters are displayed within a 5x8 character matrix.
 - Alternate display of up to 5,300 characters -- 50 lines of 106 characters each. Larger characters displayed within a 7x9 character matrix.
 - Variable character spacing.
 - Multiple partitions (up to 16).
- Advanced Screen Management Facilities
- Multiple display capability
- Vertical scrolling in Native Mode
- 24K Character buffer
- Ruling, Row/Column Indicator, Zoom Operator Controls
- Intensify Options, i.e., Reverse Video, Underline or No Highlight
- Entry Assist Note: Entry assist is not supported with the Katakana Language.
- Two keyboards, one with an integrated keypad, with customer-modifiable layouts. (One keyboard with an integrated keypad and NOT customer modifiable for mdl T30.) Note: Customer modifiable keyboards are not supported with the Katakana language.
- Screen tilt
- String and Block copy of data Note: String and block copy is not supported with the Katakana language.
- Local copy
- Alert
- Ability to print 160 columns of data
- 3278 function
- Audible alarm
- Security keylock
- Programmed Symbols (six character sets)
- APL (see "Keyboard Accessory Keycap Kits")
- Response Time Monitor Note: RTM historical data stored in the 3274 Control unit cannot be viewed with a 3290 Information Panel but can be viewed by other authorized terminals attached to the Control unit.

The 3290 Information Panel attaches to a 3274 Control unit utilizing one physical port and up to five addresses, depending on the application. Up to 31 3290's can be attached to a 3274 depending on the application and 3274 model being used. The 3290 Information Panel attaches with the same coax cable that is used with other Category A terminals to attach to a 3274 Control Unit. Note: The 3290 mdl T30 requires a triax to coax adapter which must be supplied by the customer.

Customer Setup (CSU): The 3290 is designated as a customer setup machine. Setup instructions are included with each machine. (See manual GA23-0243 for mdls 220/230 or G23-0303 for mdl T30.)

IBM setup is available at IBM hourly rates and minimum charge.

SPECIFY

Customer Responsibilities: The customer is responsible for:

- Adequate site, system and other vendor preparation.
- Receipt at customer's receiving dock, unpacking and placement of unit.
- Physical setup, connection of cables in customer access areas, switch settings and checkout.
- Performing customer problem determination.
- Removing customer-owned keycaps if a keyboard is replaced by an IBM Customer Engineer while performing on-site repair. (See "Keyboard Accessories".)
- Notify IBM of intent to relocate and follow IBM instructions for relocation.
- Assuring that for the 3290 mdl T30, the coaxial cable attachment and triax to coax adapter to the 3274 control unit also satisfies the electromagnetic data security requirements of Federal Specification NACSIM 5203. The adapter must be supplied by the customer.

Warranty Service: IBM On-Site Repair warranty service is provided under the Agreement For Purchase of IBM Machines and is available 24 hours a day, 7 days a week.

Maintenance Service: IBM On-Site Repair Maintenance Service is available under the IBM Maintenance Agreement at the applicable Minimum Maintenance Charge. The base period of Maintenance Service availability is 7 AM to 6 PM, Monday through Friday. Optional periods of Maintenance Service are available for additional charges.

To obtain this service a customer calls the IBM Service/Exchange Communication Center on the National Toll-free Number (800)428-2569. Once customer problem determination is completed, an IBM Customer Engineer will be dispatched to repair the failing unit.

There is no regularly scheduled preventive maintenance recommended by IBM on these units.

If an IBM maintenance agreement is not contracted for immediately following expiration of the service and parts warranty, and the customer subsequently wants maintenance coverage, the customer must have an IBM customer engineer inspect the machine. A minimum charge for the inspection, cleaning, and testing will be applied. In addition, all time and parts required to qualify the machine for maintenance agreement acceptability will be billed at IBM's then current rates and terms. The machine will then qualify for IBM maintenance agreement coverage.

If, on the basis of the inspection, IBM concludes that the machine is not repairable, no further work will be performed and a minimum charge will be applied.

- "IBM 3290 Information Panel Operators Guide" GA23-0242
- "IBM 3290 Information Panel Set Up Instructions (Mdl 220/230)" GA23-0243
- "IBM 3290 Information Panel Problem Determination Guide (Mdl 220/230)" GA23-0244
- "IBM 3290 T Information Panel Installation and Problem Determination Guide (Mdl T30)" GA23-0303
- "IBM 3290 Information Panel Maintenance Information Manual" GA23-0245 (All above shipped with the product.)
- See "Kwic Index", G320-1621, or specific system bibliography.

Specify codes are not required when ordering a 3290 mdl 220/230/T30. See descriptions of mdls 220, 230, or T30 in "Models" section of sales pages.

Note: All orders require specify #2998 for records purpose; mdl T30 available 100V, English only.

The 3 digit WT Country Code entered on DPMO will be used to select (default) the WT Country variables (power, power cable and keyboard/language) based on the specification most commonly used in that country. If the specify is not desired or if the default is not listed for your country, specify the appropriate code number from the lists below. **Note:** Mdl T30 available with 100V power and English language only.

If not specified otherwise, the 3290 will be shipped with the following:

- Power: #2804 for 100-127V, AC 1-phase, 3-wire, 50-60 Hz, Canada, Japan, Venezuela, Colombia, Mexico. #2806 for 200-240V, AC 1-phase, 3-wire, 50-60 Hz, Argentina and Australia.
 - Power line cord: 2.8m (9 ft), mdls 220 and 230 with the most commonly used plug for each country will be shipped with each machine. Refer to "IBM 3270 Information Display System Installation - Physical Planning Manual", (GA27-2787), for further information. For Canada and Japan, standard nonlocking plugs will be supplied. (For mdl T30 a 1.8m (6 ft) filtered cord with nonlocking plug will be shipped.)
 - Keyboard Language: The keyboard language will be designated by the third character of the model number. Refer to "Models" section of the sales pages for further information. Mdl T30 available English only.
 - Keyboard Types: The second character of the AAS model number specifies which keyboard will be supplied. Number 2 specifies a standard keyboard and number 3 specifies a keyboard with an attached numeric keypad.
 - Data/Typewriter Keyboard (mdl 220): The 3290 mdl 220 has a low-profile, customer-modifiable, EBCDIC typewriter-like keyboard with adjustable keyboard slope and coiled cable. There are 24 Program Function keys located in two rows across the top of the keyboard. Overlays are provided to permit users to identify functions assigned to these keys. Refer to the Type Catalog section for a pictorial view of the keyboard layout. Corequisite: None. Maximum: One keyboard can be attached at a time. Field Installation: Yes. (CSU) See "Field Keyboard Change" for descriptions.
 - Data/Typewriter Keyboard with Integrated Numeric Pad (mdl 230): The same keyboard as the Data/Typewriter keyboard described above but with 18 additional keys located to the right side of the keyboard in a calculator-like layout. Refer to the Type Catalog section for a pictorial view of the keyboard layout. Corequisite: None. Maximum: One keyboard can be attached at a time. Field Installation: Yes. (CSU) See "Field Keyboard Change" for descriptions.
 - Data/Typewriter Keyboard with integrated Numeric Keypad (mdl T30): The same keyboard layout as the mdl 230 keyboard described above but which is not customer modifiable. Field Installation: Yes. (CSU) See "Field Keyboard Change" for descriptions.
 - Mdl 220/230 Keyboards are Customer Modifiable: The keyboard layouts may be changed by using the 3290 mdl 220/230/T30 utility diskettes supplied with the 3274 Control Unit. Keyboards may be modified using the keyboard labels and new keycap kits. See "Keyboard Accessories" for kit descriptions.
- The keyboard modification function is explained in the "IBM 3290 Description and Reference Manual", GA23-0021.
- Japanese Katakana keyboards cannot be modified with the 3290 mdl 220/230/T30 utility diskette.

- Field Keyboard Change: If a new keyboard is required by a customer after the equipment is delivered, it may purchased

and ordered: by Parts and supplies requisition using part numbers listed below.

Keyboard Language	PART NUMBER		
	Keyboard w/Keypad (mdl 230)	Standard Keyboard (mdl 220)	Keyboard w/Keypad (mdl T30)

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associate accessories.

Twisted pair cable - For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information refer to the Systems Supplies operation with your country.

Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", (GA27-2787) and "Coaxial Cable and Associated Manual", (GA27-2805).

The 3290 mdl T30 is provided with a six foot triax (RG22) communications cable. A correct adapter for attaching the triax to coaxial cable must be provided. Contact your IBM Marketing Representative for further details.

Security Keys: The 3290 is shipped with two keys for the keylock. Additional keys may be purchased from IBM. Key identification number must accompany each order. Key identification number can be found on the keylock. Supply both the key code and part number from the chart below for each key order.

Key Code	P/N	Key Code	P/N
P201	6423005	P206	6423010
P202	6423006	P207	6423011
P203	6423007	P208	6423012
P204	6423008	P209	6423013
P205	6423009	P210	6423014

Order additional keys on a PSR from your plant of manufacture.

Note: A letter of authorization with key identification numbers must accompany each order. Allow six to eight weeks for delivery. If the key identification number is unknown, the key lock assembly may be exchanged by your IBM customer engineer and billed on an hourly service basis.

Keyboard Accessories: Various keyboard accessories can be ordered as noted below but cannot be ordered or supplied with the initial factory order.

The following keyboard accessories can be ordered:

- Blank keycaps light color (P/N 1351710): 60 keycaps and removal tool.
- Blank keycaps dark color (P/N 1351728): 60 keycaps and removal tool.
- Clear lens keycaps for Write-on-Paper Insets (P/N 6341707): 60 caps with paper insets, 60 dark and 60 light, and removal tool.
- Paper insets for clear lens keycaps (P/N 6341704): 150 light and 150 dark.
- Keycap removal tool (P/N 1351717): 6 tools.
- APL keycap kit (P/N 1351711): English US (1 set and removal tool).
- Data Entry keycap kit, English US (P/N 1351741): 1 set and removal tool.
- PF keycap kit/87-key typewriter-like, English US (P/N 1351742): 2 sets and removal tool.
- PF keycap kit (P/N 1351736): PF1-PF24 blank on front (1 set and removal tool)
- Numeric keycap kit (P/N 1351738): 0 thru 9 plus Backspace, Front Tab, Back Tab, Space, Period, Comma, and Minus on top of keycaps. Front blank. Also 5 light and 8 dark colored blank keytops. (1 set and removal tool)
- Lower case \$ for JES2 etc (P/N 1351734): (SYS \$ on top of keycap, front blank) (SYS \$ on top of keycap, Erlnp on front face) (7 sets and removal tool)
- APL keycap kit, Canadian French (P/N 1351726): 1 set and removal tool.
- APL keycap kit, Japanese Katakana (P/N 1351718): 1 set and removal tool.
- APL keycap kit, Spanish Speaking (P/N 1351727): 1 set and removal tool.

SUPPLIES (NONE)

3299 TERMINAL MULTIPLEXER MODEL 1

(NO LONGER AVAILABLE)

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

A terminal multiplexer unit which can be used when connecting Category A Terminals to a 3274, or to the Workstation Adapter on the 4361 except for the 3274 mdl 51C. Using a 3299 reduces the cable requirements which provides for lower subsystem cabling costs and improved cabling flexibility. Also, the distance that a terminal may be located away from its 3274 is increased up to a maximum of 1,210m (4,000 ft) using shielded twisted-pair cable or 3,000m (9,840 ft) using coaxial cable. Each 3299 Terminal Multiplexer attaches up to eight Category A Terminals; therefore, four 3299s are required when attaching 32 terminals to a 3274 or to the Workstation Adapter on the 4361.

MODEL 1

Model 1 001: Used with the 3299 Terminal Multiplexer Support specify option #9901 on 3274 mdls 41A, 41C, 41D and 61C or with 3299 Terminal Multiplexer Support RPQs 8K1155 and 8K1156 on a 3274 mdl 1A, 1B, 1C, 1D, 21A, 21B, 21C, 21D, 31A, 31C or 31D.

Prerequisites:

1. #9901 Multiplexer Support on a 3274 mdl 41A, 41C, 41D or 61C. RPQ 8K1155 and/or 8K1156 on a 3274 mdl 1A, 1B, 1C, 1D, 21A, 21B, 21C, 21D, 31A, 31C, or 31D.
2. One 3299 is required for each group of eight Category A Terminals to be attached to a 3274.

Customer Setup (CSU): The 3299 is designated a customer setup unit. Setup instructions are included with each unit.

HIGHLIGHTS

Using a 3299 Terminal Multiplexer eliminates the requirement for individual cables from a 3274 to each attached terminal. Only one cable is required between the 3274, or the Workstation Adapter on the 4361 and a 3299 which can be located up to 610m (2,000 ft) using shielded twisted pair or up to 1,500m (4,920 ft) using coaxial cable from a 3274, or the Workstation Adapter on the 4361. The 3299 can then attach up to eight Category A Terminals, each with its own cable. Each of these cables between the 3299 and a terminal can also be up to 610m (2,000 ft) using shielded twisted pair or 1,500m (4,920 ft) using coaxial cable. This permits terminals to be located up to a maximum of 1,210m (4,000 ft) using shielded twisted pair cable or 3,000m (9,840 ft) using coaxial cable from a 3274, or the Workstation Adapter on the 4361 or double the distance that is allowed when a terminal is attached directly to a 3274, or the Workstation Adapter on the 4361.

Customer Responsibilities: The customer is responsible for:

- Adequate site preparation.
- Receipt at customer's receiving dock, unpacking and placement of unit.
- Setup of unit and connection of cables.
- Performing customer problem analysis and resolution (CPAR).
- Isolating a defective unit, replacement of unit, and delivering the defective unit with failure analysis report to an IBM Service/Exchange Center for exchange.
- Determination of the required number of spares.

Spares: It is recommended that the customer replace a failing 3299 unit with a spare unit and that the customer be advised to purchase sufficient spare 3299 units for such use. The number of spare units recommended is dependent upon the number of 3299 units the customer has installed, the application requirements, and the physical locations. Determination of the required number of spares is a customer responsibility, however, the minimum number of spare units recommended is shown in the table below:

Recommended Minimum Number of Spare 3299s:

Number of 3299s Installed	Spare 3299s
1 - 100	1
101 - 200	2
201 - 600	3
601 - 1,000	5

The customer should be advised to test spares for correct operation before storing them.

Publications: "3299 Terminal Multiplexer, Product Information Manual", (G520-4216).

Basic Configuration: Specify codes (except for Mandatory Specify #2998) are not normally required to order a 3299. The 3-digit Country Code entered on the DP machine order will be used to select (default) the Country variables (power cable, plug, etc.) based on the specification most commonly used in that country. If not specified otherwise, the 3299 will be shipped with the following:

- Power (AC, 1-phase, 50/60 Hz): One power supply satisfies all power requirements. The power supply operates, without any modifications or adjustments, at any voltage in the range of 100 to 240V at either 50 or 60 Hz.
- Power Cable: Each 3299 unit will be shipped with a 1.8m (6 ft) line cord and plug. The plug is determined by the country code.
- In countries where both 100 to 127 and 200 to 240V ranges are applicable a specify code must be used when a 200 to 240V power cable and plug is required (see below).
 - Only 100 to 127V power cable and plugs are available in these countries: Canada, Guyana, and Mexico.
 - Only 200 to 240V power cable and plugs are available in these countries: Afghanistan, Antigua, Argentina, Australia, Bangladesh, Brunei, Burma, Chile, Hong Kong, India, Malaysia, Nepal, New Zealand, Papua New Guinea, Paraguay, Peru, Singapore, Sri Lanka, Thailand, and Uruguay.
 - Both 100 to 127 and 200 to 240V power plugs are available. For these countries, a 100 to 127V power plug is provided (default) unless specify code #0500 is specified (see "Specify").
 - All other countries.

SPECIFY

- Mandatory Specify #2998 - AG-A/PG order.
- 200 to 240V Power Plug: For these countries where both 100 to 127 and 200 to 240V ranges are used (see "Basic Configuration"), a 100 to 127V power cable and plug is provided (default) with the basic configuration. If a 200 to 240V power source is to be used, specify code #0500 must be specified to get a 200-240V power plug in lieu of the 100 to 127V power cable and plug normally provided.

MACHINES**SPECIAL FEATURES (NONE)****MODEL CONVERSIONS (NONE)****ACCESSORIES**

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted-pair cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System-Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation with your country.

Coaxial cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual-Physical Planning", GA27-2787, and "Coaxial Cable and Associated Manual", GA27-2805.

IBM 3270 DPC-T3 Adapter (P/N 83X9758): A cable adapter assembly that permits direct attachment to telephone twisted pair wire, that meets the IBM Cabling System Type 3 specifications, up to a maximum distance of 275m (900 ft.). It is 4.6m (15 ft.) in length with an IBM Dual Purpose Connector (DPC) at one end and a miniature six-pin modular telephone connector on the other end. The telephone connector can be cut off, and the wire inserted directly into telephone punch-down blocks that are capable of accepting stranded telephone wire. The accessory can also be used at the terminal end of the wire provided the terminal has an IBM Dual Purpose Connector (DPC). (Canada only) Otherwise, a CTPA is required. The IBM 3270 DPC-T3 Adapter is not required on the ends of telephone wires that attach to the terminal connectors of a 3299 Model 3. <)

Ordering: Order via NDD DRO or via Distributors authorized to market the IBM Cabling System components. Minimum order quantity is one package which contains ten IBM 3270 DPC-T3 Adapter assemblies.

SUPPLIES (NONE)

3299 TERMINAL MULTIPLEXER MODEL 2

PURPOSE

A 3299 Terminal Multiplexer Model 2 can be used to connect terminals to a 3174 Subsystem Control Unit, a 3274 Control Unit (except for the model 51C), a 4361 Workstation Adapter (WSA), or a 4702 Branch Automation Processor. Using a 3299 provides for lower subsystem cabling costs by reducing the cable requirements, gives improved cabling flexibility, and/or can extend the distances that terminals can be located away from a control unit. (Except Canada> A 3299 can be used with coaxial cable or the IBM Cabling System.<) (Canada only> A 3299 can be used with coaxial cable or the IBM Cabling System or with specified telephone twisted-pair (TTP).<) The maximum distance that a terminal can be located away from its control unit is 3,000m (9,840 ft) when using coaxial cable, up to 2,500m (8,200 ft) when using IBM Cabling System with a 3174 or 4702, up to 2,000m (6,560 ft) when using IBM Cabling System with a 3274 or (Except Canada> 4361.<) (Canada only> 4361 and up to 550m (1,800 ft) with specified telephone twisted-pair.<) Each 3299 can attach up to eight terminals, therefore, four 3299s are required when attaching 32 terminals to a control unit. An accessory is available for mounting 3299s in an equipment rack.

MODEL 2 (CANADA ONLY> AND 3<)

Model 2 002: (Except Canada> Only the model 2 is available.<) It is used to connect terminals to 3174 Subsystem Control Units, 3274 Control Units (except the Model 51C), 4361 Workstation Adapters (WSA), and 4702 Branch Automation Processors. It is used with coaxial cable or the (Except Canada> IBM Cabling System.<) (Canada only> IBM Cabling System or with specified telephone twisted-pair using Coax-to-Twisted-Pair adapters (CTPA).<)

(Canada only> **Model 3 003:** Used to connect terminals to 3174 Subsystem Control Units, 3274 Control Units (except the Model 51C), 4361 Workstation Adapters, and 4702 Branch Automation Processors using specified telephone twisted-pair (TTP) between the 3299 and the terminals. Using the 3299 Model 3 eliminates the need for Coax-to-Twisted-Pair adapters (CTPA) on the TTP cable ends connecting to the 3299.<)

Prerequisites:

- #9901 Multiplexer Support (or RPQ 8K1180, 8K1181, 8K1182 or 8K1183) on a 3274 model 41A, 41C, 41D or 61C.
- RPQ 8K1155, 8K1156 and/or 8K1194 on a 3274 model 1A, 1B, 1C, 1D, 21A, 21B, 21C, 21D, 31A, 31C, or 31D.
- No prerequisites are required on the 4361 WSA or the 3174 Subsystem Control Unit.
- One 3299 is required for each group of eight Category A Terminals to be attached.
- #3102 or #9638 Device Cluster Adapter on a 4702 Branch Automation Processor.

Customer Setup (CSU): The 3299 is designated as a customer setup unit. Setup instructions are included with each unit.

HIGHLIGHTS

Using a 3299 Terminal Multiplexer eliminates the requirement for individual cables from a Control Unit to each attached terminal. Only one cable is required between the control unit and a 3299. The 3299 can then attach up to eight Category A Terminals each with its own cable.

When using coax cable, the 3299 can be located up to 1,500m (4,920 ft) from a 3174, 3274, 4702, or 4361 WSA. Each terminal can then be located up to 1,500m (4,920 ft) from the 3299. This permits terminals to be located up to a maximum of 3,000m (9,840 ft) from a Control Unit or double the distance that is allowed when a terminal is attached directly to a 3174, 3274, 4361 WSA, or 4702.

When using the IBM Cabling System, impedance matching devices (baluns) are not required on the 3299 end of a cable. The 3299 can be located up to 1,000m (3,280 ft) from a 3274. Each terminal can then be located up to 1,000m (3,280 ft) from a 3299. These distances assume one balun is used in the cable. Refer to the IBM Cabling System documentation for recommended maximum distances between offices and wiring closets.

(Canada only> When using specified telephone twisted-pair between a 3299 and the terminals, a 3299 Model 3 should be used because it eliminates the requirement for Coax-to-Twisted-Pair adapters (CTPA) on the cable ends connecting to the 3299. The TTP cables connect directly into the 3299 model 3. Each terminal can be located up to 275m (900 ft) from the 3299 Model 3.<)

Customer Responsibilities: The customer is responsible for:

- Adequate site preparation.
- Receipt at customer's receiving dock, unpacking and placement of unit.
- Setup of unit and connection of coax and/or IBM Cabling System cables
- Performing customer problem analysis and resolution (CPAR).
- Isolating a defective unit, replacement of unit, and delivering the defective unit with failure analysis report to an IBM Service/Exchange Center for exchange.
- Determination of the required number of spares.

Spares: It is recommended that the customer replace a failing 3299 unit with a spare unit and that the customer be advised to purchase sufficient spare 3299 units for such use. The number of spare units recommended is dependent upon the number of 3299 units the customer has installed, the application requirements, and the physical locations. Determination of the required number of spares is a customer responsibility, however, the minimum number of spare units recommended is shown in the table below:

Recommended Minimum Number of Spare 3299s:

(Canada only> (Each 3299 Model should be considered separately.)<)

Number of 3299s Installed	Spare 3299s
1 - 100	1
101 - 200	2
201 - 600	3
601 - 1,000	5

The customer should be advised to test spares for correct operation before storing them.

Publications: "3299 Terminal Multiplexer, Product Information Manual", (G520-4216).

SPECIFY

Except for Mandatory Specify #2998 (AG-A/PG order), specify codes are not normally required to order a 3299. The 3-digit WT Country Code entered on the DP Machine Order will be used to select (default) the WT Country variables (power cable, plug, etc.), based on the specification most commonly used in that country. If not specified otherwise, the 3299 will be shipped with the following:

- Power (AC, 1-phase, 50/60 Hz): One power supply satisfies all power requirements. The power supply operates, without modifications or adjustments, at any voltage in the range of 100 to 240 volts at either 50 or 60 Hz.

- **Power Cord:** Each 3299 unit will be shipped with a 1.8m (6 ft) cable and plug. The plug is determined by the country code. In countries where both 100 to 127 and 200 to 240 volt ranges are applicable, a specify code must be used when a 200 to 240 volt power cable and plug is required (see below).

Only 100 to 127 volt power cords are available in these countries: Canada, Guyana, Japan, Mexico, Nicaragua, and Surinam.

Only 200 to 240 volt power cords are available in these countries: Afghanistan, Antigua, Argentina, Australia, Bangladesh, Brunei, Burma, Chile, Hong Kong, India, Indonesia, Malaysia, Nepal, New Zealand, Papua New Guinea, Paraguay, Peru, Singapore, Sri Lanka, Thailand, Uruguay and W. Samoa.

All other countries: Both 100 to 127 and 200 to 240 volt power cords are available. For these countries, a 100 to 127 volt power cord is provided (default) unless specify code #0500 is specified. 200 to 240V Power Cord: For those countries where both 100 to 127 and 200 to 240V power sources are used (see "Basic Configuration"), a 100 to 127 volt power cord is provided (default) with the basic configuration. If a 200 to 240 volt power source is to be used, #0500 must be specified to get a 200-240 volt power cord in lieu of the 100 to 127 volt power cord normally provided.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

Rack Mount (P/N 6217036): An accessory is available to mount a 3299 in a 483mm (19 inch) wide equipment rack that complies with EIA and IEC standards. Cable guides are provided for cable dressing. Tools are not required for attaching a 3299 to the accessory.

Cables: IBM Cabling System cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

IBM Cable - for proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361) and to "Using the IBM Cabling System With Communications Products" (GA27-3620). For pricing and ordering information, refer to the Systems Supplies operation with your country.

Coaxial Cable - For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual-Physical Planning", GA27-2787.

IBM 3270 DPC-T3 Adapter (P/N 83X9758): A cable adapter assembly that permits direct attachment to telephone twisted pair wire, that meets the IBM Cabling System Type 3 specifications, up to a maximum distance of 275m (900 ft.). It is 4.6m (15 ft.) in length with an IBM Dual Purpose Connector (DPC) at one end and a miniature six-pin modular telephone connector on the other end. The telephone connector can be cut off, and the wire inserted directly into telephone punch-down blocks that are capable of accepting stranded telephone wire. The accessory can also be used at the terminal end of the wire provided the terminal has an IBM Dual Purpose Connector (DPC). (Canada only) Otherwise, a CTPA is required. The IBM 3270 DPC-T3 Adapter is not required on the ends of telephone wires that attach to the terminal connectors of a 3299 Model 3.<)

Ordering: Order via NDD DRO or via Distributors authorized to market the IBM Cabling System components. Minimum order quantity is one package which contains ten IBM 3270 DPC-T3 Adapter assemblies.

SUPPLIES (NONE)

MACHINES
3310 DIRECT ACCESS STORAGE DEVICE
PURPOSE

Direct access storage for attachment to a 4331 or 4361 Processor.

MODELS

Model A1 A01	Single-drive disk storage unit and associated control for attachment to a 4331 4331 or 4361 Processor via its DASD Adapter (#3201).
Model A2 A02	Two disk storage drives and associated control for attachment to a 4331 4331 or 4361 Processor via its DASD Adapter (#3201). It also provides the logic required to support the attachment of up to two additional drives for a maximum string of four.
Model B1 B01	Single-drive storage unit which attaches to a model A2 to provide for configurations requiring three drives.
Model B2 B02	Two disk storage drives which attach to a model A2 to provide for configurations requiring a full string of four drives.

Maximum: See 4331 or 4361 pages.

Prerequisites: A 3310 Direct Access Storage Drive requires a 3310 mdl A1 or A2 and a position on the DASD Adapter of a 4331 or 4361 Processor. A mdl A2 is required to attach a mdl B1 or B2.

HIGHLIGHTS

The 3310 employs a fixed storage medium and features high data rate, fast access, modularity and a high degree of reliability.

Capacity: Each drive has a capacity of 64,520,192 bytes.

Format: The 3310 uses Fixed Block data structure and the cylinder concept providing the following:

Bytes per Sector	512
Sectors per Cylinder	352
Bytes per Cylinder	180,224
Cylinders per Drive	358

Access Time:
Seek Time (ms):

Minimum	9
Average	27

Rotational Delay (ms):

Average	9.6
---------	-----

Data Rate: 1,031,000 bytes per second.

Rotational Positioning Sensing: Permits the disk storage device to disconnect during rotational delay, thereby increasing DASD Adapter availability for other operations.

Error Correction: Provides capability of correcting single data error bursts of up to 3 bits span as well as detecting all single error bursts of up to 14 bits span.

Data Recovery: (Plant only) Should data in the field prove unrecoverable, data recovery assistance at the plant of manufacture will be provided.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage:**
(AC, 1-phase, 3-wire, 60 Hz): **#2732** for 200V, **#9902** for 208V, **#2803** for 220V, **#9914** for 240V.
(AC, 1-phase, 3-wire, 50 Hz): **#2806** for 200V, **#2813** for 220V, **#2821** for 230V, **#2801** for 240V.
Note: The 3310 meets the Japanese leakage for current requirements.
- Color (A mdls only):** **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, or **#9065** for pebble gray. **Note:** One accent panel from the mdl A unit is exchanged with the outer side panel of the mdl B.

MODEL CONVERSIONS

Model changes between 3310 model A1 and A2 or between model B1 and B2 are field installable. Model changes between 3310 model A and model B units cannot be done.

ACCESSORIES (None)
SUPPLIES (None)

3330 DISK STORAGE

(NO LONGER AVAILABLE, as of March, 1984: Models, Model Changes, Specify Features, Special Features or Accessories. RPQs have not been withdrawn.)

PURPOSE

Large capacity fast access, high data rate. Up to three 3330 modules attach to a 3333 Storage and Control to form a facility for general purpose data storage and programming system residence.

MODELS

Model 1 001: Contains two disk storage drives; available on S/360 mdl 195, any S/370 processor except 3115, the 4331 Model Group 2 and the 4341, 4361, 4381, 9375 or 9377 Processor.

Model 2 002: Contains one disk storage drive; available on S/360 mdl 195, all S/370 processors except 3115, the 4331 Model Group 2 and the 4341, 4361, 4381, 9375 or 9377 Processor.

Model 11 011: Contains two disk storage drives; available on all virtual storage S/370 processors except 3115 and 3125, the 4331 Model Group 2 and the 4341, 4361, 4381, 9375 or 9377 Processor.

Maximum: Up to four 3330 modules, in any combination of mdls 1 and 2, can be attached to the 3830 mdl 1. Up to three 3330 modules, in any combination of mdls 1, 2 or 11, can be attached to the 3333 mdl 1 or 11; see system availability above. On the 3125, only one 3330 module, either mdl 1 or 2, can be attached to the 3333 mdl 1. For combinations allowed on a storage director of a 3880 Storage Control, see "Maximum" in M3880 pages.

Prerequisites: The 3330 mdls 1 and 2 are designed for interconnected operation with the 3333 mdl 1, 3333 mdl 11, or the 3830 mdl 1. The 3330 mdl 11 is designed for interconnected operation with the 3333 mdl 1 or mdl 11. Customers who wish to order a 3330 for stand-alone or individual use should submit an RPQ to provide the necessary safety elements (covers, cable connectors, etc.) to complete the unit for a non-standard (i.e., not installed as part of a 3330 facility) environment. In lieu of the RPQ, the customer may provide safety elements equivalent to the standard configuration or that provided by the above RPQ. If not provided, the unit will be offered on a purchase-only basis. See "Specify". See appropriate DASD storage control feature or machine to determine prerequisite specify and/or special features to attach 3333/3330s.

Agreement for IBM to install and maintain the 3330 in any non-standard configuration must be reviewed with IBM.

Each disk storage drive requires a 3336 Disk Pack. These must be ordered separately. Contact IBM.

HIGHLIGHTS

Each drive uses an electromagnetic actuator to move and control the head assembly.

Cylinder Concept: 404 data cylinders per pack for mdls 1 and 2; 808 data cylinders per pack for mdl 11. Each cylinder has 19 data tracks; up to 13,030 bytes per track; up to 247,570 bytes available per cylinder.

Data Rate: 806,000 bytes per second.

Access Time: Average access time is 30ms with a minimum of 10ms and a maximum of 55ms.

Power Drawers: Each disk drive is mounted in a drawer; opened or closed by a switch on the operator control panel.

Write Inhibit Switch: A toggle switch for each drive, mounted on the operator's panel, provides the means to protect packs mounted within the facility from being written upon. The switch is manually set by the system operator under instructions from the customer operating procedure. Programming Support then protects the user's data by terminating a program which attempts to write to a protected drive.

Write Format Release: Standard feature on the mdl 11, which frees the subsystem while the drive erases from the end of a "formatted" write record to the end of the track.

Rotational Position Sensing: Enables a "seek" to an explicit position on a track; permits channel disconnect during most of the rotational latency period and thus contributes to increased channel availability; requires one unshared subchannel on a block multiplexer channel for each drive.

Multiple Requesting: Allows multiple channel command sequences to be active, up to one sequence per drive; permits better utilization of control unit, devices, channel and processor; requires one unshared subchannel on a block multiplexer channel for each drive.

Disk Pack: Each drive requires a 3336 Disk Pack. The 3336 mdl 1 provides up to 100 million bytes of storage per pack. The 3336 mdl 11 provides up to 200 million bytes of storage per pack. The 3336 mdl 1 is interchangeable on all 3330 mdls 1 and 2 and 3333 mdl 1 drives; it cannot be used with the 3330 mdl 11. The 3336 mdl 11 is interchangeable on all 3330 mdl 11 and 3333 mdl 11 drives; it cannot be used with the 3330 mdl 1 or 2.

Publications: GC20-0001

SPECIFY

- Power (AC, 3-phase, 4-wire):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	

- Non-Standard Environment: #9485 must be specified if the 3330 is not to be installed as part of a 3330 facility; also see "Prerequisites" above.
- Position Designator: For cable definition and drive identification (Ready Indicator and Logical Address Plug), one position designator code must be specified for each 3330, indicating its relative position as shown in the diagram below:

3830 mdl 1	#9491	#9492	#9493	#9494
-----	-----	-----	-----	-----
3333		#9492	#9493	#9494

Note: If any configuration change (increase or decrease) results in a position change of installed units, their position designator codes must be changed by MES for rental machines. For purchased machines, an RPQ must be submitted.

If an installed 3830 mdl 1/3330 configuration is being changed to a 3830 mdl 2/3330 series configuration and the 3330 with position designator code #9493 has serial number 12490 or below, B/M 2276789 (60 Hz) must be ordered via an MES for rental machines. For purchase machines, an RPQ must be submitted.

3333 DISK STORAGE AND CONTROL

(NO LONGER AVAILABLE, as of March, 1984: Models, Model Changes, Specify Features, Special Features or Accessories. RPQs have not been withdrawn.)

PURPOSE

Large capacity, fast access, high data rate storage for general purpose data storage and programming system residence with additional control for the attachment of up to three 3330 Disk Storage modules.

Two disk storage drives and associated control for attachment to the 3135, 3135-3, 3138 via the 3330 Series IFA (#4655), to the 3145, 3145-3, 3148 models H2, HG2, I2, IH2, and J2 via the ISC (#4660), to the 3145, 3145-3, 3148 models FED, GE, GFD, H, HG, and I via the 3345 models 3, 4, and 5, to the 3158, 3158-3, 3168, 3168-3 via the ISC (#4650), to the 3830 model 2 and to the 3880 mdl 1, 2 or 11. It provides logic and power for the attachment of up to six spindles of 3330 disk storage drives of any models.

MODELS

Model 1 001: Contains two disk storage drives; available on S/360 mdl 195, any S/370 processor except 3115, the 4331 Model Group 2 and the 4341, 4361 or 4381.

Model 11 011: Contains two disk storage drives; available on any virtual storage S/370 processor except 3115 or 3125, the 4331 Model Group 2 and the 4341, 4361 or 4381.

Maximum: 3125: one 3333 mdl 1 (with associated 3330s). For other systems, see M3135, 3135-3, 3138, 3145, 3145-3, 3148, 3158, (Japan only > 3158 (Submodel 2), <) 3158-3, 3168, 3168-3, 3031, 3032, 3033, 4341, 4361, 4381, 3345, 3830-2, 3830-3 or 3880 pages.

Prerequisites: Each disk storage drive requires a 3336 Disk Pack. These must be ordered separately. Contact IBM.

See appropriate DASD storage control feature or machine to determine prerequisite specify and/or special features to attach 3333/3330s.

Each system attachment requires a specify code. See "Specify" below.

Note: If a 3333/3330 configuration is replacing a 3830 mdl 1/3330 configuration (or any configuration change is made where installed 3330s are repositioned with respect to a 3333), the position designator specify codes of the 3330s must be changed via MES. See M3330 pages.

HIGHLIGHTS

Each drive uses an electromagnetic actuator to move and control the head assembly.

Cylinder Concept: 404 data cylinders per pack for mdl 1; 808 data cylinders per pack for mdl 11. Each cylinder has 19 data tracks; up to 13,030 bytes per track; up to 247,570 bytes available per cylinder.

Data Rate: 806,000 bytes per second.

Access Time: Average access time is 30ms with a minimum of 10ms and a maximum of 55ms.

Power Drawers: Each disk drive is mounted in a drawer; opened or closed by a switch on the operator control panel.

Write Inhibit Switch: A toggle switch for each drive, mounted on the operator's panel, provides the means to protect packs mounted

within the facility from being written upon. The switch is manually set by the system operator under instructions from the customer operating procedure. Programming Support then protects the user's data by terminating a program which attempts to write to a protected drive.

Write Format Release: Standard feature on the mdl 11, which frees the subsystem while the drive erases from the end of a "formatted" write record to the end of the track.

Rotational Position Sensing: Enables a "seek" to an explicit position on a track; permits channel disconnect during most of the rotational latency period and thus contributes to increased channel availability; requires one unshared subchannel on a block multiplexer channel for each drive.

Multiple Requesting: Allows multiple channel command sequences to be active, up to one sequence per drive; permits better utilization of control units, devices, channel, and processor; requires one unshared subchannel on a block multiplexer channel for each drive.

Disk Pack: Each drive requires a 3336 Disk Pack. The 3336 mdl 1 provides up to 100 million bytes of storage per pack. The 3336 mdl 11 provides up to 200 million bytes of storage per pack. The 3336 mdl 1 is interchangeable on all 3333 mdl 1 and 3330 mdl 1 and 2 drives; it cannot be used with the 3333 mdl 11. The 3336 mdl 11 is interchangeable on all 3333 mdl 11 and 3330 mdl 11 drives; it cannot be used with 3333 mdl 1.

Maintenance: Agreement for IBM to install and maintain the 3333 in any non-standard configuration must be reviewed with CE Management prior to making a commitment to the customer.

Publications: GC20-0001

SPECIFY

- Power (AC, 3-phase, 4-wire):

50 Hz	60 Hz
200V #2807	200V #2733

235V #2818	230V #9905
380V #2816	
408V #2819	

Note: The 3333 requires a 60 amp AC power outlet. Consult Physical Planning Manual.

- System Attachment: One of the following must be specified:

Attachment	Specify
3125*	#9586
3135, 3135-3 IFA	#9582
3138 IFA	#9579
3145, 3145-3 ISC	#9583
3148 ISC	#9580
3158 ISC	#9584
3158 ISC w/#7220	#9587
3168 ISC	#9585
3168 ISC w/#7220	#9588
3345 mdls 3, 4, 5	#9583
3830 mdl 2	#9581
3830 mdl 3	#9589
3880 mdl 1, 2, 11	#9604

* The 3125 is not valid for the String Switch (#8150).

- Language Groups:

MACHINES

English #2927 Italian #2932
French #2928 Spanish #2931
German #2929

3830 mdl 3 #9599
3880 mdl 1,2, or 11 #9605

Note: Installed 3333s retained for use with 3850 Mass Storage System:

SPECIAL FEATURES

Remote Switch Attachment (#8148): To attach the String Switch (#8150) to a configuration control panel. Field Installation: Yes. Prerequisites: #8150.

String Switch (#8150): To attach the 3333 to a second attachment. The two attachments may be on the same processor or different processors and may be any two of the following: 3830 Storage Control mdl 2, 3135, 3135-3, 3138 3330/3340 Series IFA (#4655), the 3345 Storage and Control Frame mdls 3, 4 and 5 or the ISC (#4660) for attachment to 3145, 3145-3, 3148, and the 3158 and 3168 ISCs (#4650). See appropriate machines for additional requirements. The String Switch may also be installed on a 3333 within a 3850 Mass Storage System with attachment to a 3830 mdl 3 or 3158/3168 ISC (#4650) with Staging Adapter (#7220). Installation is not recommended in a mixed 3850 MSS/non-MSS environment. If a 3333 is shared between any two ISC paths and/or 3830 mdl 3s, then any other 3333s attached to the same ISC paths and/or 3830 mdl 3s must also be shared identically. In all of the above cases, switching between the two attachments is under program control. The 3333s may also be dedicated to a single attachment with an enable/disable switch. Field Installation: Yes. Specify: To indicate the second attachment to which this feature will be made, specify one of the following:

Attachment	Specify
3135, 3135-3 IFA	#9592
3138 IFA	#9601
3145, 3145-3 ISC	#9593
3148 ISC	#9602
3158 ISC	#9594
3158 ISC w/ (#7720)	#9597
3168 ISC	#9595
3168 ISC w/ (#7220)	#9598
3345 mdls 3,4,5	#9593
3830 mdl 2	#9591

System Attachment Specify Features must be changed on presently installed 3333s attached to a 3830 mdl 2 or 3158/3168 ISC (#4650), if the 3333s will be retained for use with a 3850 MSS when a 3830 mdl 2 is field upgraded to mdl 3 or Staging Adapter for ISC (#7220) is field installed on the 3158/3168 ISC. Submit MES(s) to effect the following:

Specify Feature Changes
Remove Install

#9581	#9589
#9584	#9587
#9585	#9588

If the installed 3333s are equipped with String Switch (#8150), the specify features indicative of String Switch attachment are also to be changed by MES:

Specify Feature Changes
Remove Install

#9591	#9599
#9594	#9597
#9595	#9598

MODEL CONVERSIONS

Model 1 to model 11 is field installable.

ACCESSORIES (NONE)

SUPPLIES

Contact IBM.

3340 DIRECT ACCESS STORAGE FACILITY

(NO LONGER AVAILABLE as of March 1984: Mdl's B01 and C02, Model Changes, Specify Features, Special Features and Accessories are no longer available. RPQs are available.

(NO LONGER AVAILABLE as of August 1984: Mdl's A02 and B02, Model Changes, Specify Features, Special Features and Accessories are no longer available. RPQs are available.

PURPOSE

Multiple capacity, high-speed, direct access storage for attachment to a S/3 mdl 12 or S/3 mdl 15 with B, C or D model Processing Unit, S/7 with E model Processing Unit, any virtual storage S/370, 4300, 9375 or 9377 Processor.

MODELS

Model A2 A02: Two disk storage drives and associated control for attachment to a S/3 mdl 15, with B, C, or D model Processing Unit via native attachment, or a S/7 equipped with a 5988-T01, 3340 Attachment Module. It provides logic and power for the attachment of up to three 3340 mdl B units. Also for attachment to a 3115 or 3125 via their native attachments, to the 3135, 3135-3, 3138 via the IFA (#4655), to 3145 mdls GE, GFD, H, HG or I via the 3345 mdl 3, 4 or 5, to 3145 mdl H2, HG2, I2, IH2, J2, JI2 or K2, 3145-3, 3148 via the ISC (#4660), to the 4321 or 4331 via the 3340/3344 Direct Attach feature (#7851), to the 3158, 3158-3, 3168 or 3168-3 via the ISC (#4650), to the 3830 mdl 2, and to the 3880 mdl 1 or 2. It provides logic and power for the attachment of up to three 3340 mdl B units and/or 3344 units.

Model B1 B01: Contains one disk storage drive.

S/7, S/370 or 4300 processor: Up to three can be attached to a 3340 mdl A2 to provide 3-, 5- or 7-drive configurations. Can be combined with 3340 mdl A2, B2s and/or 3344 units for a 5-, 6- or 7-drive configuration.

S/3 mdl 15 with B, C, or D model processor: One can be attached to a 3340 mdl A2 to provide a 3-drive configuration.

Model B2 B02: Contains two disk storage drives.

S/7, S/370 or 4300 processor: Up to three 3340 mdl B2s can be attached to a 3340 mdl A2 for a 4-, 6- or 8-drive configuration. Can be combined with 3340 model A2, B1s and/or 3344 units for a 5-, 6- or 7-drive configuration.

S/3 Mdl 15 with B, C, or D Model Processor: One can be attached to a 3340 Mdl A2 to provide a 4-drive configuration.

Model C2 C02: Contains two disk storage drives.

S/3 Model 12: One can be attached directly to the 5412 to provide a 2-drive configuration.

Maximum:

3115-0 - four 3340 drives
3115-2 - eight 3340 drives
3125-0 - eight 3340 drives
3125-2 - sixteen 3340 drives
Other S/370s, or 4300 processors - see M3135, 3135-3, 3138, 3145, 3145-3, 3148, 3158, 3158-3, 3168, 3168-3, 3031, 3032, 3033, 3345, 3830-2 or 3880-1,2 pages.

S/3 mdl 12 - two 3340 drives (C2), S/3 mdl 15B, 15C, or 15D - four 3340 drives, S/7 mdl E - eight 3340 drives.

Prerequisites: A 3340 facility requires: a 3340 mdl A2 (except S/3 mdl 12, which supports only 3340 mdl C2) -- a S/3 Mdl 15 with a B, C, or D mdl processor, S/7 with a 5998-T01 Module -- a S/370 or 4300 processor with appropriate attachment and features -- each 3340

drive requires a 3348 Data Module. A 3145 requires Word Buffer (#8810) to attach 3340s.

S/3: For conversion of a 5415A mdl CPU to a 5415B, 5415C, or 5415D mdl CPU, the MES must indicate deletion of #9400, and if a second 5444 is installed, deletion of #9401 or #9402.

See appropriate DASD storage control feature or machine to determine additional prerequisite specify and/or special features to attach 3340s.

HIGHLIGHTS

- Each 3340 contains an air filtration system and the load/unload mechanism for the 3348 Data Module. Features low cost, multiple capacity, fast access and high data rate -- two drives (C2 only) attach to a S/3 mdl 12 -- up to 4 drives attach to a S/3 mdl 15 B, C or D, or a 3115-0 -- up to 8 drives attach to a S/7, to a 3115-2 or a 3125-0 -- up to 16 drives to a 3125-2 with 16 Drive Expansion (#9315), and up to 16 drives to a 4331. See M3135, 3135-3, 3138, 3145, 3145-3, 3148, 3158, 3158-3, 3168, 3168-3, 3031, 3032, 3033, 3345, 4331, 4341, 3830 or 3880 pages for other S/370 or 4300 processor attachment capabilities.
- The 3340 introduces a new design in which a sealed cartridge (3348 Data Module) contains the disks, access arms, read/write heads and spindle. Multiple capacity options on each drive become possible due to the modularity provided by this unique design. In addition, the 3348 mdl 70F contains fixed heads which provide low cost, fixed head capability for the 3340 user. Users may place selected components of IBM software as well as his own programs in the fixed head area to increase device performance. The 3348 mdl 70F requires the Fixed Head Feature (#4301) on the 3340. The 3348 mdl 70F is not available on the S/3 mdl 12 or mdl 15.
- The 3340 supports the command set of the 3330. This is essentially the same as the 2314 command set with minor modifications.

Cylinder	3348 mdl 70		
Concept:	3348 mdl 35 or 70F	3348 mdl 70	
	(34.9 MB)	(69.8 MB)	(41.0 MB)
	(Note 1)	(Note 1)	(Note 2)
Bytes per Track	8,368	8,368	12,288
Tracks per Cylinder	12	12	20
Cylinders per Data Module	348	696	210*
Bytes per Cylinder	100,416	100,416	245,760

Note 1: Mdl 35, 70 or 70F for S/7, S/370 or 4300 processors.

Note 2: Mdl 70 on S/3 mdl 12 or mdl 15.

* Note: For the mdl 12 or 15, these are "logical" cylinders rather than physical cylinders. For capacities on the S/7, see S/7 under 3348.*

Data Rate: 885,000 bytes per second. See GA09-1004 for Data Rate on S/7.

Access Time: For the 3348 mdl 35 and 70, the average seek time is 25 ms with a minimum of 10 ms and a maximum of 50 ms. For the mdl 70F, the average seek time is 0 ms for cylinders 1 through 5 while all other cylinders retain the above seek timing. Rotation time is 20.2 ms and latency is 10.1 ms, the same as for the 3348 mdls 35 and 70.

Autoloading: Data modules are automatically loaded after the Data Module is placed in the drive, the drive cover is closed and a switch is turned on. The Data Module is a sealed unit and requires no cover removal. Start up time is less than 20 seconds.

Read-Only: A switch is provided on every 3340 drive. This switch is activated by inserting a latch in the Data Module. When the latch is NOT inserted, the Data Module is protected from being written upon or erased.

Data Modules: Each drive requires a Data Module to operate. These must be ordered separately -- see M3348 pages.

3348 Data Module mdl 35 provides 34,944,768 bytes of storage for the S/370 and 4300 processors.
3348 Data Module mdl 70 provides 69,889,536 bytes of storage for the S/370 and 4300 processors. For S/3 mdl 12 and mdl 15, it provides 41,041,920 bytes of main data storage plus 9,830,400 bytes for program support. Note: S/3 mdl 12 and mdl 15 can only utilize the 3348 Data Module mdl 70.
3348 Data Module mdl 70F provides 69,889,536 bytes of storage of which 502,080 are accessible by fixed heads.

Either the mdl 35 or 70 may operate on any drive and they are interchangeable between drives, including drives with the Fixed Head Feature (#4301, 4302) installed. The mdl 70F, however, requires the Fixed Head Feature on the drive.

Data written on a Data Module by S/3 cannot be retrieved by S/370, and vice versa. Data written on a Data Module by a S/3 Mdl 12 or 15 may be used by a 4331 using the S/3 Data Import Feature (#6305).

Bibliography: GC20-0001

SPECIFY

- Power (AC, 3-phase): (must be consistent with system voltage)

50 Hz 5-wire	60 Hz 4-wire
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	

- Machine Nomenclature:

English #2927	Italian #2932
French #2928	Portuguese #2938
German #2929	Spanish #2931

- Color: Blue #9043 -- Gray #9045 -- Red #9041 -- White #9046 -- Yellow #9042.

- System Attachment: One of the following must be specified on each 3340 mdl A2:

Attachment	Specify
S/3 mdl 15*	#9589
S/7 mdl E	#9590
3830 mdl 2	#9581
3135 IFA	#9582
3135 mdl 3 IFA	#9582
3138 IFA	#9579
3345 mdls 3, 4, 5	#9583
3158 ISC	#9584
3880 mdl 1 or 2	#9607
3168 ISC	#9585
3125 DDA	#9586
3115 DDA	#9587
3145 ISC	#9588
3145 mdl 3 ISC	#9588
3148 ISC	#9580
4321, 4331 3340	

Direct Attach #9606

* Note: Specify #9589 must also be used for a mdl B1 or B2 attached to the 3340 A2 to provide a 3 or 4-drive system.

- The following must be specified for a 3340 Mdl C2:

Attachment Specify

S/3 mdl 12 #9600

- If String Switch (#8150) is ordered or installed on 3340 mdl A2, String Switch (#9570) must be specified on each 3340 mdl B1 or B2 in the string.

SPECIAL FEATURES

Fixed Head Feature (#4301, #4302): #4301 for mdl A2 or B2 -- #4302 for mdl B1. To operate the 3348 mdl 70F on the 3340. The Fixed Head Feature is available on S/7, S/370 VS systems from the 115 and up, and 4300 processors. Attachment is via the following: On S/7, via the 5998-TO1. On the 3115 and 3125 via their native attachment, the 3830 Storage Control mdl 2, the 3880 Control Unit, the 3330/3340 Series IFA (#4655) on the 3135, 3135-3, 3138, the 3345 Storage Control Frame mdl 3, 4 or 5, the ISC (#4660) on the 3145, 3145-3, 3148, the ISC (#4650) on the 3158 and 3168, and the 4321 or 4331 via the 3340/3344 Direct Attach Feature (#7851). See appropriate machines for additional requirements. Limitations: Not available on 3340s attached to S/3 mdl 12 or mdl 15. Cannot be installed with either the 2311 mdl 1/3340 Series Compatibility (#8060) or the 2314/3340 Series Compatibility (#8070) on 3115 and 3125. Cannot be installed with Two-Channel Switch, Add'l (#8171) on the 3830 mdl 2 unless specify #9317 or #9310 is installed on the 3830. Field Installation: Yes.

Remote Switch Attachment (#6148): (Mdl A2) To attach the String Switch (#8150) to the configuration control panel of a 3158MP or 3168MP. Field Installation: Yes.

Rotational Position Sensing (#6201, #6202): #6201 for mdl B1 -- #6202 for mdl A2 or B2. Permits channel disconnect during most of the rotational latency period and thus contributes to increased channel availability. If required, it should be installed on every 3340 mdl A2, B2 or B1 in a string. Limitations: This feature may be installed but is not supported by the 4321 or 4331 processor 3340/3344 Direct Attachment Feature (#7851). Field Installation: Yes. Prerequisites: A block multiplexer channel on the system.

String Switch (#8150): (Mdl A2) To attach the 3340 mdl A2 to a second attachment. The two attachments may be on the same processor or different processors and may be any two of the following: 3830 Storage Control mdl 2, the 3880 Control Unit, the 3340 Direct Disk Attachment (DDA) on the 3115-2 or 3125-2, the 3330/3340 Series IFA (#4655) on the 3135, 3135-3, 3138, the 3345 Storage and Control Frame mdl 3, 4 or 5, the ISC (#4660) for attachment to the 3145, 3145-3, 3148, the ISC (#4650) for 3158 and 3168, and the 3340/3344 Direct Attachment Feature (#7851) on the 4321 or 4331. See appropriate machines for additional requirements. Switching between two attachments is under program control. The 3340 may also be dedicated to a single attachment with an enable/disable switch. Field Installation: Yes. Specify: To indicate the attachment to which this feature will be made, specify one of the following:

Attachment	Specify
3880 mdl 1 or 2	#9707
3830 mdl 2	#9591
3135, 3135-3 IFA	#9592
3138 IFA	#9601
3345 mdls 3, 4, 5	#9593
3145, 3145-3 ISC	#9593
4331	#9608
3148 ISC	#9602
3158 ISC	#9594
3168 ISC	#9595
3115-2 DDA	#9596
3125-2 DDA	#9597

In addition, String Switch (#9570) must be ordered on each 3340 mdl B1 or B2 which will be attached to the 3340 mdl A2 with String Switch (#8150).

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

3344 DIRECT ACCESS STORAGE

NO LONGER AVAILABLE as of March 1984: Model B2F, B2F Model Changes, B2F Specify Features, B2F Special Features and Accessories for B2F are no longer available. RPQs are available.

PURPOSE

Dual drive, large capacity, direct access storage for attachment via a 3340 model A2 to a System/3 model 15D, to any virtual storage S/370, 4300, 9375 or 9377 Processor.

MODELS

Model B2 B02: 2-drive disk storage unit which attaches to a 3340 model A2. It may be intermixed with 3340 model B units and/or 3344 model B2F units in any combination up to three B units per 3340 model A2. On System/3 model 15D, one 3344 B2 can be attached to a 3340 A2 to make a 4-drive system.

Model B2F B2F: (NO LONGER AVAILABLE) 2-drive disk storage unit with the same attachment capabilities as the 3344 mdl B2. It features Fixed Heads which provide 1,004,160 bytes of zero seek time storage on each drive.

Limitations: A 3340 string containing the 3344 may not be intermixed with a 3330 string on a 3135, 3135-3, 3138 IFA or 3880 mdl 1 or 2. 3340 strings containing the 3344 cannot be intermixed with 3330 or 3350 strings on a 3145, 3145-3, 3148, 3345, 3158, 3168 ISC or 3830 mdl 2.

Data written by System/3 cannot be retrieved by S/370, 4341 or 4381 processors, and vice versa. For the 4331 or 4361, see System/3 Data Import Feature (#6305).

Maximum: One 3340 string on a 3115-2/3125-2 DDA or on a 3135, 3135-3, 3138 IFA may contain 3344s.

Up to two 3340 strings on a 3830 mdl 2, 3880 mdl 2, 3145, 3145-3, 3148 or 3345 ISC, on each path of a 3158 or 3168 ISC, on each DASD adapter of the 4331 or on each director of 3880 mdl 1, 3880 mdl 1, may contain 3344s.

Prerequisites: A 3344 requires a 3340 mdl A2 and any virtual storage S/370 or 4300 processor with appropriate attachment and features. Control Store Extension (#2150) and Register Expansion (#6111) are prerequisite features on the 3830 mdl 2 and 3145, 3145-3, 3148, 3345, 3158, 3168 ISCs to attach 3344. On the 3115-2 and the 3125-2, 4K DASD Control Storage Extension (#4210) is required. On 3880, 3340/3344 Attachment feature is required.

For use with System/3 mdl 15D, a 5415D with specify #9781 and #9784 and a 3340 mdl A2 are required.

IMPORTANT: See the appropriate DASD storage control feature or machine to determine any additional prerequisite specify and/or special features to attach 3344.

HIGHLIGHTS

- The 3344 features a large capacity, fixed storage medium. Each drive is equivalent in capacity and format to four logical 3348 mdl 70s. Each 3344 has two drives and requires eight logical device addresses. The Fixed Head storage capacity on the 3344 mdl B2F is associated with the first of the four logical volumes on each drive.
- On S/3 mdl 15D, each drive is approximately equivalent to four logical 3348 mdl 70s - each logical volume features a larger main data area, and a smaller area reserved for simulation, than on a 3348 data module.

Cylinder concept: Except for System/3, each drive has 2,784 logical cylinders with 12 tracks per cylinder. Maximum track capacity is 8,368 bytes providing up to 100,416 bytes per logical cylinder.

For the System/3 mdl 15D, each drive has 828 logical cylinders with 20 tracks per cylinder. Maximum track capacity is 12,288 bytes providing up to 245,760 bytes per logical cylinder.

Maximum drive capacity is 203,489,280 bytes. Data Rate - 885,000 bytes per second.

The 3344 mdl B2 provides 279,558,144 bytes of storage per drive.

The 3344 mdl B2F provides 279,558,144 bytes of storage per drive of which 1,004,160 bytes are accessible by fixed heads.

Data Rate: 885,000 bytes per second.

Access Time: Average seek time is 25ms with a minimum of 10ms and a maximum of 50ms. Rotation time is 20.2ms and latency is 10.1ms. For the 3344 mdl B2F, logical cylinders 1 through 10 of the first logical volume on each drive have a seek time of zero ms while all other cylinders retain the above seek timing.

Read-Only: A 2-position switch is provided for each drive. When the switch is in the "read only" position, the drive is protected from being written upon or erased.

Rotational Position Sensing (RPS): A standard feature on the 3344 which permits channel disconnect during most of the rotational latency period and thus contributes to increased channel availability. Requires a block multiplexer channel on the system. If RPS is used, it is advisable for efficient operation to also have it on every 3340 in a string.

Data Recovery: (Plant only) Should data in the field prove unrecoverable, data recovery assistance at the plant of manufacture will be provided. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning the head and disk assembly to the plant for data recovery.

Alternate Tracks: Except for System/3, there are 96 alternate tracks per drive. The 3344 will be shipped from the plant with not more than five flagged tracks per drive. Therefore, a minimum of 91 alternate tracks per drive are available for customer use.

For the System/3 mdl 15D, there are 160 alternate tracks per drive (40 per logical volume). The 3344 will be shipped from the plant with not more than five flagged tracks per drive. Therefore, a minimum of 155 alternate tracks per drive are available for customer use.

Publications: S/370 and 4300 processors -- GC20-0001; System/3 -- GC20-8080.

3350 DIRECT ACCESS STORAGE

PURPOSE

High-speed, large capacity, direct access storage for attachment to any virtual storage S/370 Processor (except 3115 or 3125), 30XX Processor, 4331 (Model Group 2), 4341, 4361, 4381, 9375 or 9377 Processor.

MODELS A2, A2F, B2, B2F, C2, C2F

Model A2 A02: Two-drive disk storage and associated control for attachment to 3145 mdl GE, GFD, H, HG or I via the 3345 mdl 3, 4 or 5, to the 3145 mdl H2, HG2, I2, IH2, J2, JI2 or K2 via the ISC (#4660), to the 3145-3 or 3148 via the ISC (#4660), to the 3158 or 3168 via the ISC (#4650), to the 3830 mdl 2 or 3, to the 3880 mdl 1, 2 or 11. It provides logic and power for the attachment of up to three 3350 mdl B2/B2F units or up to two mdl B2/B2F units and one C2/C2F unit.

Model A2F A2F: Two-drive disk storage and associated control with the same attachment capabilities as the mdl A2. It features Fixed Heads which provide up to 1,144,140 bytes of zero seek time storage on each drive in lieu of the same capacity under the moving heads.

Model B2 B02: 2-drive disk storage unit. Up to three 3350 mdl B2/B2Fs can be attached to a 3350 mdl A2/A2F.

Model B2F B2F: Two-drive disk storage unit with the same attachment capabilities as the mdl B2. It features Fixed Heads which provide up to 1,144,140 bytes of zero seek time storage in each drive in lieu of the same capacity under the moving heads.

Model C2 C02: Two-drive disk storage and associated control. Provides an alternate controller function within a 3350 string. The mdl C2 functions as a mdl A2 or B2 depending upon the setting of a manual switch on the unit. A 3350 string containing a mdl C unit requires a mdl A unit with Primary Controller Adapter (#1320) and may include 0, 1 or 2 mdl B2/B2F units.

Model C2F C2F: 2-drive disk storage and associated control with the same attachment capabilities as the mdl C2. It features Fixed Heads which provide up to 1,144,140 bytes of zero seek time storage in each drive in lieu of the same capacity under the moving heads.

Maximum: See M3145, 3145-3, 3148, 3158, 3168, 3345 ISCs, 3830 mdl 2 or 3, 3880, 9370 pages.

Prerequisites: A 3350 DAS requires a 3350 mdl A2 or A2F; any virtual storage 4331 (Mdl Group 2), 4341, 4361 or 4381 processor or S/370 processor (except 3115 or 3125) with appropriate attachment and features. A 3145 requires Word Buffer (#8810) (standard on 3148 and a prerequisite to 3145-3) to attach 3350s. Expanded Control Store (#2151), Control Store Extension (#2150), and Register Expansion (#6111) are required on the 3830 mdl 2 or 3158, 3168 ISCs to attach 3350. Expanded Control Store (#2152) and Register Expansion (#6111) are required on the 3145, 3145-3, 3148 or 3345 ISCs, or 3830 mdl 3 to attach 3350.

Note: See the appropriate DASD storage control feature or machine to determine any additional prerequisite Specify and/or Special Features to attach a 3350.

HIGHLIGHTS

- The 3350 features high data rate, fast access, multiple formats and low cost per byte. It employs a fixed storage medium.
- Selective Format: Drive format may be 3330 mdl 1 or 3330 mdl 11 compatibility mode or 3350 native mode. Format is specified at time of order by individual drive. Format changes may be made by CE in the field. In 3330 mdl 1 or mdl 11 compatibility mode the Fixed Head storage capacity on the mdl A2F, B2F and C2F is 742,710 bytes per drive. In 3330 mdl 1 com-

patibility mode this Fixed Head storage capacity is associated with the first of the two logical 3330 mdl 1 volumes on each 3350 drive. In 3350 native mode Fixed Head storage capacity on the mdl A2F, B2F and C2F is 1,144,140 bytes per drive.

Cylinder Concept:	3330 Mdl 1 Mode	3330 Mdl 11 Mode	3350 Native Mode
Bytes per Track	13,030	13,030	19,069
Tracks per Logical Cyl.	19	19	30
Logical Cylinders per Drive	2x404	808	555
Approx. capacity/drive (MB)	2x100	200	317.5

- Data Rate: 1,198,000 bps.
- Access Time: Average seek time is 25ms with a minimum of 10ms and a maximum of 50ms. Average rotational delay is 8.4ms. For 3350 mdl A2F, B2F and C2F cylinders 1 and 2 (3350 Native Mode), or cylinders 1 through 3 (3330 mdl 11 compatibility mode), or cylinders 1 through 3 of the first of the two logical volumes on a drive (3330 mdl 1 compatibility mode), have a seek time of zero ms. All other cylinders retain the above seek timing.
- Error Correction: Provides capability of correcting single data error bursts of up to four bits span as well as detecting all single error bursts of up to ten bits span.
- Write Format Release: Frees the subsystem while the drive erases from the end of a formatted write record to the end of the track.
- Rotational Position Sensing: Permits channel disconnect during period of rotational latency, thereby providing greater channel availability -- requires one unshared subchannel on a block multiplexer channel for each logical device.
- Command Retry: Enables the storage control to recover from certain subsystem errors without recourse to system error recovery procedures.
- Read Only: A two position switch is provided for each drive. When the switch is in the "read only" position, the drive is protected from being written upon or erased.
- Data Recovery (Plant Only): Should data in the field prove unrecoverable, data recovery assistance at the plant of manufacture will be provided. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning the head and disk assembly to the plant for data recovery.
- Flag Free: The 3350 will be shipped flag free.

Publications: GC20-0001

SPECIFY

- Power (AC, 3-phase):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905

MACHINES

380V #2816
408V #2819

- Language:

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931

- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.

- Format:

	First	Second
	Drive	Drive

3330 mdl 1		
Compatibility Mode	#9731	#9732
3330 mdl 11		
Compatibility Mode	#9741	#9742
3350 Native Mode	#9751	#9752

- #9608 must be specified for attachment to a 3880 mdl 1 or 11 Storage Control Unit.

Note: In addition to the standard control attachment (#9608) for a 3880 mdl 1 or 11 Storage Control Unit, mdl A2/A2F with string switch (#8150) attaching to another 3880 mdl 1 or 11 Storage Control Unit must specify (#9608) a total of twice. Mdl C2/C2F with string switch (#8150) attaching to a 3880 mdl 1 Storage Control must specify (#9608) only once.

SPECIAL FEATURES

Primary Controller Adapter (#1320): (Mdl A2, A2F) Permits selection/deselection of the controller of the A2/A2F unit as the on-line controller via a manual switch on the C2/C2F unit in the string. Maximum: One per A2/A2F unit. Field Installation: Yes. Corequisites: One C2 or C2F unit in the string.

Remote Switch Attachment (#6148): (Mdl A2, A2F, C2, C2F) To attach the String Switch (#8150) to the configuration control panel of a S/370 mdl 158MP or 168MP. Field Installation: Yes.

String Switch (#8150): (Mdl A2, A2F, C2, C2F) To link the 3350 to a second attachment. The two attachments may be on the same CPU or different CPUs and may be any two of the following: 3830 Storage Control mdl 2 or 3, 3880 Storage Control mdl 1, 2 or 11, the 3345 Storage and Control Frame mdl 3, 4 or 5, or the ISC (#4660) for attachment to S/370 mdl 145, 145-3 or 148, or the ISC (#4660) for attachment to S/370 mdl 158 or 168 -- see appropriate machines for additional requirements. Switching between the two attachments is under program control. The 3350 may also be dedicated to a single attachment with an enable/disable switch. Limitations: See 3880 mdl D11 for restriction on use of #8150 when attached to the paging storage director. Field Installation: Yes. Specify: The attachment to which this feature will be made must be indicated -- see "Specify" for System Attachment.

MODEL CONVERSIONS

Model changes between 3350 mdl A and mdl B units, or mdl C and mdl B units are available at time of manufacture only. Model changes between 3350 mdl A and mdl C units are not recommended for field installation. Model changes between A2 and A2F units, or B2 and B2F units, or C2 and C2F units are field installable.

Note: Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this mdl change involves the removal of parts which become the property of IBM."

ACCESSORIES (NONE)

SUPPLIES (NONE)

3363 OPTICAL DISK DRIVE

PURPOSE

The IBM 3363 Optical Disk Drive is a new high-performance removable disk storage device. It utilizes the high density characteristics of optical storage technology to achieve very high capacity (200Mb) on a small 130mm (5.25-inch) removable disk. It is designed to attach to the IBM PC, PC/XT, Portable, PC/AT, PC/3270, AT/3270, and all models of the IBM Personal System/2 via a special controller card connecting to the PC I/O Bus. Two drives can be attached to a single controller card. Depending on the IBM PC model, from one to four controller cards can be supported yielding from 200Mb to 1.6Gb of removable, write once, online storage capacity. The 3363 consists of three models (A01, A11, and B01) which are external stand-alone units. There is also an internal optical disk drive for 8560 and 8580 only. This drive is #8700 on those models. The device software contains a file driver providing commands which are compatible with most PC/DOS magnetic disk commands. It also provides extensions to PC/DOS supporting multiple versions of files and files of greater than 32Mb. The 3363 is recommended as a supplement to a fixed-disk for higher capacity storage, and for applications where removability of the disk is important (e.g., security, archive, portable data, and personal disks for individual uses).

MODELS

Model A01: The Model A01* attaches to current IBM PCs and the 8530 as the first drive.

Model A11: The Model A11* attaches to the 8550, 8560, and 8580, as the first drive.

Model B01: The Model B01 attaches to Models A01, A11, and #8700 as a second drive.

#8700 Feature*: Attaches as an internal drive on 8560 and 8580 only.

* Includes the controller card.

Limitations:

- Not compatible with the IBM XMA Card.
- Not compatible with any version of TopView.

Maximum: Up to two drives may be attached to a single controller card. The current IBM PCs plus the 8530 will support one controller card and a maximum of two drives. The 8550 will support up to three controller cards and a maximum of six drives, while the 8560 and 8580 will support up to four controller cards and a maximum of eight drives.

Prerequisites: An IBM PC using PC/DOS 3.2 and higher. Minimum storage requirements for the File System Driver is 105K. Total storage requirements should be reviewed in order to determine if the 3363 File System Driver will impact current or planned applications.

Customer Setup (CSU): Yes.

HIGHLIGHTS

- Provides 200Mb of storage per cartridge.
- Up to 8 drives can be attached depending on PC model.
- Supports PC applications which use Interrupt 21 DOS Read/Write commands.
- Supports multiple versions of the same name file.
- Supports file sizes greater than 32Mb.

- Burst data rate of 2.5M bps at the read amplifier.
- Average seek over 1/3 of the disk is less than 230ms.
- Shorter average seek for up to 101 tracks is less than 45ms.

DESCRIPTION

The 3363 Optical Disk Drive is a mass storage device designed specifically for IBM Personal Computers. It should be viewed as a supplement to a fixed disk, and for applications where removability of the disk is important (e.g., security, archive, backup, etc.).

The 3363 is available as both external models and internal feature. The external drive is a stand-alone unit with its own power supply, while the internal feature derives its power from the PC. The 3363 can be attached to most current models of the IBM PC as well as all models of the IBM Personal System/2. The exceptions are: PCjr, PC Convertible, the PC/370 models, and the RT PC. The 3363 attaches to the IBM PC via a new controller card which plugs into the system board and is connected to the PC standard I/O Bus. One or two drives can be attached to the controller card.

The 3363 utilizes a small 130mm (5.25-inch) write once, removable optical disk, housed in a protective cartridge. The optical disk is a plastic media with recording on one side. The cartridge has a 200Mb capacity. Depending on the PC model from one to eight 3363 Optical Disk Drives may be attached yielding a total of 200Mb to 1.6Gb of online direct access storage.

The 3363 utilizes a spiral format consisting of 512-byte sector, 23 sectors per track, and 17,100 tracks. Data is read or written using a Laser Read/Write head. The IBM Optical Disk Cartridge can be pre-recorded with data much like diskettes are today. Thus, large electronic text or databases can be distributed on a reliable media that can also be updated as the data changes.

The 3363 has a burst data rate of up to 2.5M bps at the output of the read amplifier, with peak data transfer rate being a function of the attaching system. Data is recorded contiguously along the spiral starting at the first available sector. The user application can optimize performance by taking advantage of this recording technique to produce a 64Kb streaming effect, when doing large sequential transfers of data, with a single command.

Average seek time over one-third of the disk surface (5,700 tracks; 67Mb) is less than 230ms. The 3363 also has a shorter average seek time of less than 45ms for up to 101 tracks (1.2Mb). This is accomplished by simply changing the angle of the laser beam.

The 3363 is supported by new software and optical BIOS which provide extensions to DOS. The software design incorporates a directory structure that optimizes the directory search speed and the disk space utilization. The directory design in conjunction with a new File System Driver makes the 3363 appear rewritable to the user application. The software support also provides compatibility with most DOS commands.

New functions such as multiple versions are available with the 3363 software. With this support the user can keep back versions of the same file name. Manipulation of versions is supported by new commands designed to look like standard DOS commands. They provide the hooks to enable user applications to take advantage of the versions capability for any file. Another new function, provided by the 3363 software support, is the ability to create data files greater than 32Mb in size. This provides flexibility in the user's capability of using the 200Mb capacity of the IBM Optical Disk Cartridge. There is also a new Save/Restore function allowing the user to save only changed data files while maintaining the integrity of the directory structure. This ability, together with versions support, provides users with an automatic audit trail and archive for future reference. Restoring data files can be accomplished by file name, a particular version of a file, all versions of a file, or all files.

MACHINES

Physical Specifications:

External Drive (A01, A11, and B01).

Width: 226mm (8.7 in.)
Depth: 422mm (16.6 in.)
Height: 138mm (5.45 in.)
Weight: 6.75kg (14.875 pounds)

Operating Environment:

3363 Drive:

Temperature: +15.6 to 32.6 degrees C max (60 to 90 degrees F max)
Relative Humidity: 8 to 80 percent
Wet Bulb: +23.8 degrees C (74.8 degrees F max)

3363 Optical Disk Cartridge:

Temperature: +10.0 to 51.6 degrees C max (50 to 125 degrees F max)
Relative Humidity: 8 to 80 percent
Wet Bulb: +29.4 degrees C (84.9 degrees F max)

IBM 3363 Optical Disk Cartridge (P/N 63X4199)

3370 DIRECT ACCESS STORAGE

PURPOSE

High-speed, large-capacity, fixed-media, direct access storage for attachment to a 4331, 4341, 4361, 4381, 9375 or 9377 Processor, the 3092 Processor Controller or System/38 5381 System Unit.

MODELS

Model A1 A01: (NO LONGER AVAILABLE) Single drive disk storage with two actuators and associated control for attachment to the 4331, 4341, 4361 or 4381 Processors. It provides logic for the attachment of up to three 3370 mdl B1 units on the and 4331, and for the attachment of up to three model B1 and/or B2 units intermixed in any combination to the 4331 (model groups 11 and 2), 4341, 4361, 4381, 9375 or 9377 Processors.

Model A2 A02: Single drive disk storage with two actuators and associated control for attachment to 4331 (model groups 11 and 2), 4341, 4361, 4381, 9375 and 9377 Processors and the 3092 Processor Controller. The mdl A2 provides logic for attachment of up to three 3370 mdl B1 or B2 units inter-mixed in any combination.

Model B1 B01: (NO LONGER AVAILABLE) Single drive disk storage with two actuators. Up to three 3370 model B1 units may be attached to a 3370 mdl A1 or mdl A2.

Model B2 B02: Single drive disk storage with two actuators. Up to three 3370 mdl B2 units may be attached to a 3370 mdl A1, when attached to a 4331 (model groups 11 and 2), 4341, 4361, 4381, 9375 or 9377; or 3370 mdl A2.

Model A11 A11: (NO LONGER AVAILABLE) Single drive disk storage with two actuators and associated control for attachment to System/38 5381 System Unit (mdls 4, 5, 6, 7 and 8 only) with a 3370 Attachment Adapter. The mdl A11 provides logic and power for the attachment of up to three 3370 mdl B11 units or B12 units intermixed in any combination.

Model A12 A12: Single drive disk storage with two actuators and associated control for attachment to System/38 5381 System Unit (mdls 4, 5, 6, 7, and 8) with a 3370 attachment adapter. The mdl A12 provides logic and power for the attachment of up to three 3370 mdl B11 or B12 units intermixed in any combination.

Model B11 B11: (NO LONGER AVAILABLE) Single drive disk storage with two actuators. Up to three 3370 mdl B11 units may be attached to a 3370 mdl A11 or A12.

Model B12 B12: Single drive disk storage with two actuators. Up to three 3370 mdl B12 units may be attached to a 3370 mdl A11 or A12.

Maximum Configuration: See M3880, 4331, 4341, 4361, 4381, 9370 or System/38 5381 pages.

Prerequisites: A 3370 mdl B1 or B2 requires a 3370 mdl A1 or A2, and a 3370 mdl B11 or B12 requires a 3370 mdl A11 or A12.

For a 4331 Processor Mdl Group 1 -- a 3370 mdl A1 requires a DASD Adapter (#3201) on the 4331.

For a 4331 Processor Mdl Group 2 or 4361 Processor -- a 3370 mdl A1/A2 requires a DASD Adapter (#3201 or #3202) on the 4331 or 4361, or a 3880 Storage Control mdl 1, 2 or 4 attached to the High-Speed Block Multiplexer Channel (#143X) on the 4331 or 4361.

For a 4331 Processor Mdl Group 11 -- a 3370 mdl A1/A2 attaches via a DASD Adapter which is standard on the 4331 Mdl Group 11.

For a 4361 -- a 3370 mdl A1 or A2 requires a DASD/8809 Adapter on the 4361, or a 3880 Storage Control mdl 1, 2 or 4 attached to a High-Speed Block Multiplexer Channel on the 4361.

For a 4341 or 4381 Processor -- a 3370 mdl A1 or A2 requires a 3880 Storage Control mdl 1, 2 or 4 connected to a 2.0 megabyte block multiplexer channel on the 4341 or 4381.

For a System/38 -- a 3370 mdl A11 or A12 requires attachment feature #1130 on the 5381 System Unit (mdls 4, 5, 6, 7, and 8), and a second 3370 mdl A11 or A12 on the 5381 System Unit mdl 8 requires attachment feature #1132. A specify code is also required on the 5381 System Unit to designate the 3370 units to be attached. For a 9375 or 9377 the 3370 model A1 or A2 requires a 3880 Storage Control model 1, 2 or 4. See M9370 pages.

A cable order is required for each A mdl ordered.

HIGHLIGHTS

The 3370 features high data rate, fast access, fixed block format, and low cost per byte. It employs a fixed, sealed Head/Disk Assembly (HDA) as the storage medium. The HDA is a field replaceable unit. Two access arms per spindle, each separately addressable with overlapped operation -- locate-locate/read/write. Each arm accesses one-half the data. Reduced power and space requirements. Fixed block architecture allows the specification of DASD space in groups of blocks, making space definition independent of tracks and cylinders.

	Mdl Series	
Fixed Block Format	01/11	02/12
Data bytes per block	512	512
Blocks per actuator	558,000	712,752
Megabytes per actuator	285.6	364.9
Megabytes per spindle	571.3	729.8

Blocks are separately addressable and jointly form a contiguous address space.

	Mdl Series	
Performance Factors	01/11	02/12
Ave. Seek (arm motion)	20ms	19ms
Latency	10.1ms	10.1ms
Data Rate (+ or - 3%)	1.859MB/sec.	1.859MB/sec.

Error Correction: Error detection codes correct error bursts occurring in nine bits or less, and detect errors that span three bytes or less.

Automatic Position Sensing: Fixed Block Architecture provides for relative block addressing, each block separately addressable. When attached to the 4331, 4341, 4361, or 4381 Processor, the channel automatically disconnects during period of rotational latency providing greater channel availability. Requires one unshared subchannel on a 4331, 4341, 4361 or 4381 block multiplexer channel for each logical address.

Command Retry: (Not available with the System/38) Enables the storage control to recover from certain subsystem errors without recourse to system error recovery procedures.

Write Protect Function: A switch is provided for each Drive Address to select a Write Protect function. On the 3370 mdls A01, B01, A02, B02, this function provides the means to protect data from being rewritten or erased. When the read/write switch is in the read-only position, any write command is rejected. The switch state can be changed only when the device is not selected. On the 3370 mdls

A11, B11, A12, B12 (System/38), when a write operation is called for with the switch in the read-only position, the 3370 Direct Access Storage system will halt with an operator prompt to return the switch to its read/write position.

HDA Data Recovery: (Plant only) Should data in the field prove unrecoverable, data recovery assistance at the plant of manufacture will be provided. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning the head and disk assembly to the plant for data recovery.

Bibliography: GA26-1657.

- **Color:** The color for the base enclosure is pearl white. For accent panel color (mdls A1, A2, A11 and A12) specify #9060 willow green, #9061 garnet rose, 9062 sunrise yellow, 9063 classic blue, #9064 charcoal brown, #9065 pebble gray, #9066 pearl white.

- **Machine Nomenclature:**

Canadian	Japanese	#2930
English	#2934	Portuguese
Canadian		(Brazil) #2933
French	#2935	Spanish
English US	#2924	

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- **System Attachment:** If 3370-A2 is to be plant-merged with a 3090 Processor, specify #9491.
- **Power (AC, 3-phase):**

50 Hz 5-wire	60 Hz 4-wire
#2807 200V	#2733 200V
#2815 220V	#9903 208V
#2816 380V	#2800 220V
#2825 400V	#9915 240V**
#2826 415V*	

* For System/38 5381 System Unit with 235V or 408V, specify #2826.

** For System/38 5381 System Unit with 230V, specify #9915.

SPECIAL FEATURES

- | **String Switch (#8150):** (Mdl A1, A2) To attach the 3370 to a second Storage Director or DASD Adapter. The two Storage Directors may be on the same processor or different processors. Switching between the two Storage Directors or DASD Adapter is under program control. The 3370 may also be dedicated to a single attachment with an enable/disable switch. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

- | Model conversions are offered through RQs.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3375 DIRECT ACCESS STORAGE

PURPOSE

High-speed, large-capacity, direct access disk storage for attachment to a 145, 148, 155-II, 158, 165-II, 168 or 3031, 3032, 3033, 3042 Attached Processor Model 2, 3081, 3083, 3084, 3090, 4341, 4331 Mdl Group 2, 4361, 4381, 9375, 9377 Processor.

MODELS

Model A1: A disk storage unit with one head and disk assembly (HDA), two actuators and associated control for attachment to a 3880 Storage Control model 1 or 2. It provides logic and power for attachment of up to three 3375 model B1 units.

Model B1: A disk storage unit with one HDA and two actuators. Up to three 3375 mdl B1s can be attached to a 3375 mdl A1.

Model D1: A disk storage unit with one HDA, two actuators, and associated control. In a 3375 string, the model D1 provides a dual controller function with a second data path to each HDA. It may be attached to the same system as the model A1, or to a different system. A 3375 string containing a model D1 requires model A1 and two B1 units.

Limitations: 3375 units may attach only to 3880 Storage Control mdls 1, 2, or 4. For systems attachment, see M3031, 3032, 3033, 3081, 3083, 3084, 4300, 9370 pages.

The mdl A1 and mdl D1 in the same string cannot be attached to the same storage director on the 3880, nor through the same channel on the processor.

Maximum: Up to three 3375 mdl B1 storage units may be attached to one 3375 mdl A1. In a dual controller string, two mdl B1 storage units and one 3375 mdl D1 storage unit may be attached to one mdl A1. Up to four mdl A1 or mdl D1 storage units may be attached to a 3880 storage director for a maximum of 32 addresses (actuators).

Prerequisites: A 3375 mdl A1 is required to attach 3375 mdl B1s. A 3880 Storage Control mdl 1, 2, or 4 required to attach a 3375 to a processor. Attachment of 3880 to a 4341, 4331 Mdl Group 2, 4361 or 4381 processor requires a block multiplexer channel with a data rate of at least 1.86MB. Attachment to 3031, 3032 or 3033 Processors or to a 3042 Attached Processor mdl 2 requires Data Streaming (#4850) installed on processor channel groups or Speed Matching Buffer feature (#6560) installed on the 3880. Attachment to a 3081, 3083, 3084 or 3090 processor is via any block multiplexer channel. Attachment to 145, 148, 155-II, 158, 165-II or 168 Processors require a Speed Matching Buffer (#6560) installed on the 3880. The Speed Matching Buffer feature (#6560) is not supported for attachment to a 3090 Processor. Attachment to 9375 or 9377 requires (#6003). See M9370 pages.

A 3375 string containing a mdl D1 requires a mdl A1 and two mdl B1s. Each mdl A1 and B1 must have a mdl D1 attachment feature installed.

Write Protect Function: A switch for each drive address provides the means to protect data from being rewritten or erased. When the read/write switches in the read-only position, any write command is rejected. The switch state can be changed only when the device is not selected.

HIGHLIGHTS

The 3375 features high data rate, fast access and low cost per byte of storage. Each 3375 unit contains one 819.7MB sealed and permanently mounted head and disk assembly. There are two actuators per HDA, each is separately addressable and accesses one-half of the HDA storage (409.8MB). Each seeking and rotational position sensing of any actuator can be overlapped with seeking, rotational position sensing, and data transfer of the other actuators.

With a mdl D1 installed, a data transfer operation from an actuator in any unit in the string may be overlapped with another data transfer operation from an actuator in any other unit in the string.

Characteristics:

General -			
Actuators per HDA	2		
HDAs per unit	1		
Capacity -			
per actuator	409.8	MB	
per HDA	819.7	MB	
per max string	3.27	GB	
Access Time -			
Average seek (actuator motion)	19	ms	
Average latency	10.1	ms	
Data Rate -	1.859	MB/sec.	

Data Format: Count-key-data.

• **Error Correction:** Capability is provided to correct as well as detect single data error bursts of up to sixteen bits if the burst spans no more than two contiguous bytes.

• **Rotational Position Sensing:** Permits channel and storage director disconnect during period of rotational latency, thereby providing for improved channel utilization and system performance potential -- requires one unshared subchannel on a block multiplexer channel for each logical device address (each actuator).

• **Head and Disk Assembly Data Recovery (plant only):** Should data in the field prove unrecoverable, data recovery assistance will be provided at the plant of manufacture. Branch Office Customer Engineering will initiate the recovery procedure. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning the head and disk assembly to the plant for data recovery.

• **Flag Free:** The 3375 will be shipped Flag Free.

Publications: GC20-0001

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

Power (AC, 3-phase):

50 Hz (5-wire)	60 Hz (4-wire)
200V #2807	200V #2733
220V #2815	208V #9903
230V #2827	220V #2800
240V #2818	240V #9915
380V #2816	
400V #2825	
415V #2826	

• **Color:** (Mdl A1) #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.

SPECIAL FEATURES

Mdl D1 Attachment For Mdl A1 (#4951): This feature must be included on all mdl A1 boxes that are installed in a string that includes a mdl D1. Field installation: Yes.

MACHINES

Note: A mdl A1 with this feature installed will not operate in a string without a mdl D1.

Mdl D1 Attachment Feature For Mdl B1 (#4952): This feature must be included on all mdl B1 boxes that are installed in a string that includes a mdl D1. Field Installation: Yes.

Note: A mdl B1 with this feature installed will not operate in a string without a mdl D1.

String Switch (#8150): (Mdls A1, D1) For use with 3880 Storage Controls mdls 1, 2 or 4 only. #8150 is used to attach the 3375 mdl A1 or mdl D1 to a second storage director. The two storage directors may be on the same processor or different processors. Switching between the two storage directors is under program control. The 3375 may also be dedicated to a single attachment through

enable/disable switches. Maximum: One each on mdl A1 and mdl D1. Field Installation: Yes.

MODEL CONVERSIONS

Model changes between models A1 and B1 or between models A1 and D1 are available at time of manufacture only. A model change from a B1 to a D1 is permitted in the field. A model change from a D1 to a B1 is not recommended for field installation.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3380 DIRECT ACCESS STORAGE

THERE IS MORE THAN ONE TEXT VERSION FOR THIS PRODUCT

PURPOSE

High-speed, large-capacity, direct access disk storage for attachment to 4341, 4361, 4381, 3031, 3032, 3033, 3081, 3083, 3084, 3090, 9375, 9377 Processors, 3042 Attached Processor Model 2. The 3380 Models A04, AA4 and B04 also attach to S/370 Models 158, 158-3, 168, and 168-3.

MODELS

Model A4 A04 (NO LONGER AVAILABLE): A disk storage unit with two head and disk assemblies (HDAs), four actuators and associated control for attachment to a 3880 Model 2 or 3 storage director. It provides logic and power for attachment of up to three 3380 Model B04 units. The maximum storage capacity is 2.52 billion bytes.

Model AA4 AA4 (NO LONGER AVAILABLE): A disk storage unit with two HDAs, four actuators and associated controls for attachment to two 3880 Model 2, 3, 13 or 23 storage directors, or two 3990 Model 1, 2, or 3 storage paths. Model AA4/B04 actuators are arranged on multiple internal paths within a string, with up to four actuators sharing a path. Dynamic path selection controls access to the actuators. It provides access by both storage directors to all actuators in a Model AA4/B04 string and enables concurrent data transfer operations, via each storage director, to actuators not sharing an internal data path. The logic and power are provided for attachment of up to three 3380 Model B04 units. The maximum storage capacity of this Model is 2.52 billion bytes.

Model B4 B04 (NO LONGER AVAILABLE): A disk storage unit with two HDAs and four actuators. Up to three 3380 Model B04s can be attached to a 3380 Model A04 or AA4. The maximum storage capacity of this model is 2.52 billion bytes.

Model AD4 AD4: A disk unit with two HDAs, four actuators and associated controls for attachment to two 3990 Model 1, 2, or 3 storage paths or two 3880 Model 3 or 23 storage directors. Device Level Selection (DLS) permits concurrent data transfer from any two actuators within the unit or associated string including those of the same HDA. Logic and power are provided for attachment of up to three 3380 Model BD4/BE4 units intermixed in any sequence or combination. The maximum storage capacity of the Model AD4 is 2.52 billion bytes. The Model AD4 can be upgraded in the field to a Model AE4.

Model BD4 BD4: A disk unit with two HDAs and four actuators. The Model BD4 can be connected to either an AD4, an AE4, a BE4 or another BD4. The maximum storage capacity of the Model BD4 is 2.52 billion bytes. The Model BD4 can be upgraded in the field to a Model BE4.

Model AE4 AE4: A disk unit with two HDAs, four actuators and associated controls for attachment to two 3990 Model 1, 2, or 3 storage paths or two 3880 Model 3 or 23 storage directors. Device Level Selection (DLS) permits concurrent data transfer from any two actuators within the unit or associated string including those of the same HDA. Logic and power are provided for attachment of up to three 3380 Model BE4/BD4 units intermixed in any sequence or combination. The maximum storage capacity of the Model AE4 is 5.04 billion bytes.

Model BE4 BE4: A disk unit with two HDAs and four actuators. The Model BE4 can be connected to either an AE4, an AD4, a BD4 or another BE4. The maximum storage capacity of the Model BE4 is 5.04 billion bytes.

Model AJ4: A disk storage unit with two HDAs, four actuators and associated controls for attachment to two 3990 Model 1, 2, or 3 stor-

age paths, or two 3880 Model 3 or 23 storage directors. The maximum storage capacity of the Model AJ4 is 2.52 billion bytes. The Model AJ4 can be upgraded in the field to a Model AK4.

Two interconnected 3380 Model AJ4s, or AK4s, or one AJ4 and one AK4, attach to a 3990 Model 2 or 3 in Device Level Selection Enhanced (DLSE) mode with feature #9433 on each A-unit. DLSE permits concurrent data transfer from any FOUR actuators within the unit or associated string, including those of the same HDA. Logic and power are provided for attachment of up to six 3380 Model BJ4/BK4 units intermixed in any sequence or combination, where three B-units are attached to each A-unit in the string.

The 3380 Model AJ4, with feature #9432, attaches to 3990 Model 1, 2, or 3 in Device Level Selection (DLS) mode. DLS permits concurrent data transfer from any TWO actuators within the unit or associated string, including those of the same HDA. Logic and power are provided for attachment of up to three 3380 Model BJ4/BK4 units intermixed in any sequence or combination. The Model AJ4, with feature #9431, attaches to two 3880 Model 3 or 23 storage directors with feature #3005 on the Model 3, or feature #3010 on the Model 23. Logic and power are provided for attachment of up to three 3380 Model BJ4/BK4 units intermixed in any sequence or combination.

Model BJ4: A disk storage unit with two HDAs and four actuators. The Model BJ4 can be connected to either an AJ4, an AK4, a CJ2, a BK4, or another BJ4. The maximum storage capacity of the Model BJ4 is 2.52 billion bytes. The Model BJ4 can be upgraded in the field to a Model BK4.

Model AK4: A disk storage unit with two HDAs, four actuators and associated controls for attachment to two 3990 Model 1, 2, or 3 storage paths, or two 3880 Model 3 or 23 storage directors. The maximum storage capacity of the Model AK4 is 7.56 billion bytes.

Two interconnected 3380 Model AK4s, or AJ4s, or one AK4 and one AJ4, attach to a 3990 Model 2 or 3 in Device Level Selection Enhanced (DLSE) mode with feature #9433 on each A-unit. DLSE permits concurrent data transfer from any FOUR actuators within the unit or associated string, including those of the same HDA. Logic and power are provided for attachment of up to six 3380 Model BK4/BJ4 units intermixed in any sequence or combination, where three B-units are attached to each A-unit in the string.

The 3380 Model AK4, with feature #9432, attaches to 3990 Model 1, 2, or 3 in Device Level Selection (DLS) mode. DLS permits concurrent data transfer from any TWO actuators within the unit or associated string, including those of the same HDA. Logic and power are provided for attachment of up to three 3380 Model BK4/BJ4 units intermixed in any sequence or combination. The Model AK4, with feature #9431, attaches to a 3880 Model 3 or 23 with feature #3005 on the 3880 Model 3, or feature #3010 on the 3880 Model 23. Logic and power are provided for attachment of up to three 3380 Model BK4/BJ4 units intermixed in any sequence or combination.

Model BK4: A disk storage unit with two HDAs and four actuators. The Model BK4 can be connected to either an AK4, an AJ4, a CJ2, a BJ4 or another BK4. The maximum storage capacity of the Model BK4 is 7.56 billion bytes.

Prerequisites:

Models A04, AA4, B04: A 3380 Model A04 requires a 3880 Storage Control Model 2 or 3 to attach to a block multiplexer channel; a 3380 Model A04 requires one storage director in a 3880 Model 2 or 3.

A 3880 Storage Control Model 2, 3, 13, or 23 or a 3990 Storage Control Model 1, 2, or 3 is required to attach a 3380 Model AA4 to a block multiplexer channel. A 3380 Model AA4 requires two storage paths within the same 3990 Model 1, 2, or 3, or within dual-framed 3990 Model 2s or 3s, or two storage directors that can be within the same or different 3880 Model 2s or 3s. When attached to a 3880 Model 13 or 23, see other limitations described in the M3880 pages. To obtain updated installation and maintenance information for attaching a Model AA4 to a 3990, feature #9003 is required on the 3990.

Models AD4, BD4, AE4, BE4: A 3990 Model 1, 2, or 3 Storage Control or a 3880 Model 3 or 23 Storage Control is required to attach a 3380 Model AD4 or AE4 to a block multiplexer channel. A 3380 Model AD4 or AE4 requires two storage paths within the same 3990 Model 1, 2, or 3 or within dual-framed 3990 Model 2s or 3s, or two storage directors that can be within the same or different 3880 Model 3s or 23s. When attached to a 3880 Model 3 or 23, see limitations as described in the M3880 pages.

3990 Models 1, 2, and 3 are equipped to attach 3380 Models AD4 and AE4; feature #9052 (updated maintenance and installation information) is required on the 3380 Model AD4 or AE4.

Models AJ4, BJ4, AK4, BK4: A 3990 Model 1, 2, or 3 Storage Control or a 3880 Model 3 or 23 Storage Control is required to attach a 3380 Model AJ4 or AK4 to a block multiplexer channel. A 3380 Model AJ4 or AK4 requires two storage paths within the same 3990 Model 1, 2, or 3 in DLS support mode with feature #9432 on the 3380 AJ4 or AK4 (2-path strings). Two 3380 Model AJ4s, AK4s, or an AJ4 and an AK4 can be interconnected to share four storage paths within the same 3990 Model 2 or 3 in DLSE support mode with feature #9433 on each of the two A-units (4-path strings).

A 3380 Model AJ4 or AK4 requires two storage directors that can be within the same or different 3880 Model 3s or 23s. Attachment of 3380 Models AJ4 or AK4 to a 3880 Model 3 or 23 requires feature #9431 on the DASD, and feature #3005 and two #9050s on the 3880 Model 3, or feature #3010 and two #9055s on the 3880 Model 23. See other limitations as described in the M3880-3 and M3880-23 pages.

For all models, see limitations and processor attachment sections of these sales pages.

Maximum: 3380 string length varies depending on the models and the storage control to which the string is attached. A 3380 Model A04, AA4, AD4 or AE4 string is always comprised of one A-unit and zero to three B-units. A 3380 Model AJ4 or AK4 2-path string is comprised of one A-unit and zero to three Model BJ4 and/or BK4 units. A 3380 Model AJ4 or AK4 4-path string is comprised of two Model AJ4 and/or AK4 units in any combination and zero to six Model BJ4 and/or BK4 units in any combination, and requires attachment to a 3990 Model 2 or 3 in DLSE support mode.

Two 3380 Model AA4, AD4, AE4, AJ4 or AK4 2-path strings, in any combination, can be attached to one 3880 or one 3990 Model 1 Storage Control, allowing up to eight 3380 units per storage control. A 3990 Model 2 or 3 can attach up to four 3380 Model AA4, AD4, AE4, AJ4, or AK4 2-path strings in any combination, or up to two AA4, AD4 or AE4 strings and one 4-path AJ4 and/or AK4 string, or up to two 4-path AJ4 and/or AK4 strings, allowing up to 16 3380 units per storage control.

Strings headed by 3380 Models AA4, AD4 and AE4 can be paired in any combination on a 3880. Strings headed by Models AD4, AE4, AJ4 and AK4 can be paired in any combination on a 3880 Model 3 or 23. Strings headed by Models AA4, AD4, AE4, AJ4 and AK4 can be paired in any combination on a 3990 Model 1, 2, or 3.

Limitations

1. B-Unit Attachment:

- A string headed by either a Model A04 or a Model AA4 can only attach Model B04 units.
- A string headed by either a Model AD4 or AE4 can only attach either Model BD4 and/or Model BE4 units.
- A string headed by either a Model AJ4 or AK4 can only attach either Model BJ4 and/or Model BK4 units.

2. Pairing Strings:

- A Model AJ4 or AK4 2-path string attached to a 3990 Model 2 or 3 cannot be paired with a Model AJ4/AK4 4-path string.

3. Storage Control Attachment:

- Model A04 cannot be attached to the same storage directors as the Models AA4, AD4, AE4, AJ4 and AK4.
- A Model AA4 with serial numbers 97-00001 through 97-00686 cannot attach to a 3990.

- The Speed Matching Buffer feature (#6550) on the 3880 cannot be used with the 3380 Models AD4, BD4, AE4, BE4, AJ4, BJ4, AK4, and BK4.
- The Speed Matching Buffer feature (#6550) on the 3880 is not supported for attachment to a 3090 Processor.
- A 3380 Model A04 or AA4 cannot attach to a 3880 Model 3 which has feature #3005 (3380 AJ4/AK4 Support) or to a 3880 Model 23 which has feature #3010 (3380 AJ4/AK4 Support).
- If a 3880 Model 3 with feature #3005 is cross-connected to another 3880 Model 3, then both 3880s must have feature #3005 installed.
- If a 3880 Model 23 with feature #3010 is cross-connected to another 3880 Model 23, then both 3880s must have feature #3010 installed.

4. Specify Features:

- Attachment of 3380 Models AD4 and AE4 to a 3880 Model 3 requires feature #8173 (AD4/AE4 Support) and two #9208 (Extended Specify) features on the 3880, except when feature #3005 is installed.
- Feature #8173 (AD4/AE4 Support) cannot be installed on 3880 Model 3s concurrent with the Speed Matching Buffer for 3880 feature (#6550).
- See table below for 3880 Model 3 serial number limitations for feature #8173.
- All 3880 Model 23s are equipped to attach 3380 Models AD4 and AE4.
- Attachment of 3380 Models AJ4 and AK4 to a 3880 Model 3 requires feature #3005 (3380 AJ4/AK4 Support) and two #9050 features on the 3880.
- 3880 Model 3s with feature #8173 (AD4/AE4 Support) or feature #6550 (Speed Matching Buffer) must have those features removed before feature #3005 can be installed.
- Attachment of 3380 Models AJ4 and AK4 to a 3880 Model 23 requires feature #3010 (3380 AJ4/AK4 Support) and two #9055 features on the 3880.
- See table below for 3880 Model 3 serial number limitations for feature #3005.
- Feature #3010 (3380 AJ4/AK4 Support) cannot be installed on 3880 Model 23s that have the Record Cache RPQ #8B0035.

Table - 3380 Model 3 Serial Number Limitations for Attachment of 3380 Models AD4, AE4, AJ4, and AK4:

CANNOT ADD	CAN ADD #8173
#8173 OR	OR #3005 IF
#3005	HAVE RPQ MM2865

HIGHLIGHTS

The 3380 features high data rate, fast access and low cost per byte of storage. Each 3380 unit contains two permanently mounted head and disk assemblies (HDAs). There are two actuators per HDA -- each accessing one-half of the HDA storage and each separately addressable. Seeking and rotational position sensing of any actuator can be overlapped with seeking, rotational position sensing, and data transfer of the other actuators.

Model AA4, AD4, AE4, AJ4, and AK4 enable attachment of a 3380 string to a second storage director with dynamic path selection controlling access to the actuators, providing access via both storage directors to all data and storage control status in a string. In strings headed by either Models AD4, AE4, AJ4, or AK4 the efficiency of data access is improved by the function of Device Level Selection (DLS), allowing any two actuators in the string to read or

write data simultaneously. Four-path string capability is introduced with the Device Level Selection Enhanced (DLSE) function of the Models AJ4, BJ4, AK4, and BK4, which extends the efficiency of data access by allowing any four actuators in the string to read or write data simultaneously.

CHARACTERISTICS:

Note: See individual processor, M3880, M3990, and these sales pages for serial number limitations and additional information.

Data Format: Count-key-data provides format continuity with current IBM large systems direct access storage products.

Dynamic Path Selection: Incorporated in Models AA4, AD4, AE4, AJ4 and AK4 which attach to two 3880 storage directors. Dynamic path selection controls access to the actuators, providing paths via two controllers in the head of string from both storage directors to all actuators in a 3380 string. Introduced with the 3380 Model AA4. DPS allows concurrent data transfer operations to actuators on different internal data paths in a 3380 AA4 string. When Dynamic Path Selection is used with the 370-XA channel subsystem, the 3380 can dynamically reconnect to the first available channel path identified by the originating processor. This has the potential of increasing effective throughput and/or improving response time.

Device Level Selection: Device Level Selection (DLS), announced with the 3380 Models AD4, BD4, AE4, and BE4, enhanced the DPS functions by providing two independent data paths to each device in a 2-path string, including those of the same HDA. DLS is also available with the 3380 Models AJ4, BJ4, AK4, BK4, and CJ2. A 2-path string has a maximum of 16 device addresses (four DASD units), with the exception of a 3380 CJ2 string, which has a maximum of 14 device addresses.

Device Level Selection Enhanced: Device Level Selection Enhanced (DLSE), announced with the 3380 Models AJ4, BJ4, AK4, and BK4, improves upon the DLS functions by providing four independent data paths to each device in the 3380 4-path string. When two 3380 Models AJ4 and/or AK4 are attached to a 3990 Model 2 or 3 in DLSE support mode, each of the four controllers (provided by interconnecting the two A-units) has a path to all devices in the string, and any four devices in the 4-path string can read or write data simultaneously. A 4-path string has a maximum of 32 device addresses (eight DASD units).

Error Correction: Capability is provided to correct single data error bursts in 3380 Models A04, AA4, B04, AD4, BD4, AE4, and BE4, and multiple error bursts in 3380 Models AJ4, BJ4, AK4, and BK4.

Rotational Position Sensing: Permits channel and storage director disconnect during period of rotational latency, thereby providing for improved channel utilization and system performance potential. Requires one unshared subchannel on a block multiplexer channel for each logical device address (each actuator).

Format Write Release: Enables channel and storage director to disconnect while the remainder of a track is being erased following the end of a format written record.

Separate Actuator Maintenance: Enables the associated logic and controls of each actuator to be serviced independent of and concurrent with customer operation of the other actuators within the same HDA and string.

Nondisruptive Install: Allows installation of BJ4/BK4 units to an existing 4-path AJ4/AK4 string, as well as the installation of a second 4-path AJ4/AK4 string, without the loss of data availability to an existing string.

Head and Disk Assembly Data Recovery: (Plant only) Should data in the field prove unrecoverable, data recovery assistance will be provided at the plant of manufacture. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning Head and Disk assembly to the plant for data recovery.

Flag Free: The 3380 will be shipped with all tracks flag free.

Publications: The following manuals are part of the Storage Subsystems Library (SSL).

3380 DIRECT ACCESS STORAGE - MODEL CJ2

PURPOSE

High-speed, large capacity, direct access disk storage with integrated storage controls for direct attachment to 4381, 3081, 3083, 3084, 3090, 9375 and 9377 Processors.

MODEL

Model CJ2: A disk unit with one HDA with two actuators, and two storage control paths for direct attachment to 3Mb/sec. block multiplexer channels of the 4381, 3081, 3083, 3084, 3090, 9375 and 9377 processors. The storage capacity of the HDA is 1.26Gb. Logic and power are provided for attachment of up to three 3380 Model BJ4/BK4 units intermixed in any sequence or combination. The maximum CJ2 string capacity is 23.9 billion bytes of storage.

Prerequisites: The 3380 Model CJ2 requires a 3Mb/sec. block multiplexer channel for attachment of each of its two Storage Control paths to a supported processor. Attachment of both interfaces to two channels of the same processor assures data availability; attachment to one channel on each of two processors provides data sharing without storage path redundancy.

Limitations: Each channel interface of the two provided on the IBM 3380 Model CJ2 can be attached to only one 3Mb/sec. block multiplexer channel. When sharing a processor channel with other storage controls, the Model CJ2 must follow any storage control that is operating at rates greater than 3Mb/sec.

HIGHLIGHTS

Characteristics

General

Actuators per HDA	2
HDAs per unit	1

Capacities

per actuator	630Mb
per HDA	1.26Gb
per unit	1.26Gb
per max string	23.9Gb

Access Times

Average seek (actuator motion)	12ms
Average latency	8.3ms
Data Rate (Mb/sec.)	3.0

Processor Attachment: The 3380 Model CJ2 attaches directly to 4381, 3081, 3083, 3084, 3090, 9375 and 9377 Processors via 3Mb/sec. block multiplexer channels.

Data Format: Count-key-data provides format continuity with current IBM large systems direct access storage products.

Device Level Selection: Device Level Selection (DLS), provides two independent data paths to each device in a 2-path string, including those of the same HDA, supporting concurrent data transfer over these two paths.

Maximum: A 3380 CJ2 string has a maximum of 14 device addresses.

Error Correction: Capability is provided to correct multiple data error bursts in the 3380 Model CJ2.

Rotational Position Sensing: Permits channel and storage director disconnect during period of rotational latency, thereby providing for improved channel utilization and system performance potential.

Requires one unshared subchannel on a block multiplexer channel for each logical device address (each actuator).

Format Write Release: Enables channel and storage director to disconnect while the remainder of a track is being erased following the end of a format written record.

Separate Actuator Maintenance: Enables the associated logic and controls of each actuator to be serviced independent of and concurrent with customer operation of the other actuators within the same HDA and string.

Head and Disk Assembly Data Recovery: (Plant only) Should data in the field prove unrecoverable, data recovery assistance will be provided at the plant of manufacture. The customer is required to provide a sufficient number of appropriate media (tapes, disk modules, etc.) to contain recovered data when returning Head and Disk Assembly to the plant for data recovery.

Flag Free: The 3380 Model CJ2 will be shipped with all tracks flag free.

Publications: The following publications will be available immediately. To order, contact your IBM representative.

SPECIAL FEATURES (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

3410 MAGNETIC TAPE UNIT 3411 MAGNETIC TAPE UNIT and CONTROL

PURPOSE

Magnetic tape units and controls for a System/3 models 8/10/12/15, System/38 or 3790 Communication System, S/370 models 115 through 158, a 3031 Processor, or a 4331, 4341 or 4361 Processor ... the 3410 model 1 can be used with a 3881 Optical Mark Reader model 2 or a 3886 Optical Character Reader model 2 ... the 3411 and 3410 model 3s can be used with a 3800 Printing Subsystem ... the 3411 model 1 can be used with a 3776 Communication Terminal model 3 or 4, or a 3777 Communication Terminal model 3 or 4.

MODELS

Model 1	001	20,000 8-bit bytes per second (1600 bpi)
Model 2	002	40,000 8-bit bytes per second (1600 bpi)
Model 3	003	80,000 8-bit bytes per second (1600 bpi)

Maximums: Interconnected 3410s and 3411s must be of the same mdl ... mdls cannot be intermixed. The maximum number of tape units (3410s) per 3411 are:

- Mdl 1 - up to three 3410 mdl 1s ... a total of 4 drives.*
- Mdl 2 - up to five 3410 mdl 2s ... a total of 6 drives.*
- Mdl 3 - up to five 3410 mdl 3s ... a total of 6 drives.*

* For System/3 mdls 8/10/12/15 or S/38: Maximums for mdls 2 and 3 are the same as mdl1.

Limitations: A maximum of one 3410 mdl 1 can be attached to a 3881 or 3886; no 3411 is required. A maximum of 4 tape drives (any mdl) can be attached to a System/3 mdl 8/10/12/15 or System/38.

Prerequisites: Each 3411 requires the following:

For System/3 mdl 10/15: A 3411 Magnetic Tape attachment (#7951) on the 5410 or 5415 and System/3 mdl 8/10/12/15, System/38 Attachment (#7003) on the 3411... see "Special Features".

For System/3 mdl 8: A 3411 Magnetic Tape Attachment (#7960) on the 5408 and System/3 mdl 8/10/12/15, System/38 Attachment (#7003) on the 3411... see "Special Features".

For System/3 mdl 12: A Basic Attachment Feature (#4701) and a 3411 Magnetic Tape Attachment (#7960) on the 5412 and System/3 mdl 8/10/12/15, System/38 attachment (#7003) on the 3411 ... see "Special Features".

For System/38: A 3411 Magnetic Tape Adapter (#7960) on the System/38 and System/3 mdl 8/10/12/15, System/38 attachment (#7003) on the 3411 ... see "Special Features". Each 3410 requires and appropriate model of the 3411, except when a 3410 mdl 1 is attached to a 3881 or 3886.

For S/370 mdl 115, 125: A 3411 Magnetic Tape Adapter (#4675) on the 3115 or 3125 and S/370 mdl 115/125 Attachment (#7361) on the 3411 except with 3115 mdl HG2, 3125 mdl HG2 and I2. When attached to 3115 mdl HG2, or 3125 mdl HG2 or I2, RPQ 870061 is required on the 3411 ... see "Special Features".

For S/370 mdl 135 and up, and all 4300 processors: A control unit position on a system channel, plus S/370 Attachment (#7360) on the 3411 ... see "Special Features".

S/370 mdl 135: Multiplexer channel (standard), selector or block multiplexer channels (special features) ... see M3135 pages. *NOT* supported on byte multiplexer channel for concurrent operation with Integrated File Adapter, Integrated Communications Adapter or Selector Channel.

S/370 mdl 135-3: Byte multiplexer channel (standard), block multiplexer channels (special features) ... see M3135-3 pages. *NOT* supported on byte multiplexer channel for concurrent operation of Integrated File Adapter, Integrated Communications Adapter or Block Multiplexer Channel.

S/370 mdl 138: Byte multiplexer channel (standard), block multiplexer channels (standard) ... see M3138 pages. *NOT* supported on byte multiplexer channel for concurrent operation of Integrated File Adapter, Integrated Communications Adapter, or Block Multiplexer Channel.

S/370 mdl 145: Multiplexer channel (standard), selector channels (one is standard), or block multiplexer channel (special feature) ... see M3145 pages.

S/370 mdl 145-3: Byte multiplexer channel (standard), block multiplexer channels ... see M3145-3 pages.

S/370 mdl 148: Byte multiplexer channel (standard), block multiplexer channels (standard) ... see M3148 pages.

S/370 mdl 155, 158: Block multiplexer channel (first two are standard) ... see M3155, 3158 pages.

3031 Processor: Byte multiplexer channel (one is standard), block multiplexer channels (five are standard) ... see M3031 pages.

4300 Processors: Byte multiplexer channel ... block multiplexer channel ... see M4331, 4341, 4361, 4381 pages.

3776 Communication Terminal mdl 3 or 4, or 3777 Communication Terminal mdl 3 or 4: 3411 Magnetic Tape Unit and Control mdl 1 Attachment feature (#7801) on the terminal ... see "Special Features" in M3776 or 3777 pages. The 3411 requires System/3-3770/3790 Communication System Attachment feature (#7003).

3790 Communication System: A Magnetic Tape Attachment feature (#7840) on the 3791 Controller. The 3411 requires a 3790 Attachment feature (#7003).

3800 Printing Subsystem: Tape-to-Printing Subsystem Feature (#7810) on the 3800 ... see "Special Features" in M3800 pages. **Note:** A control unit position is not required. 3410 and 3411 mdl 3s only may be attached. Up to eight tape control units may be attached provided that power sequencing and control connection for all other than one are provided by a system.

3881 Optical Mark Reader: A 3881 mdl 2. One 3410 mdl 1 only may be attached.

3886 Optical Character Reader: A 3886 mdl 2. One 3410 mdl 1 only may be attached.

Magnetic Tape: IBM Multi-System Tape (MST) or equivalent, is recommended for optimum performance. The minimum properties required for satisfactory performance are described in *Tape Requirements for One-Half Inch Tape Units*, GA32-0006-5.

HIGHLIGHTS

The 3410 is a single tape unit controlled by a 3411. The 3411 is a single channel control unit with one tape drive.

- Efficient, compact, space-saving design.
- Dual Density feature ... allows processing of data recorded at 1600 bpi PE or 800 bpi NRZI.
- 7-Track feature ... tape written in 7-track format compatible with tapes written at 200, 556, 800 bpi by 729/7330/7335 and 2401/2402/2403/2404/2415/3420 tape drives equipped with 7-track read/write heads. **Note:** 7-track tapes cannot be read with a 3776 mdl 3 or 4, or a 3777 mdl 3.
- Radial attachment of tape unit permits limited off-line servicing.
- Simplified tape threading path.

Checking: During write operations, both parity and signal amplitude are checked. (When utilized with a 3881 Optical Mark Reader and the 3886 Optical Character Reader, both are checked in 800 bpi NRZI ... signal amplitude only in 1600 bpi.) During read operation, parity is checked.

Error Correction: In 1600 bpi PE recording format, single-track error correction in flight takes place. For 9-track 800 bpi NRZI, track in error (T.I.E.) is provided (not applicable when utilized with 3881 Optical Mark Reader and the 3886 Optical Character Reader).

3410/11 (cont'd)

Functions: The following table indicates feature numbers for corresponding functions:

Subsystem Function	Feature Name	3411 Control Unit	3410* Tape Unit (includes tape unit on 3411)
1600 bpi 9-track only	Single Density	Standard	#3211
1600 bpi PE/800 bpi NRZI 9-track	Dual Density	#9150	#3211 or #3221
1600 bpi PE/200-556-800 bpi NRZI 7-track	7-track	#9160**	#3211 or #6550

* Tape units must all be same mdl as 3411.

** Feature #9160 not available on System/38.

Characteristics	Mdl 1	Mdl 2	Mdl 3
Data rate (kb/sec)			
at 1600 bpi (PE)	20	40	80
at 800 bpi (NRZI)	10	20	40
at 556 bpi (7-track)	6.9	13.9	27.8
at 200 bpi (7-track)	2.5	5.0	10.0
Recording Density (bpi)	1600/800/556/200 (all mdls)

For installation in Japan, specify power cable #2746 for 60 Hz, or #2747 for 50 Hz.

- Dual Density, Control (3411 only) - #9150: Permits attachment of 3410s equipped with Dual Density, Tape Unit (#3221) and installation of Dual Density, Tape Unit (#3221) on the 3411 itself. 3410s equipped with Single Density, Tape Unit (#3211) can also be attached. Limitations: Cannot be installed on same 3411 with #9160. Field Installation: Yes.
- 7-Track, Control (3411 only) - #9160: Permits attachment of 3410s equipped with 7-Track, Tape Unit (#6550) and installation of 7-Track, Tape Unit (#6550) on the 3411 itself. 3410s equipped with Single Density, Tape Unit (#3211) can also be attached. #9160 includes the translator function which, when used, causes 8-bit bytes from the I/O interface to be written on tape as 6-bit BCD characters and 6-bit characters read from tape to be translated into their EBCDIC equivalents. The Data Conversion function, also included, allows reading and writing of 8-bit bytes on 7-track tape by converting four tape characters to three storage bytes and vice versa. Limitations: Cannot be installed with #9150. Cannot be used with a 3776 mdl 3 or 4, or a 3777 mdl 3 or 4, not available on System/38. Field Installation: Yes.

- Additional Tape Units (3411 only) - #9001: Required if the number of tape drives is to exceed four (one 3411 plus three 3410s). Field Installation: Yes.
- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.
- Language Groups:

English - #2927	Italian - #2932
French - #2928	Japanese - #2930
German - #2929	Spanish - #2931
- Density Formats: The 3410/3411 subsystem can operate in three density formats - 1600 bpi PE, single density ... or 1600/800 bpi, dual density ... or 200/556/800 bpi, 7-track. With the exception of single density, which is standard on the control unit of the 3411, a feature number for the format desired must be specified for each tape unit and the control unit ... see "Special Features" for limitations. Dual Density, Control (#9150) is required on the 3411 for Dual Density, Tape Unit (#3221) on the 3411 and attached 3410s ... see Specify #9150 above. 7-Track, Control (#9160) is required on the 3411 for 7-Track, Tape Unit (#6550) on the 3411 and attached 3410s ... see Specify #9160 above.
- System Attachments: #7003 is required on all System/3 mdls 8/10/12/15, and S/370 Attachment S/370 Mdl 115/125 (#7361) is required for attachment to a 3115 (except mdl HG2) or 3125 (except mdl HG2 and I2). When attached to 3115 mdl HG2, 3125 mdl HG2 or I2, RPQ 870061 is required on the 3411 ... see "Special Features". S/370 Attachment (#7360) is required for attachment to a S/370 mdls 135, 135-3, 138, 145, 145-3, 148, 155, 158, a 3031 Processor, or any 4300 processor, and for attachment to a 3800 mdl 3. System/3-3770/3790 Communication System Attachment (#7003) is required for attachment to a 3776 mdl 3 or 4, or a 3777 mdl 3, or a 3790 system.

Note: Not available without specifying one of the system attachments listed above.

SPECIAL FEATURES

Single Density, Tape Unit (#3211): [3410, 3411 any mdl] Permits the 3410 or the tape unit on the 3411 to operate at 1600 bpi PE only. Limitations: Cannot be installed with #3221 or #6550. Field Installation: Yes. Prerequisites: If installed on the 3886 Optical Character Reader, #6490 on the 3886.

Dual Density, Tape Unit (#3221): [3410, 3411 any mdl] Permits the 3410 or the tape unit on the 3411 mdl 1, 2, or 3 to operate at 800 bpi NRZI as well as 1600 bpi PE. Limitations: Cannot be installed with #3211 or #6550. Field Installation: Yes. Prerequisites: #9150 on the 3411 (see "Specify") or #3550 on the 3881 or #6485 on the 3886.

7-Track, Tape Unit (#6550): [3410, 3411 any mdl] Permits the 3410 or the tape unit on the 3411 to operate at 200, 556 or 800 bpi NRZI in the 7-track format compatible with 729, 7330, 7335 and 2401, 2402, 2403, 2404, 2415, 3420 tape units equipped with 7-track read/write heads. Tape units with this feature will only read or write 7-track tape. Limitations: Cannot be installed with #3211 or #3221, or on System/38. Cannot be used with a 3776 mdl 3 or 4 or a 3777 mdl 3. Field Installation: Yes. Prerequisites: #9160 (see "Specify") on the 3411.

System/3 mdls 8/10/12/15/ and System/38 - 3770/3790 Communication System Attachment (#7003): [3411 mdl 1, 2, 3] To attach a 3411 with up to three 3410s to a System/3 mdl 8, 10, 12, 15 or System/38, or to a 3791 Controller, or to attach one 3411 mdl 1 to a 3776 Communication Terminal mdl 3 or 4, or a 3777 Communication Terminal mdl 3 or 4. Prerequisites: 3411 (#7960) on 5408 and 5412, or 3411 (#7951) on the 5410 and 5415, or 3411 (#7960) on System/38, or #7801 on the 3776 mdl 3, or 4 or 3777 mdl 3. Maximum: One. Field Installation: Yes. Limitations: Cannot be installed with #7360 or #7361.

S/370 - 3800 Attachment (#7360): [3411 mdl 1, 2, 3] To attach the 3411 to a S/370 mdl 135, 135-3, 138, 145, 145-3, 148, 155, 158, a 3031 Processor, or any 4300 processor.

[3411 mdl 3] To attach the 3411 mdl 3 to a 3800 Printing Subsystem. Up to eight control units may be attached to the 3800 provided that power sequencing and control connection for all other than one are provided by the system. Limitations: Cannot be installed with #7003 or #7361 or RPQ 870061. Field Installation: Yes. Prerequisites: A control unit position on a system channel of the 3135, 3135-3, 3138, 3145, 3145-3, 3148, 3155 or 3158.

MACHINES

3410/11 (cont'd)

S/370 Mdl 115/125 Attachment (#7361): [3411 mdl 1, 2, 3] To attach the 3411 to a S/370 mdl 115 (except mdl HG2) or 125 (except mdl HG2 or I2). When attached to 3115 mdl HG2 or 3125 mdl HG2 or I2, RPO 870061 is required. Limitations: Cannot be installed with #7003, #7360 or RPO 870061. Field Installation: Yes. Prerequisites: #4675 on 3115 or 3125.

The Following Table Has Been Revised:

TERMS and CONDITIONS

3420 MAGNETIC TAPE UNIT MDLS 3, 5, 7

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

- Magnetic tape unit for S/360, S/370, 3090, 4300 and 9370 Processors.

MODELS 3, 5, 7

- Model 3 003:** 120,000 8-bit bytes/second; for use with any S/370 Processor, with a 30XX Processor, with all 4300 Processors, 9375, 9377 Processors or 3800 Printing Subsystem.

- Model 5 005:** 200,000 8-bit bytes/second; for use with any S/370 Processor, with all 4300 Processors, 9375, 9377 Processors or 3800 Printing Subsystem.

- Model 7 007:** 320,000 8-bit bytes/second; for use with any S/370 Processors except 3115 and 3125, with all 30XX processors, all 4300 Processors, 9375, 9377 Processors or 3800 Printing Subsystem.

Prerequisites: A 3803 Tape Control.

Limitations: 3420 mdl 7 cannot be attached to the S/370 mdl 115 or 125.

If the 3420 mdl 5 is to be ordered for attachment to a selector sub-channel feature of the 2870, consult IBM.

Programming support for the extended diagnostic capabilities of the 3420 requires a minimum system size of 32K.

When attached to a S/360 mdl 30 operating in compatibility mode: (1) 3420 mdl 5 is not supported at 1600 bpi -- (2) 3420/1400 Compatibility (#9750) must be specified for the S/360 mdl 30. These limitations do not apply when the S/360 mdl 30 is operating in native mode for I/O operations; for example, under CS/30.

- When attaching to 9375 or 9377 Processor the 3803 Tape Control Unit must be attached to the Block Multiplexer Channel (#6003).

HIGHLIGHTS

Radial attachment of tape drives to the control unit via a switch located in the control unit, permitting offline service of individual tape units without disturbing the subsystem. 24-line multiplex interface provides advanced diagnostic capability. MST circuitry reduces card count while increasing functions: Expanded sense data, better diagnostic capability, unique device identification, EC level and feature identification.

Limitations: IBM Multi-System Tape (MST) or equivalent is recommended for optimum performance. The minimum properties required for satisfactory performance are described in Tape Requirements for One-Half Inch Tape Units, GA32-0006.

Automatic Threading and Cartridge Loading: Threading is automatic with or without the wraparound cartridge; automatic retry (with cartridge only) in case of load failure, stopping on the leader to prevent damage to the recorded surface. With the wraparound cartridge, tape is not exposed to contamination or damage.

9-track 1600 bpi Phase-encoding Operation: Data is recorded parallel by bit, serial by byte, at 1600 bytes/inch, phase-encoded, in nine tracks across the width of the tape. The data format uses eight of the nine bits for data; the ninth bit is a parity bit. Data is recorded in odd parity. The eight bits of one byte can represent an alphabetic character, zoned decimal digit, two decimal digits (packed), a special character, or eight binary bits. The recording format is compatible with the 1600 bpi PE recording of tape units 2401, 2402, 2403, 2404, 2415 mdls 4, 5 and 6, and 2420 mdls 5 and 7. For 9-track 1600 bpi PE operation only, specify Single Density, #6631. See "Special

Features". Prerequisites: One of the following must be specified on the 3803 Tape Control: #9570 -- #3551 -- #6407.

9-track 800 bpi NRZI Operation: Tape is written at 800 bpi in the 9-track NRZI format as well as in the 1600 bpi PE format. Data representation is the same as for 1600 bpi PE operation. For 9-track 800 bpi NRZI capability, Dual Density (#3550) is required on the tape unit. See "Special Features". Prerequisites: #3551 on the 3803. (A 3420 with #3550 can operate in 1600 bpi PE mode with any 3803.)

7-track Operation: Tape is written in the 7-track format compatible with tapes written at either 556 or 800 bpi by 729/7330/7335 and 2401/2402/2403/2404/2415 tape drives equipped with 7-track read/write heads. For 7-track operation, Seven-Track (#6407) is required on the tape unit. See "Special Features". Prerequisites: #6408 on the 3803.

Checking: Each byte is parity-checked while tape is being read. Data written on tape is read back instantly and checked as in reading, with full parity check.

Error Correction: Single track drop-out errors are corrected "in flight" during 1600 bpi read operations.

Read Backward: All tapes (9- or 7-track) written on a 2401/ 2402/ 2403/ 2404/ 2415/ 2420 can be read by the 3420 in a forward or backward direction. The Data Conversion function is inoperative during backward read of 7-track tapes.

Characteristics	Mdl 3	Mdl 5	Mdl 7
Nominal Data Rate (Kb/sec)			
At 1600 bpi PE	120	200	320
At 800 bpi NRZI	60	100	160
At 556 bpi (7-tr.)	41.7	69.5	111.2
(Bytes/Inch)			
(1600/800/556)	Yes	Yes	Yes
Tape Speed (In./Sec.)	75	125	200
Nominal IBG (In.)			
9-track	0.6	0.6	0.6
7-track	0.75	0.75	0.75
Nominal IBG Time (ms)			
9-track	8.0	4.8	3.0
7-track	10.0	6.0	3.8
Rewind Time (2400 ft. Reel, Seconds)	60	60	45
Rewind-Unload Time (2400 ft. Reel, Sec.)	66	66	51
Auto Threading Time* (Seconds)	10	10	7
Nominal Read/Write Access** Time(ms)	4.0	2.9	2.0

* From initiation (using mounted supply reel) to "Tape Drive Ready".

** Access time is the interval from initiation of a write or forward read command until the first data byte is read or written when tape is brought up to speed from a stopped status.

Publications: GC20-0001

SPECIFY

- Tape Density: One, and only one, of the following must be specified for each tape unit. This applies to MES orders (for field changes) as well. See "Special Features".
 - Single Density #6631 for 9-track 1600 bpi PE operation only.

MACHINES

- Dual Density #3550 for 9-track 800 bpi NRZI operation as well as 1600 bpi PE.
- Seven-Track #6407 for 7-track 556 or 800 bpi NRZI operation.

Note: MES orders for these features to effect field changes should consider that one of these three features must be installed on the 3420 or it is incomplete.

- Power (AC, 3-phase):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	

- Altitude: If 3420 tape drives are to be installed or pneumatics replaced at high altitude (4,001 to 8,000 feet), #9830 must be specified.
- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.
- Machine Nomenclature:

English #2927
French #2928
German #2929

SPECIAL FEATURES

Dual Density (#3550): Permits the tape unit to operate at 800 bpi NRZI 9-track as well as at 1600 bpi PE. Limitations: Cannot be installed with either Single Density (#6631) or Seven-Track (#6407).

Field Installation: Yes, except for machines with serial #9XXXX. Prerequisites: #3551 on the 3803 Tape Control.

Seven-Track (#6407): Permits the tape unit to operate at either 556 or 800 bpi NRZI in the 7-track format compatible with 729, 7330, 7335, and 2401, 2402, 2403, 2404, 2415 tape units equipped with 7-track heads. Field Installation: Yes, only to replace Dual Density (#3550) -- otherwise available at time of manufacture only. Limitations: Cannot be installed with either Single Density (#6631) or Dual Density (#3550). Prerequisites: #6408 on the 3803.

Single Density (#6631): Permits the tape drive to read or write tapes at 1600 bpi PE. Prerequisites: One of the following features must be specified for the 3803 Tape Control Unit: #9570, #3551 or #6408. Field Installation: Yes. Limitations: Cannot be installed with either Dual Density (#3550) or Seven-Track (#6407).

SUPPLIES

One standard 10-1/2" reel of magnetic tape in a wraparound cartridge is shipped with each tape unit. For additional reels of tape and cartridges, see IBM.

3420 MAGNETIC TAPE UNIT MODELS 4, 6, 8

PURPOSE

- Magnetic tape unit for S/370, 30XX, 4300, 9375, 9377 Processors.

MODELS 4, 6, 8

- Model 4 004:** 470,000 8-bit bytes/second for use with any S/370 Processor except 3115 and 3125, any 30XX Processor, any 4300 Processor, 9375, 9377 Processor, and with a 3800 Printing Subsystem.

- Model 6 006:** 780,000 8-bit bytes/second for use with any S/370 Processor except 3115 and 3125, any 30XX Processor, 4331 Model Group 2 and 11, 4341, 4361, 4381 Processor, 9375, 9377 Processor, and with a 3800 Printing Subsystem.

- Model 8 008:** 1,250,000 8-bit bytes/second for use with any S/370 Processor except 3115 and 3125, any 30XX Processor, 4331 Model Group 2 and 11, 4341, 4361, 4381 Processor, 9375, 9377 Processor, and with a 3800 Printing Subsystem.

Limitations: 3420 mdl 4, 6 and 8 via a 3803 Control Unit mdl 2 are not supported on byte multiplexer, multiplexer or 2870 selector subchannels at either 1600 bpi or 6250 bpi.

3420 Models 6 or 8 cannot be attached to a S/360 mdl 50. When contemplating the attachment of 3420 mdl 6 or 8 to S/370 mdl 135, 135-3, 145 or 145-3, consult System/370 Model 135 Channel Characteristics, (GA33-3010), System/370 Model 138 Channel Characteristics, System/370 Model 145 Channel Characteristics, GA24-3573, or System/370 Model 148 Channel Characteristics, IBM 4331 Channel Characteristics, GA33-1527 (Mdl Group 1), GA33-1535 (Mdl Group 2) or GA33-1550 (Mdl Group 11).

- Prerequisites:** A 3803 Tape Control mdl 2. When attaching to 9375 or 9377 Processor the 3803 Tape Control Unit must be attached to the Block Multiplexer Channel (#6003).

HIGHLIGHTS

Nominal recording density of 6250 user bytes per inch with a 0.3-inch inter-block gap.

Radial Attachment: Attachment of tape drives to the control unit via a switch located in the control unit, permitting offline service of individual tape units without disturbing the subsystem. 24-line multiplex interface provides advanced diagnostic capability.

Cleaning Mechanism: A new cleaning mechanism is engaged during auto-threading, rewinding, and unloading operations to remove loose contaminants from the tape surface and to protect the recording head. This new cleaning mechanism makes tape cleaning a byproduct of tape processing. The cleaning mechanism does not, however, replace drive cleaning performed by the operator, nor does it replace the need for normal library maintenance.

Automatic Threading and Cartridge Loading: Threading is automatic with or without the wraparound cartridge; automatic retry (with cartridge only) in case of load failure, stopping on the leader to prevent damage to the recorded surface. With the wraparound cartridge, tape is not exposed to contamination or damage.

Automatic Read Amplification: Automatically adjusts the amplifier gain in the tape drive to each individual reel of tape when operating at 6250 bpi.

Checking: Data written on tape is read back instantly to ensure later readability.

Read Backward: Tapes written at 6250 bpi mode can be read in a forward or backward direction. Tapes written at 1600 bpi

(phase-encoded) mode can be read in a forward or backward mode if the 3420 mdl 4, 5 or 8 is equipped with the 6250/1600 optional feature.

6250/1600: Optional feature allows the 3420 mdl 4, 6 or 8 to read and record at 1600 bpi (phase-encoded) density as well as 6250 bpi density.

Tape Media: IBM Multi-System Tape (MST) or equivalent is recommended for optimum performance. The minimum properties required for satisfactory performance are described in "Tape Requirements for One-Half Inch Tape Units", GA32-0006.

Characteristics	Mdl 4	Mdl 6	Mdl 8
Tape Speed (ips)	75	125	200
Recording Density 6250/1600	Yes	Yes	Yes
Nominal Data Rate at 6250 Kb/sec.	470	780	1250
at 1600 Kb/sec.	120	200	320
Nominal IBG (in) at 6250	0.3	0.3	0.3
at 1600	0.6	0.6	0.6
Nominal Read/Write Access (ms) *			
at 6250	2.3/ 2.1	1.6/ 1.5	1.1/ .95
at 1600	4.0/	2.6/	1.7/
Maximum Rewind Time (seconds)	70	60	45
Maximum Rewind- unload (sec.)	76	66	51
Maximum Auto Thread (sec.) **	10	10	7

* Access time is the time required to read or write the first byte of data in a block after a read/write instruction has been initiated from a stopped position (read/write head positioned in the IBG).

** From initiation (using mounted supply reel) to "Tape Drive Ready".

SPECIFY

- Tape Density: One and only one of the following must be specified for each tape unit (see "Special Features"):

#6420 for 6250 bpi density only.

#6425 for 1600 bpi density (phase-encoded) as well as 6250 bpi density.

- Power (AC, 3-phase, 4-wire): Must be consistent with system voltage.

50 Hz	60 Hz

SPECIAL FEATURES

6250 Density (#6420): Permits the tape unit to operate at 9-track 6250 bpi. Limitations: Cannot be installed with 6250/1600 density (#6425).

6250/1600 Density (#6425): Permits the tape unit to operate at 6250 bpi density as well as 1600 (phase-encoded) density either this feature or #6420 must be specified. Limitations: Cannot be installed with 6250 Density (#6420).

ACCESSORIES (NONE)

SUPPLIES

One standard 10-1/2 inch reel of magnetic tape tested for 6250 bpi in an easy-load cartridge is shipped with each tape unit. For additional reels of tape and cartridges, see IBM.

**3422 MAGNETIC TAPE SUBSYSTEM****PURPOSE**

The 3422 is a 10-1/2 inch reel intermediate performance magnetic tape subsystem. The 3422 records or reads data at 6,250 bpi or 1600 bpi. The 3422 has a tape speed of 125 inches per second (ips). This allows a nominal data rate of 780KB per second at 6,250 bpi or 200KB per second at 1,600 bpi.

The 3422 consists of a model A01 with a tape control and one tape drive housed in the same frame and a model B01 with one tape drive only. A maximum of seven model B01s can be attached to a model A01 for a total of eight drives per string. The primary use of the 3422 will be as a save/restore and processing device on intermediate systems and as a 10-1/2 inch reel companion drive for 3480 tape subsystems.

The 3422 will attach to the 43XX, 308X, 3090, 5381 mdls 6, 7, and 8, 5382 mdls 18, 20 and 40, and 9370.

Optional features for the 3422 include a 64K byte speed-matching buffer that supports data streaming mode and allows up to three megabytes per second data transfer rate between the channel and the control unit. Also offered is a two-channel switch and a communicator that allows the 3422 control unit to attach to a second 3422 control unit and be able to address up to 16 tape units (2x16). Data streaming mode and the communicator are not supported on the S/38.

Programming support for the 3422 Magnetic Tape Subsystem is provided by VSE/SP (VSE/AF), VM/SP, VM/SP HPO, VM/XA Systems Facility, MVS/SP, and CPF.

MODELS

Model A01: Tape control and one tape drive

Model B01: One tape drive only

Prerequisites: An available control unit position on a block multiplexer channel. Feature code #7970-3422/3430 magnetic tape attachment is required on the 5381 or 5382.

Attaches to a 43XX, 308X, 3090, 5381 mdls 6, 7, and 8, 5382 mdls 18, 20, and 40, and 9370.

Maximum: A maximum of seven B01 models can be attached to an A01 model for a total of eight drives per string. A maximum string of three B01s and one A01 is supported on the System/38.

Limitations: A 3422 mdl A01 must be the first drive of a string.

HIGHLIGHTS

- Dual-density: 6,250/1,600 bpi.
- Nominal data rate of 780KB per second at 6,250 bpi.
- Optional two- and three-megabyte data streaming channel mode via a 64K speed matching buffer on 370 Architecture Systems.
- Auto thread/auto load of 10-1/2 inch reel contained in wraparound cartridge.
- Up to eight tape units per string on 370 Architecture Systems.
- Up to four tape units per string on System/38.
- Reduced power and space requirements over 3420/3803 Magnetic Tape Subsystem.

Characteristics:

Recording Density	6,250/1,600 bpi (246/63 B/mm)
Tape Speed	125 ips (318 cm/sec)
Data Rate, Nominal	
at 6,250 bpi (246 B/mm)	780Kb/sec
at 1,600 bpi (63 B/mm)	200Kb/sec
Nominal IBG	
at 6,250 bpi	7.6mm (0.3 in.)
at 1,600 bpi	15.2mm (0.6 in.)
Nominal Read Access Time*	
6,250 bpi	2.6ms
1,600 bpi	3.9ms
Nominal Write Access Time*	
6,250 bpi	1.8ms
1,600 bpi	3.6ms
Rewind Time	
2,400 ft reel (731.5m)	1.2 minutes

* Access time is the time required to read or write the first byte of data in the block after a read/write instruction has been initiated from a stopped position in the IBG.

Bibliography: GC20-0001

SPECIFY

- Power: #9010 for 60 Hz, #9005 for 50 Hz.
- Communicator cable length: (Mdl A01 only, prerequisite #3010) #9020 for 10 meter, #9025 for 30 meter.
- Machine Nomenclature:

Brazilian Portuguese	#2938
English	#2924
French	#2928
Spanish	#2931
- Color: Pebble gray only.

MODEL CONVERSION (NONE)**SPECIAL FEATURES**

These features can only be installed on the model A01.

Two-Channel Switch (#3005): Allows the 3422 control unit to be attached to two System/370 mode-only host channels or two System/38 tape adapters. Maximum: One. Field Installation: Yes.

Communicator (#3010, #3015): Allows the 3422 control unit to attach to a second 3422 control unit and to be able to address up to 16 tape units (2x16). If the Communicator is being ordered, the first 3422 control unit must be identified as the primary (#3010) and the second 3422 control unit must be identified as the secondary (#3015). In addition, the Communicator cable length (#9020 or #9025) must be specified with the primary (#3010) 3422 control unit. Cable length choices are 10 meters or 30 meters. Maximum: One. Field Installation: Yes. Limitation: Cannot be installed on the System/38.

Data Streaming (#3020): Supports attachment of the 3422 to either a two-megabyte or three-megabyte data streaming channel. Maximum: One. Field Installation: Yes. Limitation: Cannot be installed on the System/38.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3430 MAGNETIC TAPE SUBSYSTEM

PURPOSE

Magnetic tape Subsystem for System/38 Models 4, 5, 6, 7, and 8, Virtual Storage S/370 Models 135 - 168, 4331, 4341, 4361, 4381, 3031, 3032, 3033, and 9370.

MODELS

Model A01: Tape control and a single tape unit.

Model B01: Second, third, or fourth tape units which attach to the Model A01.

Maximum Configuration: Up to 3 3430 Model B01s may be attached to a 3430 Model A01 for a total of 4 drives.

Prerequisites:

- A 3430 Model A01 must be the first drive of the string.
- 4331 Model Group 1 and 2, 4361 - Block Multiplexer Channel (#1421).
- System/38 - 3430 Attachment (#7970).
- 9370 Attachment (#6003).

The 3430 Tape Subsystem attaches via the selector, or the block multiplexer channels of 370 Models 135 - 168, 4331, 4341, 4361, 3031, 3032, 3033, or 9370.

HIGHLIGHTS

- Dual-density 246/63 bytes per mm (6,250/1,600 bytes per inch).
- LSI components for improved reliability.
- Instantaneous data rate of 312,500 bytes per second at 246 bytes per mm (6,250 bytes per inch).
- Radial attachment of tape drives for ease of service.
- Space saving as a result of compact packaging and control unit housed in first drive.
- Micro-diagnostic package for offline diagnosis and repair verification.

Checking: During a write operation, both parity and signal amplitude are checked. During a read operation, parity is checked.

Error Correction: Reading at 246 bytes per mm (6,250 bytes per inch), double-track errors are corrected automatically "in flight". Reading at 63 bytes per mm (1,600 bytes per inch) single-track errors are corrected automatically "in flight".

Characteristics:

Data Rate, Instantaneous	
63 B/mm (1,600 Bpi)	80kb/sec
246 B/mm (6,250 Bpi)	312.5kb/sec
Recording Density	
	246/63 B/mm
	(6,250/1,600 Bpi)
Tape Speed	
	127cm/s (50 ips)
Nominal IBG	
63 B/mm (1,600 Bpi)	15mm (0.6 in.)
246 B/mm (6,250 Bpi)	11mm (0.45 in.)
Write	8/11mm
Read	(0.3/0.45 in.)
Nominal Read/Write Access Time *	
63 B/mm (1,600 Bpi)	6.0ms

246 B/mm (6,250 Bpi)	6.0ms
Rewind Time per Reel	
610m (2,400 feet)	2.7 minutes

* Access time is the time required to read or write the first byte of data in the block after a read/write instruction has been initiated from a stopped position in the IBG.

Magnetic Tape: IBM Multi-System Tape (MST), or equivalent, is recommended for optimum performance. The minimum properties required for satisfactory performance are described in "Tape Requirements for One-Half Inch Tape Units" (GA32-0006).

English #2924	Spanish #2931

SPECIAL FEATURES

Multiple Drive Attachment Feature (#4991): If the number of tape units in the string exceeds 2 tape units (i.e., the second Model B01 is to be attached), the multiple drive attachment feature must be specified to be installed in Model A01, 1 feature per Model A01. Field Installation: Yes.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3480 MAGNETIC TAPE SUBSYSTEM

PURPOSE

The 3480 mdl A11 and B11, designed for intermediate systems, is the newest 3480 family member. Data is recorded on 18 tracks of tape contained in a compact cartridge (Cartridge System Tape) introduced for use with the 3480 Magnetic Tape Subsystem. This model of the 3480 has a nominal data rate of 1.5 million bytes per second, and a linear recording density of approximately 38,000 bytes per inch. This 3480 Magnetic Tape Subsystem consists of a 3480 Mdl A11 Control Unit and a 3480 Mdl B11 Magnetic Tape Unit (has two drives). The 3480 mdl A11 Control Unit attaches up to four 3480 mdl B11 Magnetic Tape Units. The maximum subsystem configuration is two coupled 3480 mdl A11 Control Units attached to eight channels and controlling eight 3480 mdl B11 Magnetic Tape Units. A host processor may attach multiple 3480 Magnetic Tape Subsystems. Optional features for the 3480 mdl A11 and B11 include: Dual Control Unit Communications, Control Unit Coupler, up to three additional Channel Attachments, and an Automatic Cartridge Loader. A 3480 mdl A11 and B11 can be Field Upgraded to a 3480 mdl A22 and B22, by installing the Model Upgrade Package and the Dual Control Unit Communications Feature. Models A11 and B11 may not be intermixed in the same subsystem with mdls A22 and B22.

MODELS

Model A11: Control Unit

Model A22: Control Unit

Model B11: Magnetic Tape Unit

Model B22: Magnetic Tape Unit

Limitations: Models A11 and B11 may not be intermixed in the same subsystem with mdls A22 and B22. Cable limitations are identified in "IBM System/370 Installation Manual, Physical Planning" (GC22-7064).

Maximum Configuration: Two model A11 Tape Control Units may be connected together by installing the Control Unit Coupler (#3211) and the Dual Control Unit Communications feature (#3201) to provide data paths from each control unit to the four mdl B11 Magnetic Tape Units (eight drives) on each mdl A11 control unit. In the same manner, two mdl A22 Tape Control Units may be connected together by the Control Unit Coupler to provide data paths from each control unit to the four mdl B22 Magnetic Tape Units (eight drives) on each mdl A22 control unit. Mdl A11 Control Units and B11 Tape Drives may not be intermixed in the same subsystem as mdl A22 Control Units and B22 Tape Drives. Special features provide attachment of up to three additional channels per CU. Maximum resultant configuration is two control units attached to eight channels accessing eight 3480 Magnetic Tape Units (16 drives). The Dual Control Unit Communications feature #3201 is not standard on the A11 Control Unit and must be installed for the above maximum configuration to be attained.

Prerequisites: For the Magnetic Tape Control Unit, mdl A11 or A22, there must be an available channel Control Unit position. The Control Unit and the Magnetic Tape Unit must both be of the same model designation.

HIGHLIGHTS

3480 Mdl B11 or B22 Magnetic Tape Unit

- Reads and writes data at an instantaneous data rate of approximately 1.5 or 3 million bytes per second, respectively.
- Linear recording density of approximately 38K BPI.
- Records 18 tracks on tape, enclosed in a plastic cartridge.

- Advanced mechanical and electronic components, micro-processor control, and a new error correction code.
- Low velocity tape operation, digital tachometers and control unit data buffering eliminate the requirements for traditional capstan and vacuum columns and provide a compact drive with lower power and cooling requirements.
- Display of messages on each drive, cleaning cartridges, and automatic tape threading enhance operator productivity.
- The mdl B11 can be field upgraded to a mdl B22.
- Automatic Cartridge Loader can be installed on both the B11 and B22.

3480 Mdl A11 or A22 Control Unit

- Attaches to non-streaming block multiplexer channels.
- Attaches to 1.5M, 2M or 3M bps streaming channels.
- Controls up to four units (eight drives), respectively. (Must be all of same model designation.)
- Two Control Units, of the same model designation, may be coupled together for mutual access to all 16 attached drives.
- Incorporates 512KB data buffer (Model A11) or 1,024Kb data buffer (Model A22) for channel speed data response to the host processor, and masking of tape motion from host.
- Utilizes host independent error correction code.
- Error recovery and logging in control unit and/or host.
- Provides a Data Security Erase function which, when invoked, overwrites previously written data with a random data pattern.
- The mdl A11 can be field upgraded to a mdl A22 by installing the Model Upgrade Package and the Dual Control Unit Communications Feature.

Subsystem Characteristic Summary

Drive:

- Instantaneous data rate (M bps): 1.5 and 3 for B11 and B22 respectively
- Linear recording density (K BPI): 38 (approximately)
- Parallel recording tracks: 18
- Load/Unload time (sec): 7
- Cartridge rewind time (sec): 48.0 (approximately)

Control Unit: Data Buffer (KB): 512 (Model A11), 1,024 (Model A22)

Cartridge: Cartridge Capacity (MB) (24K blocks): 200*

* Nominal IBM Cartridge System Tape (CST) capacity is 200MB at a data block size of 24K. Individual cartridges have normal variations due to manufacturing tolerances. Data written on a standard 10.5 inch reel of magnetic tape at 6,250 bpi in block sizes of 4KB or larger, typically will be contained in a tape cartridge.

Description: The 3480 mdl A11 Control Unit attaches up to four 3480 mdl B11 and the 3480 mdl A22 Control Unit attaches up to four 3480 mdl B22. Each 3480 B11 or B22 houses two tape drives. Each A11 and A22 can have a maximum of eight tape drives per control unit. Two Control Units, of the same model designation, may be coupled together with the Dual Control Unit Coupler providing concurrent access by the two control units to their attached 16 drives. Each control unit provides for attachment of up to four channels; one channel attachment is standard. Up to three Additional Channel Attachment features may be added to each control unit. A full-featured two control unit subsystem can thus attach up to 16 drives and to as many as eight host channels. Mdls A11 and B11 may not be intermixed in the same subsystem with mdls A22 and B22.

A message display integral to each drive indicates drive status. The message display can also be used by the host software when operating in full function mode. Messages are available in one of six languages.

Operator productivity may be improved by installing the Automatic Cartridge Loader (#2511) which allows the operator to premount up to five cartridges per drive in addition to a cartridge already mounted in the drive.

Data to be read or written on tape is buffered in the Control Units 512KB Buffer. The Control Unit dynamically allocates buffer space for performance optimization of the attached drives. The data buffer is designed to mask drive repositioning actions from the channel and the host. At completion of tape motion, the tape coasts beyond the interblock gap. The drive then positions tape for the next operation.

Initial error correction and error logging occurs in the control unit. If control unit error recovery is unsuccessful, host software error recovery may be initiated.

Configuration: The Magnetic Tape Unit contains two drives in a single frame. A maximum of four frames (eight drives), of the same model designation, may be attached to one Control Unit. Two Control Units, of the same model designation, may be coupled together via the Dual Control Unit Coupler, providing concurrent access by the two control units to their associated 16 drives. Each control unit provides for attachment of up to four channels; one channel attachment is standard. Up to three Additional Channel Attachment features (#1511, #1512, #1513) may be added to each control unit. A full-featured two control unit subsystem can attach up to 16 drives (8 B11s or B22s) and as many as eight host channels. Host systems may attach multiple 3480 Magnetic Tape Subsystems.

All special features are field installable. The Dual Control Unit Communications feature is integrated on the mdl A22 and optional on the mdl A11. This feature can be both factory and field installed. The mdls A11 and B11 are field upgradable to mdls A22 and B22; however, the Dual Control Unit Communications feature is required for the mdl A11 conversion.

Processor Attachment:

System	Non-Streaming Block Mltplxr	2M bps Block Mltplxr	3M bps Block Mltplxr
303X*	X		X
308X	X		X
4341	X	X	X
4361**	X	X	X
4381	X	X	X
3090	X		X
9373	X		
9375	X	X	X
9377	X	X	X

* Data Streaming (#4850) required for operation in data streaming mode.

** Data Chaining is not supported on 3480 A11, A22, B11 or B22.

SPECIAL FEATURES

Mdls A11 and A22 Control Unit:

Channel Attachment, First Additional (#1511): Provides mdl A11 or A22 Control Unit attachment to the first additional channel. Maximum: One. Field Installation: Yes.

Channel Attachment, Second Additional (#1512): Provides mdl A11 or A22 Control Unit attachment to the second additional channel. Maximum: One. Prerequisites: #1511. Field Installation: Yes.

Channel Attachment, Third Additional (#1513): Provides mdl A11 or A11 Control Unit attachment to the third additional channel for the full compliment of four channel attachments. Maximum: One. Prerequisites: #1512. Field Installation: Yes.

Control Unit Coupler (#3211): This coupler consists of two cables which, when connected to two 3480 mdl A11 or mdl A22 control units, permit the control units to access all (16) drives of the combined subsystem. Order only one coupler to couple two control units. Control Units must be of the same model. Maximum: One. Prerequisites: Yes. Feature #3201 must be installed on both A11s. Field Installation: Yes.

Dual Control Unit Communications (#3201): This feature when activated by the Control Unit Coupler (#3211) will allow up to eight (8) 3480 B11s to be attached to two (2) 3480 A11s. Mdls A11 and B11 may not be intermixed in the same subsystem with mdls A22 and B22. Maximum: One. Prerequisites: No. This feature (#3201) is a prerequisite for Model Conversion from A11 to A22. Field Installation: Yes.

Mdl B11 and B22 Magnetic Tape Unit:

Automatic Cartridge Loader (#2511): Automatic Cartridge Loader provides automatic cartridge mounting and demounting capability for two drives in 3480 Magnetic Tape Unit. One to five additional cartridges per drive may be premounted by the operator. Six cartridges per drive can be automatically demounted without operator

intervention. Maximum: One per mdl B11 or B22. Prerequisites:
None. Field Installation: Yes.

ACCESSORIES (NONE)

MODEL CONVERSIONS

To convert mdls A11 and B11 to mdls A22 and B22, the Dual Control Unit Communications feature (#3201) must be installed prior to or with this model conversion.

SUPPLIES

Tape Cartridges: One new IBM Cartridge System Tape (CST) and a tape cleaning cartridge are shipped with each 3480 mdl A11 Control Unit. For additional cartridges, contact your IBM representative.

3505 CARD READER

PURPOSE

Punched card input unit for a S/360 mdl 195, or all S/370, 30XX, 4300 processors.

MODELS

Rated 80-Column
Card Speed

Model B1	B01	800/minute
Model B2	B02	1200/minute

HIGHLIGHTS

The 3505 is a high-speed, fully buffered, card reader, containing its own control unit. With appropriate adapter and control features installed (see "Special Features"), the 3505 provides the power and logic to control one 3525 Card Punch.

All mdls have a 3,000-card capacity file feed and two 1,750-card capacity non-programmable stackers, which operate in an alternating mode. Feeding from the file feed hopper is by means of friction feed rolls with vacuum assist. Failure to feed a card from the hopper is followed automatically by up to three retries before the machine stops.

All mdls have read-column-eliminate capability, which provides the user with the ability, under program control, to suppress the reading of selected card columns. It is recommended to prevent reading in columns that could cause validity and read checks due to invalid codes or open-punched card scores.

Holes in the card are read by a light-sensing mechanism, which is checked for correct operation in every card cycle. Cards punched in either the Extended BCD Interchange Code (Data Mode 1) or Card Image (Data Mode 2) can be read. Machine checks are made for invalid codes (Data Mode 1 punching only), off-punching, and mispositioned cards.

Maximum: The number of 3505 mdls B1 and/or B2 that can be attached depends upon the number of system channel control unit positions available.

Prerequisites: Each 3505 requires an available control unit position on a system channel.

- S/360 and S/370 mdl 195: Selector channel of 2860, basic multiplexer channel of 2870, block multiplexer channel of 2880 ... see M2860, 2870, 2880 pages.
- S/370 mdl 115, 125: Byte multiplexer channel (special feature) ... see M3115, 3125 pages.

- S/370 mdl 135: Byte multiplexer channel (standard), selector channels (special features), block multiplexer channels (special features) ... see M3135 pages.
- S/370 mdl 135-3: Byte multiplexer channel (standard), or block multiplexer channels (special feature) ... see M3135-3 pages.
- S/370 mdl 138: Byte multiplexer channel (standard), block multiplexer channels (standard) ... see M3138 pages.
- S/370 mdl 145: Byte multiplexer channel (standard), selector channels first one is standard), block multiplexer channels (special features) ... see M3145 pages.
- S/370 mdl 145-3: Byte multiplexer channel (standard), block multiplexer channels ... see M3145-3 pages.
- S/370 mdl 148: Byte multiplexer channel (standard), or block multiplexer channels (standard) ... see M3148 pages.
- S/370 mdls 155, 158: Byte multiplexer channel (standard), second byte multiplexer channel (special feature), block multiplexer channels (first two are standard) ... see M3155 and 3158 pages.
- S/370 mdls 165, 168: Selector channel of 2860, basic multiplexer channel of 2870, selector sub-channels (special features) on 2870, block multiplexer channel of 2880 ... see M2860, 2870, 2880 pages.
- 3031, 3032 Processor: Byte multiplexer channel (one is standard), block multiplexer channels (five are standard) ... see M3031, 3032 pages.
- 3033 Processor: Byte multiplexer channel (two are standard), block multiplexer channels (ten are standard) ... see M3033 pages.
- 3081, 3083, 3084 Processor: Byte multiplexer channels, block multiplexer channels ... see M3081, 3083, 3084 pages.
- 3090 Processor: Byte multiplexer channels, block multiplexer channels ... see M3090 pages.
- 4300 Processor: Byte multiplexer channel, block multiplexer channel. See M4331, 4341, 4361, 4381 pages.

Card Limitations: Generally, special feature cards require careful handling and a favorable environment. Use of the following card features has been approved:

- Internal Scores (before separation): M-4, M-5, OM-2, OM-3, ID-1, ID-2, ID-3 and S-1. Note: When using OM-2 or OM-3, either reading must

be terminated prior to the column that is scored, or, reading of the scored column and the two adjacent columns must be suppressed by means of the program-controlled Read Column Eliminate feature (see "Special Features"). S-2 may be used prior to folding, and after folding if the card is properly flattened.

- External Scores (after separation): Column 1 and 80 end: M-3, M-4, M-5, M-6, M-7, M-11, OM-2, CF-4 and CF-11. Column 1 end only: OM-3. 12 and 9 edge: CF-1/9A. When using CF-1/9A scores on 51-column cards, consult IBM.
- Corner Cuts: Any corner: C1, C2, C3, and C5.
- Card Stock: Regular, edge-coated, and heavy duty.
- Port-A-Punch(R): Can be processed.

All other special feature cards may result in unsatisfactory performance and should be tested in an actual application prior to being recommended.

Publications: S/360 -- GC20-0360, S/370 -- GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): #9903 for 208V or #9905 for 230V ... must be consistent with system voltage.
- (Except Canada > Power (AC, 3-phase): Must be consistent with system voltage.

200V #2733
208V #9903
230V #9905

- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.
- Machine Nomenclature:

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931
- High Altitude Group: #9220 (60 Hz) or #2737 (50 Hz) is to be specified when card reader is to be installed at an altitude exceeding 4,300 feet.

SPECIAL FEATURES

(Japan only > 3525 Katakana Card Print Control (#2707): Provides control for 3525 Card Punch features: Basic Card Print (#1421) and Two-line Katakana Card Print (#2861) or Multiline Katakana Card Print (#2862). Limitations: Cannot be installed with 3525 Card Print Control

(#8100). Field Installation: Yes. Prerequisites: #8103 or #8105 on the 3505 ... #2861 or #2862 on the 3525.

Interchangeable Read Feed, 51/80-Column (#3921): (mdl B2) For feeding and reading 51-column cards. The 51 columns of data appear in positions 1 through 51 of the 80-position buffer. A special card weight, file feed, hopper liners and stacker guide assemblies are provided so that the operator can adjust for 80- or 51-column operations. Intermixed cards on the same operation are not supported. Reading speed of the 3505 is maintained. With this feature installed, the capacity of each stacker is permanently reduced to 1,500 cards. Can be used with all other 3505 features. Field Installation: Not recommended.

Optical Mark Read (#5450): For reading up to 40 columns of marked data. Marked and/or punched-hole data can be read from a card. Columns in which marks are unacceptable are transmitted as Hex '3F' characters. Same validity checking applies as for holes. Can be used in Card Image Mode, in which case the validity check is suspended. Note: See GA21-9124 for card and format specifications. It is recommended that Selective Stacker (#6555) be installed for program-selecting poorly marked cards. Limitations: Cannot be used simultaneously with the Read Column Eliminate function. Field Installation: Yes.

Selective Stacker (#6555): Provides a third stacker (second logical stacker), which permits time-independent card selection under program control. Card capacity is 1,750 cards. When actually using this feature under DOS, the maximum speed of mdl B2 on the 3115 or 3125 is approximately 1,150 cards/minute. Field Installation: Yes.

3525 Card Print Control (#8100): Provides control for Basic Card Print (#1421) installed on a 3525 Card Punch. Field Installation: Yes. Prerequisites: Either #8103 or #8105. Specify: Either #9791 for two-line, or #9792 for multiline. Limitations: Cannot be installed with Katakana Card Print Control (#2707).

3525 Punch Adapter (#8103): Permits attachment of the 3525 Card Punch without Card Read (#1533). Limitations: Cannot be installed with #8105. Field Installation: Yes.

3525 Read Punch Adapter (#8105): Permits attachment of the 3525 Card Punch equipped with Card Read (#1533). Limitations: Cannot be installed with #8103. Field Installation: Yes.

MODEL CONVERSIONS

Field installable.

ACCESSORIES (None)

SUPPLIES (None)

MACHINES

3525 CARD PUNCH
PURPOSE

Punched card output unit for a S/360 mdl 195, any S/370 processor, any 30XX processor, 4331 or 4341 Processor.

MODELS

		Rated 80-column Card Speed
Model P1	P01	100/minute
Model P2	P02	200/minute
Model P3	P02	300/minute

Maximum: S/360 mdl 195 and any S/370 (except mdl 125), 30XX, 4300 processor: One 3525 can be attached via each 3505 Card Reader mdl B1 or B2. S/370 mdl 125: One 3525 can be natively attached via the appropriate adapter on the 3125 ... see M3125 pages.

Prerequisites: S/360 mdl 195 and any S/370, 30XX, 4331 or 4341 processor: A 3505 Card Reader mdl B1 or B2 with a 3525 Punch Adapter (#8103), or 3525 Read Punch Adapter (#8105). S/370 mdl 125: Native attachment via the Integrated 3525 Card Punch Attachment (#4685) on the 3125.

HIGHLIGHTS

The 3525 is a full-function card punch which, when equipped with the appropriate special features, can read and/or print as well as punch 80-column cards in a single pass through the machine. The 3525 attaches natively to a S/370 mdl 125, or via (and within 20 feet of) a channel-attached 3505 Card Reader mdl B1 or B2 to a S/360 mdl 195, or any S/370, 4300 processor ... see "Prerequisites" above.

The basic unit has a 1,200 card capacity hopper and two 1,200 card capacity stackers. Either the EBCDIC (256 codes) or Card Image (Data Mode 2) can be punched. Punches parallel, row by row. Cards go to stacker 1 unless program directed to stacker 2.

Card punching is checked by monitoring the movement of all 80 punches. A card in which a punching error is detected is automatically directed to a dedicated 200-card capacity error stacker and followed by two automatic punching retries ... the first prepunched card is directed to the error stacker for analysis purposes ... the second prepunched card is directed to the stacker originally selected for the error card. **Note:** Because of automatic punch retry, it is recommended that prepunched or serially numbered preprinted cards not be used in a punch-only mode. When operating in a read/punch mode ... see Card Read in "Special Features" ... detected punching errors do not result in an automatic punching retry and prepunched or serially numbered preprinted cards can be used. In a read/punch mode, a detected punching error causes the machine to stop and manual error recovery procedures are required.

Card Limitations: Generally, special feature cards require careful handling and a favorable environment. Use of the following has been approved:

Internal Scores (before separation): M-4, M-5, OM-2, OM-3, ID-1, ID-2, ID-3 and S-1. When reading cards with internal OM-2 or OM-3 scores (Card Read feature installed), either reading must be terminated prior to the column that is scored, or reading of the scored column and the two adjacent columns must be suppressed by means of the program-controlled read-column-eliminate feature function provided standard with Card Read. S-2 may be used prior to folding, and after folding if the card is properly flattened.

External Scores (after separation): Column 1 and 80 end: M-3, M-4, M-5, M-6, M-7, M-11, OM-2, CF-4 and CF-11. Column 1 end only: OM-3. 12 and 9 edge: CF-1/9A.

Corner Cuts (any corner): C1, C2, C3 and C5.

Card Stock: Regular, edge-coated, and heavy duty.

Port-A-Punch®: Can be punched in unscored fields of the card. Scored columns of these cards cannot be read. If reading capability is required, contact IBM.

All other special feature cards may result in unsatisfactory performance and should be tested in an actual application prior to being recommended.

Publications: S/360 -- GC20-0360, S/370, 4300 -- GC20-0001

- Machine Nomenclature: #2927 for English, #2928 for French, #2929 for German, #2930 for Japanese, #2931 for Spanish, #2932 for Italian.
- Print Character Set: Required when Basic Card Print (#1421) is ordered. See "Type Catalog" pages for details.
#2974 Japan #2958 UK
#2961 Spanish Speaking

SPECIAL FEATURES

Basic Card Print (#1421): Provides a print station following the punch station. Print mechanism consists of a print chain, 64 hammers, and a card stepping device. **Field Installation:** Not recommended. **Prerequisites:** #8100 or #2707 on 3505 or #4693 on 3125. Also requires #8339 or #5273 or #2861 on 3525.

Card Read (#1533): Provides an optical hole-sensing station ahead of the punch station. Permits cards to be read in EBCDIC (Data Mode 1) or Card Image (Data Mode 2). Cards are read in parallel fashion (row by row) while the previous card is being punched. Data read is fully buffered and can be used to control later operations on the same card such as punching, printing, and stacker selection.

Read-column-eliminate is standard with the feature. Provides the ability, under program control, to suppress the reading of selected card columns. May be used to prevent reading in columns that could cause validity and read checks due to invalid codes or open-punched card scores. See Port-A-Punch under "Card Limitations" for restrictions. **Field Installation:** Yes. **Prerequisites:** #8105 on the 3505 mdl B1 or B2, or #9794 on the 3125.

Two-Line Katakana Card Print (#2861): [Japan] Identical in function to Multiline Katakana Card Print (#2862) with the exception that printing is limited to lines 1 and 3 (above the 12 punching row and between rows 12 and 11). Maximum speed in Cards/minute depends upon the machine mdl and the number of lines printed. Speeds are as follows:

3525 Card Punch (cont'd)

	P1	P2	P3
1 line	100 cpm	200 cpm	240 cpm
2 lines	100 cpm	133 cpm	171 cpm

Limitations: Cannot be installed with #8339, #5273, or #2862.
Prerequisites: #1421. **Field Installation:** Yes.

Multiline Katakana Card Print (#2862): [Japan] This feature is similar to the Latin-based Multiline Card Print feature (#5273) except that a 127-graphic set (including space) is provided. See "Type Catalog" pages for detailed information. Maximum speed, in cards/minute when printing, is dependent upon the machine mdl, the average number of lines printed, and the location of the printed lines. Typical speeds are as follows:

	P1	P2	P3
1 Line	100 cpm	200 cpm	240 cpm
2 Lines	100 cpm	133 cpm	171 cpm
3 Lines	67 cpm	100 cpm	109 cpm
4 Lines	57 cpm	89 cpm	92 cpm
6 Lines	45 cpm	62 cpm	67 cpm
10 Lines	33 cpm	42 cpm	43 cpm
25 Lines	17 cpm	18 cpm	18 cpm

Limitations: Cannot be installed with #8339, 5373, or #2861.
Prerequisites: #1421. **Field Installation:** Yes.

Multiline Card Print (#5273): Provides the ability to print, under program control, on any or all of 25 printing lines on the card. Each print line is 64 characters long and print locations are identical to that of the 2560 MFCM. Maximum speed, in cards/minute, when printing, is dependent upon the machine mdl, the average number of lines printed and the location of the printed lines. Typical speeds are as follows:

	P1	P2	P3
1 Line	100 cpm	200 cpm	300 cpm
2 Lines	100 cpm	200 cpm	240 cpm
3 Lines	67 cpm	133 cpm	150 cpm
4 Lines	67 cpm	114 cpm	133 cpm
6 lines	57 cpm	89 cpm	100 cpm
10 Lines	44 cpm	62 cpm	67 cpm
25 Lines	24 cpm	29 cpm	30 cpm

Limitations: Cannot be installed with #8339or #2862. **Field Installation:** Yes. **Prerequisites:** #1421. Also see "Specify" above for specifying the desired character set.

Two-Line Card Print (#8339): Identical in function to Multiline Card Print (#5273) with the exception that printing is limited to lines 1 and 3 (above the 12 punching row and between rows 12 and 11). Maximum speed in cards/minute, when printing, depends upon the machine mdl only. Speeds are as follows:

	P1	P2	P3
1 line	100 cpm	200 cpm	300 cpm
2 lines	100 cpm	200 cpm	300 cpm

Limitations: Cannot be installed with #5273or #2862. **Field Installation:** Yes. **Prerequisites:** #1421. Also see "Specify" above for specifying the desired character set.

MODEL CONVERSIONS

Field installable.

ACCESSORIES (None)

SUPPLIES (None)

3601 FINANCE COMMUNICATION CONTROLLER

THE 3601 IS NO LONGER AVAILABLE

PURPOSE

A programmable controller for attachment of 3600 Finance Communication System terminals to

S/34 or S/36 (using the appropriate licensed programs), S/3 model 15 processors or to S/370, 303X, 308X, 3090 or 4300 processors using appropriate virtual storage system control programs; or for attachment of certain 4700 Finance Communication System terminals to S/370, 303X, 308X, 3090 or 4300 processors using appropriate virtual storage system control programs, a 3602 Finance Communication Controller, S/34 or S/36 (using the appropriate licensed programs, or an 8100 Information System using DPPX licensed programs.

Attachment to S/34 is via SDLC transmission over various common carrier- or user-owned facilities.

Attachment to S/3 model 15 is via Binary Synchronous Communications (BSC) - see 3601/3602 RPQ 8K0598 and 8K0623 and 5415 RPQ S40156.

S/370, 303X, 308X, 3090, 4331, 4341, 4361 or 4381 processor attachment is via a 3704, 3705, or 3725 Communications Controller using synchronous data link control (SDLC) transmission over various common carrier or user-owned transmission facilities. Attachment is also possible via the Communications Adapter feature on a 4331 or 4361. See M 4331 or 4361 pages for details.

Note: See "Programming" and "SCP" pages for attachment capability.

8100 Information System attachment is via the 8130, 8140 or 8101 units using SDLC transmission protocols over various common carrier or nonswitched transmission facilities. Attachment to a System/34 or System/36 is via communication adapter using SDLC transmission protocol over various common carrier facilities. Attachment to a 3602 is via the Fan-Out Communication Feature. See M3602 pages for details.

MODELS

(NO LONGER AVAILABLE)

Model 1 001: A programmable controller with a diskette drive which accommodates 1-sided removable diskettes, a maximum of six loops and a maximum of 56K bytes of user programmable storage.

Remote terminal attachments* are available.

Note: Mdl 1 not for S/34 or S/3.

Model 2A A02: A programmable controller with a diskette drive which accommodates 1-sided removable diskettes, a maximum of three loops, and a maximum of 120K bytes of user programmable storage.

Remote terminal attachments* are available.

Model 2B B02: A programmable controller with a diskette drive which accommodates 1- or 2-sided removable diskettes, a maximum of three loops, and a maximum of 120K bytes of user programmable storage.

Remote terminal attachments* are available.

Model 3A A03: A programmable controller with a maximum of two diskette drives which accommodates 1-sided removable diskettes, a maximum of six loops, and a maximum of 120K bytes of user programmable storage.

Remote terminal attachments* and a Local device cluster attachment are available.

Model 3B B03: A programmable controller with a maximum of two diskette drive which accommodates 1- or 2-sided removable diskettes, a maximum of six loops and a maximum of 120K bytes of user programmable storage.

Remote terminal attachments* and a Local cluster attachment are available.

* Remote terminal attachments can be achieved on total number of loops indicated by one or a combination of the following as applicable:

Device or Feature	Device or Feat. #	3601				
		1	2A	2B	3A	3B
1200 bps Loop						
Int Modem	#8001	5	-	-	5	5
Terminal						
Attach Unit	3603-2,3	6	3	3	6	6
CCITT Interface	RPQ	5	2	2	5	5

Prerequisites: Communications Controller equipped with appropriate features (see M3704, 3705, 3725 or 4331 pages for Communications Adapter feature #1601 on the 4331 Processor), or via an 8100 Information System equipped with appropriate features (see M8130, 8140 and 8101 pages), or via S/34 or S/36 with appropriate features (see M5340, 5360 or 5362 pages).

HIGHLIGHTS

Controls all the functions of 3600 Finance Communication System terminals. Controls data transmission between those terminals and the central processing site. Four SDLC Communications features are available, one of which is required for transmission to and from the Host. An SDLC Communications feature at speeds from 1200 bps to 4800 bps or an SDLC Communications (mdl 3A or 3B for System/34 or System/3) feature at speeds from 1200 bps to 9600 bps can be selected. Besides host link speed differences, the SDLC feature to 9600 bps allows a maximum controller aggregate bps rate of 12,000 bps for the loops independent of the host link speed. See "Communications Features". For S/34 and S/3, for Binary Synchronous Communications (BSC) - see 3601/3602 RPQs 8K0598 and 8K0623.

Mdl 1: Contains approximately 24K bytes of programmable storage. Four additional increments of 8K bytes of programmable storage (for a total of 56K) are available. The amount of programmable storage available for application programming depends upon the attached terminal configuration and user environment. See Add'l Storage Feature (#1005).

Mdls 2A, 2B, 3A and 3B: Contain approximately 24K bytes of programmable storage. Six additional increments of 16K bytes or three increments of 32 bytes of programmable storage (for a total of 120K) are available. The amount of programmable storage available for application programming depends upon the attached terminal configuration and user environment. (See Add'l Storage Feature, #1006 or #1007.) For S/34 or S/3, specify #9591 for Control Storage, specify #9592 for User-Programmable Storage.

Mdls 1, 2A and 3A: House a direct access diskette drive with a 1-sided removable diskette which provides permanent storage for control and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). The mdl 3A allows the attachment of two 1-sided diskette drives.

Mdls 2B and 3B: House a direct access diskette drive with a 2-sided removable diskette which provides permanent storage for control and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). The mdl 3B allows the attachment of two 2-sided diskette drives.

All 3600 system terminals are attached by loops which operate at speeds of 1200, 2400 or 4800 bps for locally attached terminals and at 1200 and 2400 bps for remotely attached terminals (for the 3601 mdl 1, the speeds are 600 or 1200 bps). The base unit provides one loop. Two additional loops are available on mdls 2A and 2B while five additional loops are available on mdls 3A and 3B. 1200 bps loop integrated modems are available on mdls 1, 3A and 3B only. See "Special Features"

Note: Either one or two 4800 loops per 3601 may be specified.

The device cluster adapter feature may be attached to the 3601 mdls 3A and 3B.

For the S/34 and S/3:

Communication between the controller and the host may be through an external modem with interface (#3701), or 1200 bps Integrated Modem (#5500). See "Modems" and "Special Features" below. Each 3601 operates in half-duplex mode. Duplex communication line operations are possible with multiple 3601s attached to the line (one 3601 transmitting while the other receives).

For attachment to System/3 mdl 15 - see 3601/3602 RPQs 8K0598 and 8K0623 and 5415 RPQ S40156.

Can be programmed to operate independently when the CPU is unavailable. Capable of controlling all terminal functions, executing arithmetic, and capturing data from the terminals for later transmission to the CPU. A keylock is provided for the removable diskette. One key is provided.

For the 3600 or 4700:

Communication between the 3601 and the 3704, 3705, 3725, or the Communications Adapter (#1601) feature on the 4331 Processor or 8130, 8140, 8101 may be either through the 1200 bps Integrated Modem (#5500) on the 3601 or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656) or through an external modem using the interface (#3701) on the 3601 at speeds up to 9600 bps. Local attachment can be made to a 3704, 3705, or 3725 via its local attachment feature using #3701 on the 3601 at 1200 or 2400 bps. Local attachment can be made to a 4331 via its local attachment feature using #3701 on the 3601 at 1200, 2400, 4800 or 9600 bps. See "Modems" and "Special Features" below. Local attachment to a controlling 3602 at 9600 bps is via its Fan Out Communication Adapter Feature (#1551). Each 3601 operates in half-duplex mode. Duplex communication line operations are possible with multiple 3601s attached to the line, one 3601 transmitting while the other receives.

Can be programmed to operate independently when the S/370, 303X, 308X, 3090, 4300 Processor, controlling 3602, or 8100 Information System is unavailable. Capable of controlling all terminal functions, executing arithmetic, and capturing data from the terminals for later transmission to the S/370, 303X, 308X, 3090 or 4300 Processor, controlling 3602, or 8100 Information System.

A keylock is provided for the removable diskette. One key is provided.

Transmission: The 3601 operates over common carrier-provided or equivalent customer-owned communications facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating at speeds up to 9600 bps may be used with SDLC features.

Modem	Speed (bps)	Facility
3863	2400	Switched or nonswitched voice-grade lines
3868-1	2400	Nonswitched voice-grade line
3864	4800	Switched or nonswitched voice-grade lines
3868-2	4800	Nonswitched voice-grade

3865	9600	line Nonswitched voice-grade
3868-3,4	9600	line Nonswitched voice-grade
3872	2400	line Switched or nonswitched
3976-3	1200	voice-grade lines Nonswitched voice grade
5979		lines
L11/L12	9600	Limited distance COAM line

Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. See M2700 pages for further information.

Note: Switched line operation is not supported by the 3601/3602 integrated 1200 bps modem.

Publications: GC20-0370 -- IBM S/370 Bibliography and GC27-0001 -- IBM 3600 Finance Communication System, System Summary.

SPECIFY

Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V without plug #9901
123.5V #2811	115V Locking Plug #9880
220V #2813	115V Non-locking plug #9881
235V #2814	

Field Installation: Not recommended

Machine Nomenclature:

Canadian	French	#2935	Italian	#2932
English		#2927	Japanese	#2930
French		#2928	Spanish	#2931
German		#2929		

Field Installation: Not recommended.

Controller Designation: Media distribution of Controller Data. Specify #9491 to identify the initial 3601 or 3602 ordered for use with a host system location, or specify #9492 to identify additional 3601s per host system.

If #9491 is specified for the 3601, specify: #9494 if there is no 3614/3624 with a first position designator attached to any 3601 on the same host system, or ... #9493 if there is a 3614, with a first position designator and #9002, attached to any 3601 on the same host system, and/or ... #9495 if there is a 3614 with a first position designation and #9001 or a 3624 with a first position designator attached to any 3600 Controller on the same host system or if encryption capability via the Data Encryption Standard (DES), is desired on any 3600 Controller in the system. See 3614 Host Attachment Designation under "Specify" for the 3614, or Controller-Data Designation under "Specify" for the 3624.

If #9491 is specified, select the specify number of the desired media.

#9412	9/800 Magnetic Tape
#9413	9/1600 Magnetic Tape
#9414	9/6250 Magnetic Tape

If magnetic tape is not available on designated CPU, then select one of the following media. (DOS/VS users only)

#9431	80-Column Cards
#9432	96-Column Cards

If card or tape inputs are not available at the host location, contact IBM.

When feature #9491 is specified, additional shipping information is required.

Supplementary Specifications (via MES entry) are to be entered exactly as follows to indicate shipping address of the HOST SYSTEM LOCATION.

Line 1 -- IBM Programming Support Representative (PSR)
Line 2 -- C/O (Name of customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 -- City,
Country, Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered with #9491. Whenever controller data is updated by an EC, it will be shipped to the most current TPC address.

Caution: Specify code #9491 is used to provide Controller Data Media for only the initial 3601 or 3602 attached to a host system location. Do not specify #9491 for more than one 3601 or 3602 per host system as this will result in the unnecessary shipment of multiple DTR tapes or cards to the host system location.

- Cables: See "Accessories" for ordering instructions. Also see "Installation Manual - Physical Planning", GA27-2766.
- If ordering a 3614 or 3624 with 1st position designator (see Host Attachment Designation under "Specify" for the 3614, or Controller-Data Designator under "Specify" for the 3624) to be added to any existing 3601, an MES order transaction should be used against the initial controller (3601 or 3602 with #9491 and #9494) requesting to delete #9494 and add #9493 and/or #9495 for the initial controller.

Refer to IBM for further explanation of these specify codes and their use when (1) ordering a loop-attached 3614 in a network where no 3614s are previously attached, and (2) field installation of #9001 on a loop-attached system.

If all installed or on order 3614s or 3624s for loop attachment to the 3601 are removed or cancelled, an MES order transaction should be used against the initial controller (3601 or 3602 with #9491 and #9493 and/or #9495 requesting to delete #9493 and/or #9495 and add #9494 for the initial controller.

Note: The following specify features are field installable: #9412, #9413, #9414, #9431, #9432, #9491, #9492, #9493, #9494, #9495.

SPECIAL FEATURES

Non-Communications Features

Add'l Storage Feature (#1005): (Mdl 1) Provides an additional 8,192 bytes of control storage for device attachment or an additional 8,192 bytes of user-programmable storage. Specify: #9581 for Control Storage for Device Attachment. Any combination of device types: 3603, 3604, 3606, 3608, 3610, 3611, 3612, 3614, 3615, 3616, 3618, 4704 mdl 1, 4710, 4720, , 4723 and/or 3624 may be attached. Some combinations will require an optional 8,192 bytes of control storage provided by the use of feature #1005. To determine if #1005 is required, refer to the "Device Attachment Table - A" below. Calculate the sum of the attachment factors for the combination of devices to be attached. Add the attachment factor one time only for each device type. If the attachment factor sum is 3 or less, feature #1005 and #9581 are not required. If the attachment factor sum is greater than 3 but does not exceed 11, #1005 and #9581 are required. If the sum is greater than 11, but does not exceed 14, two #1005s and two #9581s are required. An attachment factor of greater than 14 is not allowed.

Note: Device Attachment table A is applicable to Controller data EC levels prior to EC749167.

Device Attachment Table - A

Device Type/ Feature/Function	Attachment Factor
3604, 4704 mdl 1	0
Mag. Stripe Encoder- Reader (#4905/#4906)	0.6
3606	3.0
3608	5.8
3610, 3611 and/or 3612	2.4
3614 (with AET only)	2.2
3618	3.0

If additional function is required, or Controller data EC749167 or later is installed, utilize Device Attachment Table - B to determine if #1005 is required. Calculate the sum of the attachment factors for the combination of devices or function required. Add the attachment factor one time only for each device type. If the attachment factor sum is 2 or less, neither #1005 nor #9581 is required. If the attachment factor sum is greater than two but does not exceed 10, #1005 and #9581 are required. If the sum is greater than 10, but does not exceed 14, two #1005s and two #9581s are required. An attachment factor of greater than 14 is not allowed.

Device Attachment Table - B

A description of attachment factor functions not associated with a specify, machine or feature is given later in this section (See "Attachment Factor Functions".)

Device Type/ Feature/Function	Attachment Factor
3603 or 3604 mdls 1-6, 4704 mdl 1	0
SDLC (#4501 or #4502)	0.7

3608 Printer (Note 9)	2.8
Mag Stripe Encoder-Reader	
(#4905/#4906) (Note 4)	0.7
Set Diskette	0.9
3604 mdl 7	0.5
4723 Doc Processor (Note 5)	3.6

Notes:

- Although both DES and AET may be included, a single 3614 may have either DES or AET but not both. A 3624 may have only DES.
- The optional instruction locator must be included if this function is used. If more than one function requiring the optional instruction locator is used, the attachment factor for the locator need be included only once.
- Any 3610, 3611 and 3612 combination constitutes one device type.
- The Magnetic Stripe Reader (#4901 or #4902) need not be considered in computing the attachment factor.
- Address sharing must be included if a 3616, 4704 mdl 1, 4710, or 4720 or 4723 is used. If more than one device/RPQ requiring address sharing is used, the attachment factor for address sharing need be included only once.
- Both 3616, 4710, 4720 Part 1 and 3616, 4710, 4720 Part 2 must be included when any one of these devices is used. Any 3616, 4710, 4720 combination constitutes one device type. The Part 1 and Part 2 attachment factors need only be included once if more than one device or device type is used.
- 3270/3600 Datastream Mapping must be included if the Extended 3270/3600 Keyboard Mapping is used.
- Address sharing must be included if a 3606 is used.
- Address sharing must be included if a 3608 is used. The 3606 must also be included only once to utilize both the 3608 Printer and keyboard/display.

Maximum: For #1005 with #9581 -- Two. Field Installation: Yes. Specify: #9581 for user-programmable storage Add'l Storage Feature (#1005) provides an additional 8,192 bytes of user-programmable storage. Maximum: For #1005 with #9582 -- Four. Field Installation: Yes.

Add'l Storage (#1006): Provides an additional 16,384 bytes of control storage for device attachment (mdls 2A, 2B, 3A and 3B only); or an additional 16,384 bytes of user-programmable storage (mdls 2A, 2B, 3A and 3B only). This additional storage can be used for the following four purposes:

- User-Programmable Storage,
- User-Programmable Storage Expansion,
- Control Storage, or
- Control Storage Expansion.

See below for description and limitations. Specify: #9591 for Control Storage, or #9592 for user-programmable storage.

Add'l Storage (#1007): (Mdls 2, 2B, 3A, 3B) Provides an additional 32,768 bytes of user-programmable storage. This additional storage can be used for (1) User-programmable storage, or (2) User-programmable storage expansion. See below for description and limitations. Specify: #9602.

- User-Programmable Storage: Used for configuration data and application programs.

Feature #1006, Specify #9592 - Provides an additional 16,384 bytes of user-programmable storage. Maximum: For #1006 with #9592 - Two. Field Installation: Yes.

Feature #1007, Specify #9602 - Provides an additional 32,768 bytes of user-programmable storage. Maximum: For #1007

with #9602 - One. Field Installation: Yes. Prerequisites: On controllers shipped prior to EC 745887, #6501 is required.

- User Programmable Storage Expansion: (Mdls 2A, 2B, 3A, 3B) Used in addition to two #1006 and two #9592 increments or one #1007 and one #9602 increment of user-programmable storage, described above, for the instruction sections of application programs and a limited amount of configuration data and application program constants. Most configuration data and application program constants cannot reside in expanded user-programmable storage.

Feature #1006, Specify #9592 - Provides an additional 16,384 bytes of user-programmable storage. Maximum: (For user-programmable storage plus user-programmable storage expansion): For #1006 with #9592 specified and with Storage Expansion Features (#6501) - six. Prerequisites: If more than two Add'l Storage Features (#1006) with #9592 are ordered, #6501 is required. Field Installation: Yes.

Feature #1007, Specify #9602 - Provides an additional 32,768 bytes of User Programmable Storage. Maximum: (for user-programmable storage plus user-programmable storage expansion) For #1007 with #9602 with Storage Expansion Feature (#6501) - three. Field Installation: Yes. Prerequisites: If more than one Add'l Storage Feature (#1007 with #9602) are ordered, or if in conjunction with any Add'l Storage Feature (#1006 with #9592), then #6501 is required.

- Control Storage: Used for attachment of any combination of device types/functions/features which have associated attachment factors. See "Device Attachment Table - C" below. Some combinations of device types can be accommodated with no further increments of control storage, while other combinations require additional increments of control storage.

Feature #1006, Specify #9591 (Mdls 2A, 2B, 3A, 3B) - Provides one increment of 16,384 bytes of Control Storage for device attachment.

Two additional increments, for a total of 3 are available with Control Storage Expansion (see below). To determine whether and how many control storage increments (#1006 with #9591) are required, refer to "Device Attachment Table - C" below. Calculate the sum of the attachment factors for the combination of devices and/or functions required. Add the attachment factor one time only for each device type, feature or function. If the attachment factor sum is 10 or less, feature (#1006 with #9591) is not required. If the attachment factor sum is greater than 10, feature (#1006 with #9591) is required. An attachment sum greater than 22 is not allowed in this base attachment factor calculation. Maximum (for control storage): For #1006 with #9591 -- One. Field Installation: Yes.

- Control Storage Expansion (CSE): (Mdls 2A, 2B, 3A, 3B) Feature #1006 with #9591. Provides a greater attachment factor capability for certain features or devices which require an attachment factor. CSE supplements the base attachment factor limit of 22 by providing second and third increments of additional storage. An additional attachment factor capability of 12 can be obtained by utilizing the second increment of #1006 with #9591 or 28 by utilizing the second and third increments of #1006 with #9591. Only the attachment factors associated with certain device types, features, or functions can be applied against this expanded attachment factor capability. (See "Device Attachment Table - C" below.)

While Control Storage Expansion provides additional attachment factor capability, the CSE attachment factor must be considered separately from the base attachment factor calculation. Specifically, the attachment factor for a given device or feature must be allocated against either the base or the expanded attachment factor but not both. Maximum (for Control Storage plus Control Storage Expansion): For #1006 with #9591 specified and with Storage Expansion Feature (#6501) -- Three. Field Installation: Yes. Prerequisites: If more than one #1006 with #9591 is ordered, then #6501 is required. Limitations: The maximum number of #1006s (whatever the combination of #9591 and #9592), is nine for controllers with serial numbers of 9770001 or higher, or if the controller is a recondi-

tioned unit incorporating EC 745887. For units with lower serial numbers, without EC 745887, the maximum number of #1006s is seven. The maximum number of #1006s commencing with units with EC 745887 is nine.

The maximum number of #1007s is three.

The maximum number of #1007 plus #1006 (whatever the combination of #9602, #9591, or #9592) for controllers shipped prior to 9770001 without EC 745887 is:

	Feature Code #1007	+	Feature Code #1006
Qty	3	+	1
Qty	2	+	3
Qty	1	+	5
Qty	0	+	7

The maximum number of #1007 plus #1006 for controllers with serial numbers 9770001 or higher, or reconditioned units with EC 745887 is:

	Feature Code #1007	+	Feature Code #1006
Qty	3	+	3
Qty	2	+	5
Qty	1	+	7
Qty	0	+	9

Device Attachment Table - C

In the following table, attachment factors in the column labeled "Base" are applicable to the base attachment factor calculation only. Attachment factors in the column labeled "Base or Expanded" are applicable to either the base or expanded attachment factor calculation.

The 3600 controller loads support for devices/features into control storage in the sequence indicated by the following table. Those RPQs with an attachment factor are also loaded in a prescribed sequence, as indicated in the IBM 3600 Finance Communication System Configurator (GA27-2762). The controller will always attempt to load each device, feature or RPQ into base control storage. If a device, feature or RPQ is encountered that will not fit into base control storage and it is applicable to extend control storage, the controller will attempt to load it into expanded control storage. The above algorithm must be used to determine control storage requirements.

Refer to the 3600 Finance Communication System Configurator, GA27-2762 for a comprehensive list of attachment factors and additional information regarding calculation of base and expanded attachment factors.

A description of attachment factor functions not associated with a specify, machine or feature is given later in this section: See "Attachment Factor Functions".

Device Type/ Feature/Function	Attachment Factor	Base Or Expanded

Notes:

- Although both DES and AET may be included, a single 3614 may have either DES or AET but not both. A 3624 may have only DES.

2. The optional instruction locator must be included if this function is used. If more than one function requiring the optional instruction locator is used, the attachment factor for the locator need be included only once.
3. Any 3610, 3611 and 3612 combination constitutes one device type.
4. The Magnetic Stripe Reader (#4901 or #4902) need not be considered in computing the attachment factor.
5. Address sharing must be included if a 3616, 4704 mdl 1, 4710, or 4720 or 4723 is used. If more than one device/RPQ requiring address sharing is used, the attachment factor for address sharing need be included only once.
6. Both 3616, 4710, 4720 Part 1 and 3616, 4710, 4720 Part 2 must be included if one of these devices is used. Any 3616, 4710, 4720 combination constitutes one device type. The Part 1 and Part 2 attachment factors need only be included once if more than one device or device type is used.
7. 3270/3600 Datastream Mapping must be concluded if extended 3270/3600 Keyboard Mapping is used.
8. The Device Cluster Adapter, 3262/3287/3289 Part 1, and 3287/3289 Part 2 must be included if a 3262, 3287 or a 3289 is used.

The attachment factor for the Device Cluster Adapter need be included only once if any combination of 3262, 3278-2, 3287 and 3289 is used.

The attachment factor for 3616, 4710, 4720 Part 2 and 3262/3287/3289 Part 1 need be included only once if more than one of these device types is used.
9. Both the Device Cluster Adapter and 3278-2 Attachment must be included if a 3278-2 is used.

The attachment factor for the Device Cluster Adapter need be included only once if any combination of 3262, 3278-2, 3287 and 3289 is used.
10. The EDAM Base must be included if the Allocate/Deallocate function is used.
11. The EDAM Base must be included if EDAM Temporary File Support is used.
12. Address sharing must be included if a 3606 is used.
13. Address sharing must be included if a 3608 is used. The 3606 must also be included only once to utilize both the 3608 Printer and keyboard/display.

Auxiliary Diskette Drive .25 Megabyte (#1025): (Mdl 3A) Provides approximately 280,000 bytes of additional diskette storage via two diskette drives. No area of the diskette to be mounted in the auxiliary (or secondary) drive will be reserved for the control program. Maximum: One. Field Installation: Yes.

Auxiliary Diskette Drive .5 Megabyte (#1035): (Mdl 3B) Provides approximately 560,000 bytes of additional diskette storage via two diskette drives. No area of the diskette to be mounted in the auxiliary (or secondary) drive will be reserved for the control program. Maximum: One. Field Installation: Yes.

Note: Support for #1025 and #1035 is provided by Extended Diskette Access Method (EDAM) Base, EDAM Allocate/Deallocate (LDKT instruction) and EDAM Temporary File Support. Refer to "Device Attachment Table - C" and "Attachment Factor Functions" section.

This feature requires replacement of the diskette storage device. Adequate provision must be made for retaining data contained on the diskette by having the user remove it prior to the installation of this feature.

Device Cluster Adapter (#3101): (Mdl 3A, 3B) Provides for the local attachment of a mix of 3278-2 display stations, 3287 printers, 3262-3, 13 Printers and 3289-1, 2 printers up to a maximum of eight

devices. When attaching the 3278-2 display station to the device cluster adapter, no-charge 3278 RPQ 8K0880 is required. Limitations: Maximum distance from controller to terminal is 610m (2,000 ft) using shielded twisted pair cable or 1,500m (4,920 ft) using coaxial cable. When the device cluster adapter is installed, Loop number four is no longer available. The maximum number of loops available on the 3601-3 is therefore reduced to five. Maximum: One. Field Installation: Yes.

Loop Feature, Add'l (#4735): Provides the ability to attach additional 3600 Finance Communication System terminals. Limitations: A maximum of two loops (including the provided local loop) operating at 4800 bps per 3601 are allowed when one of the SDLC communication features (#4501 or #4502) are specified. Otherwise, the maximum is one loop operating at 4800 bps (including the provided local loop). Loop Integrated Modem (#8001) cannot be installed on mdls 2A and 2B.

Note: The sum of the speeds of all loops in bits per second (bps) plus the speed of the SDLC link (#6301 or #6302) in bps cannot exceed 12,000 bps. When SDLC feature (#4501 or #4502) is installed, the sum of all loops cannot exceed 12,000 bps (do not use the host link speed).

Maximum: Two per mdls 2A and 2B. Five per mdls 1, 3A and 3B. Field Installation: Yes. Prerequisites: For each loop with any remotely attached terminals, 1200 bps Loop Integrated Modem (#8001) on a terminal or a 3603 is required.

600 bps Loop Integrated Modem (#5450): (Mdl 1) An integrated modem for communication with remotely located 3600 Finance Communication System terminals. Operates in a full-duplex mode at 600 bps over 2-wire, point-to-point, normal quality, voice grade lines. Maximum: One per Add'l Loop Feature (#4735). Field Installation: Yes. Prerequisites: #4735. Each remote location must have either a 3604 Keyboard Display mdl 2, 3 or 4 equipped with #5450, or a 3614 consumer Transaction Facility with #5450 as the first attached remote unit in each physical (geographic) location.)

Storage Expansion Feature (#6501): (Mdl 2A, 2B, 3A, 3B) Provides capability of (1) expanding user-programmable storage (#1006) with #9592 or #1007 with #9602 beyond 56K bytes, and/or (2) adding additional increments of #1006 with #9591, beyond 16K bytes. Limitations: If IR 4 and Controller Data ECs 745122 and 745123 are utilized, the controller will work properly with the Storage Expansion Feature (#6501) installed, but Control Storage Expansion cannot be utilized. If releases earlier than IR 4 and Controller Data ECs 745122 and 745123 are utilized, neither the Storage Expansion Feature (#6501) nor more than one Add'l Storage Feature (#1006) with #9591 should be installed. Maximum: One. Field Installation: Yes.

Note: #6501 is required when more than one Add'l Storage Features (#1006) with #9592 and/or when more than one Add'l Storage Feature (#1006) with #9591 are ordered. #6501 is required when more than one Add'l Storage Feature (#1006 with #9591), or more than two Add'l User-Programmable Storage Features (#1006 with #9592), or more than one Add'l Storage Feature or Add'l Storage Feature (#1007 with #9602) with User-Programmable Storage Feature (#1006 with #9592). Prerequisites: #6501 is a prerequisite for any #1007 on mdls 2A, 2B, 3A and 3B shipped prior to EC 745887.

COMMUNICATIONS FEATURES

Each 3601 must be equipped with one of the following SDLC features and either the CCITT Interface (#3701) or the 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656) for communication with the host processor.

CCITT Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages for communications to the host processor through the 3704, 3705, 3725, or the communications Adapter (#1601) feature on the 4331 Processor, or for communications to an 8100 Information System or for local attachment to the controlling 3602, 3704, 3705, 3725, or 4331 without requiring mod-

ems. See M3602, 3704, 3705, 3725, or 4331 pages for details. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. Limitations: Cannot be installed with a 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656). Maximum: One. Field Installation: Yes. Prerequisites: #6301 or #4501 ... or #6302 or #4502.

SDLC Communications Feature With Business Machine Clocking (#4501): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500), or any 1200 bps external modem which does not have internal clocking at 1200 bps or for local attachment to a 3704, 3705, or 3725 Communications Controller (#4716) at 1200 or 2400 bps. The SDLC link speed of this feature need not be included when calculating the sum of the speeds not to exceed the aggregate bps rate of 12,000 bps. Limitations: Cannot be installed with #6301, #6302 or #4502. Maximum: One. Field Installation: Yes.

SDLC Communications Feature Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which does have internal clocking at speeds up to 9600 bps. Also required for attachment to a controlling 3602 or for local attachment to a 4331 Processor (#4801) at 1200, 2400, 4800, or 9600 bps. The SDLC link speed of this feature need not be included when calculating the sum of the loop speeds not to exceed the controller aggregate bps rate of 12,000 bps. Limitations: Cannot be installed with #6301, #6302 or #4501. Maximum: One. Field Installation: Yes. Prerequisites: #3701, #5655 or #5656.

1200 bps Integrated Modem (#5500): An integrated modem for operation at 1200 bps over nonswitched half-duplex or duplex voice grade lines for communication to the processor through the 3704, 3705, 3725, or the Communications Adapter (#1601) feature on the 4331 Processor, or for communications to an 8100 Information System. Limitations: Cannot be installed with Interface (#3701) or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656). Maximum: One. Field Installation: Yes. Prerequisites: #4501 or #6301. Specify: #9651 for 4-wire strapping, or #9652 for 2-wire strapping.

(Japan only > X.21 Adapter For Nonswitched Networks (#5655): This feature provides an interface and 6 meter cable for attachment to an X.21 native nonswitched network with no changes to existing SNA/SDLC procedures for controlling nonswitched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for nonswitched point-to-point and multipoint communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. Limitations: Cannot be installed with #5500, #3701 or #5656. Available only on controllers with serial numbers 9770001 or higher or if the controller is a reconditioned unit incorporating EC 745887. Prerequisites: #6302 or #4502. <)

X.21 Adapter For Switched Networks (#5656): [AFE(Japan only <)] An interface adapter and 6m cable for attachment to the X.21 Switched Network. SDLC Communications at speeds of 2400, 4800 and 9600 bps are supported. Limitations: Cannot be installed with CCITT Interface (#3701), 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655). Available only on controllers with serial numbers of 9770001 or higher or if the units is a reconditioned unit incorporating EC 745887. Maximum: One. Field Installation: Yes. Prerequisites: #4502.

SDLC Communications Feature With Business Machine Clocking (#6301): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500), or any 1200 bps external modem which does not have clocking at 1200 bps, or for local attachment to a 3704, 3705, or 3725 Communications Controller (#4716) at 1200 or 2400 bps, or for communications to an 8100 Information System. Limitations: Cannot be installed with #6302, #4501 or #4502. Maximum: One. Field Installation: Yes.

SDLC Communications Without Business Machine Clocking (#6302): Required for attachment to communications lines through an external modem which does have internal clocking at speeds up to 4800 bps or for local attachment to a 4331 Processor (#4801) at

1200, 2400 or 4800 bps. Limitations: Cannot be installed with #6301, #4501 or #4502. Maximum: One. Field Installation: Yes. Prerequisites: #3701, #5655 or #5656.

1200 bps Loop Integrated Modem (#8001): (Mdl's 1, 3A, 3B) An integrated modem for transmission to remotely located 3600 Finance Communication System terminals. Operates at 1200 bps over non-switched normal quality voice grade lines.

Note: Several remote loop configuration variations can be realized; e.g., see the "IBM 3600 FCS Configurator", GA27-2762. However regardless of configuration, the interconnecting common carrier facilities are always point-to-point circuits; either 2-wire half-duplex or 4-wire duplex. The common carrier does not tariff 3600 "remote loops". The customer should be referred to the configurator or information in the M2 700 pages for definition of the tariffed elements of the remote loop.

Maximum: One per Add'l Loop Feature (#4735). Field Installation: Yes. Prerequisites: #4735. Each remote location must have either a 3604 Keyboard Display mdl 2, 3 or 4 equipped with #8001 or #8002, a 3614 consumer Transaction Facility with #8001 or a 3603 as the first attached remote unit in each physical (geographic) location.

MODEL CONVERSIONS

The following model changes are field installable:

	To	2B	3A	3B
From				
2A		x*	x	x*
2B			x	
3A				x*

* Requires replacement of the diskette storage device. Adequate provision must be made for retaining data contained on the diskette by having the user remove it prior to the start of any conversion. Field Installation: Yes.

Attachment Factor Functions

- Data Sequencing: Allows user application to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

- Set Diskette

Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

- Instruction Enhancements

Provides the user application with the following new instructions:

- Bit Manipulating
 - Test and Branch (LIFON, LIOFF) - Provides a test set, and branch function in a single instruction. This reduces the 3600 AP processing and memory requirements when processing single bits.
- Logical Compare Data Immediate (CCDI)
 - Compares immediate data to data in a specified field.
- Move Data Immediate (MVDI)
 - Moves immediate data to a specified field.
- Load Data Immediate (LDDI)
 - Loads immediate data into specified register.
- SCALE
 - Formats an input string of characters into a conveniently processable numerical format. When used in processing monetary input, functions such as the removal of the

monetary symbol, commas, and periods from the input data are automatically done. In the event that cents were not in the input data, zero padding is optionally provided. SCALE should significantly reduce the number of instruction required to process monetary input.

- Segment Indexing (SETX, TESTX, SETXREG)
Provides an alternate method of referencing data within a segment. Only fixed operands of 3600 instruction may be indexed. This function can be used to reduce the number of SETFPL instructions executed by the AP, thereby enhancing performance and reducing AP size. This function also provides a pseudo DSECT facility, thereby enabling an AP to more readily reference (1) variably displaced data within segments and/or (2) data beyond 4K bytes from the beginning of a segment.
- Branch on Index (BRANX)
Provides an index increment, compare and branch function in a single instruction. This instruction is used to control the number of times a series of AP instructions will be executed. Since the instruction algebraically increments a register, BRANX can be used in conjunction with the Segment Indexing facility to simplify the processing of tables.
- Execute (LEXEC)
Provides a function similar to the S/370 EXECUTE instruction. The amount of data logically ORed into the target instruction may be 2, 4 or 6 bytes.
- Priority Dispatching
Provides the ability to specify the order in which 3601/3602 workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP macro.
- Translate
The LTRT instruction processes an input data stream against user specifiable translate table(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).
- Extended Statistical Counter Recording
Provides the option to enhance statistical counter recording facilities to assist in fault isolation of degraded loop segments. This facility is particularly useful when a loop consists of multiple remote locations.
- Multiple Block I/O - Diskette
Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than 3 blocks are read or 4 blocks are written.
- 3270/3600 Datastream Mapping
Provides, via four new 3600 assembler language instructions, 3600 controller assistance in converting 3270 output display data streams into an output data stream processable by 3600 attached devices, and 3604 input data streams into 3270 input data streams. Input and output screen sizes are supported as specified by the application programmer. The 3270 Tab, Clear, PA and PF keys are simulated.
- Extended 3270/3600 Keyboard Mapping
Provides simulation of the 3270 Insert, Delete, Erase To End Of Field and Erase Input keyboard functions.
- LSEKIP Instruction

Locates a table entry which is "equal to" "greater than or equal to" or "less than or equal to" a search argument using a binary search algorithm. Table may be included in the instruction section of the controller application program, thereby permitting the tables to reside in expanded user programmable storage.

- SCRPAD Instruction
Provides access to optional global work areas distant from segment storage which may reside in base or expanded user programmable storage.
- Data Compression/Compaction
This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently occurring characters according to a user defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.
- Data Decompression/Decompaction
This function allows a controller application program to decompress and/or decompact a data stream which had previously been compressed and/or compacted by a host or a controller application program.
- Extended Diskette Access Method (EDAM) Base
Provides the capability to open, access (via the LREAD, LWRITE or REPLACE instructions) and close data sets on the primary or auxiliary diskette drive.
- EDAM Allocate/Deallocate (LDKT Instructions)
Provides the capability to allocate and deallocate data sets in either the primary or auxiliary diskette drive.
- EDAM Temporary File Support
Permits processing of a data set defined with a temporary file structure on the auxiliary diskette drive.
- INTMR Instruction
Permits the collection of elapsed time for events initiated and terminated by a controller application program.
- Extended LLOAD Instruction
Allows a controller application program to load data overlays into segments other than segment 14.
- Secondary Logical Unit (LU) Assignment
Allows a controller application program to change the logical unit address associated with a given workstation.

ACCESSORIES

Cables: IBM shielded twisted pair is required for attaching 3600 units. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation within your country.

Other applicable cable assemblies and associated accessories can be purchased from IBM. See "Physical Planning Manual", GA27-2766 for cable and connector specifications. Specify bulk number, cable assembly number or part number as appropriate. Allow a lead time of 120 days.

Item No.	Description	Length
1563155	Loop Cable	

MACHINES

4474809	Assembly Cable Assy (3609-2 to Modem)	609.6m (2,000') 2.08m (82 in)
1745372	Cable Assy (Loop Repeater to Loop Terminal Box)	7.62m (25 ft)
1745350	Cable Assy (3603 to Leased Lines)	7.62m (25 ft)
(Canada only>		
1745349	Cable Assy (DDA to 3603)	7.62m (25 ft)
1741656	Cable Assy (joining 2 telephone lines)	N/A<)
(Canada only>

5252763	Male Plug	
5252765	Female Plug	
5420242	Mini-Ty (used with 1745363)	

Locks and Keys: The 3601 is shipped with two keys. Additional keys may be purchased from IBM. Indicate serial number of lock.

Loop Repeater (P/N 4400002): Plugs into the Loop cable and re-drives all signals being transmitted in a 3600 Finance Communication System. Each Loop Repeater contains Loop re-driving capabilities which allow for the extension of the Loop cable length by 2,000 feet. Loop Repeaters may be employed on a Loop to extend its overall length to a maximum of 20,000 cable-feet. The unit can be physically mounted on a wall in an out-of-the-way location. Prerequisites: An operating 3600 System Local Loop or Remote Subloop. Publications: GC22-0005.

Customer Responsibilities

The customer may be advised that:

1. The customer is responsible for making certain that the use of the equipment complies with all Country and Local Laws, Regulations, and Ordinances.
2. The customer is responsible for price quotations, installation and cost (initial and recurring) of common carrier equipment and service.

3. The customer is responsible for the set-up of the unit.
4. The customer will determine the failing unit (see "Maintenance" below).
5. The customer is responsible for determining the required number of spares.

Physical Planning and Setup

Physical planning and setup is the responsibility of the customer. Attachment to the Loop cable is provided by ordering External Signal Cable Assembly (P/N 174372), or equivalent. (See IBM 3600 Finance Communication System Installation Manual - Physical Planning, GA27-2766.)

Spares

The customer may wish to replace a failing unit with a spare and must be advised to purchase sufficient spare units for such use. The number of spare units recommended is dependent upon the number of units the customer has installed, application requirements, physical locations and layouts. However, the minimum number of spare units recommended is shown in the following table:

Number of Loop Repeaters Installed	Minimum Number of Spares Recommended
100	2

Warranty

Service is available at the designated IBM Repair Center during the 90 day warranty period, which commences 30 days following date of shipment from the plant of manufacture (Raleigh). It shall be the customer's responsibility to set up the equipment. It shall be the customer's responsibility to determine the failing unit and remove it from the Loop, and if the unit is still under warranty, to pack it in the designated shipping container and ship it prepaid to the designated IBM Repair Center. IBM will return the serviced unit, shipping charges prepaid. There is no regularly scheduled preventive maintenance recommended by IBM on these units. Maintenance agreements are not available. CE on-site service will not be provided.

Ordering

Order P/N 4400002.

Diskettes: The following diskettes may be obtained by contacting IBM.

Diskette 1 (single-sided) 3601/3602

Byte Format	Part Number
256	2305845
128	2305830

Diskette 2 (double-sided) 3601-2B/3B,
3602-1A/2A

Byte Format	Part Number
256	2736700
128	1766870

SUPPLIES (NONE)

3602 FINANCE COMMUNICATION CONTROLLER

[NO LONGER AVAILABLE as of October 1984. Model changes, Features, RPQs and Accessories are available.]

PURPOSE

A programmable controller for attachment of 3600 Finance Communication System terminals to System/34 and System/3 model 15 processors and for attachment of 3600 Finance Communication System terminals or certain 4700 Finance Communication System terminals and the 3694 Document Processor to S/370, 303X, 308X, 3090 or 4300 processors using appropriate virtual storage system control programs or an 8100 Information System using DPPX licensed programs.

Attachment to System/34 is via SDLC transmission over various common carrier or user-owned facilities.

Attachment to System/3 model 15 is via Binary Synchronous Communications (BSC) - see 3601/3602 RPQs 8K0598 and 8K0623 and 5415 RPQ S40156.

S/370, 303X, 308X, 3090 or 4300 Processor attachment is via a 3704, 3705, or 3725 Communications Controller or the Communications Adapter (#1601) feature on the 4331 Processor using Synchronous Data Link Control (SDLC) transmission over various common carrier or user-owned transmission facilities. 8100 Information System attachment is via the 8130, 8140 and 8101 units using SDLC transmission protocols over various common carrier or nonswitched transmission facilities.

Note: See "Programming" and "SCP" pages for attachment capability.

MODELS

Model 1A A01 A large-file programmable controller with a 5.2 meg (floating head) disk, a drive which accommodates 1- or 2-sided removable diskettes, 16K or 32K increments of storage, and a maximum loop capability of eight, of which seven can be remote.

Model 1B B01 A large-file programmable controller with a 9.3 meg (floating head) disk, a drive which accommodates 1- or 2-sided removable diskettes, 16K or 32K increments of storage, and a maximum loop capability of eight, of which seven can be remote.

Prerequisites: Communications with a S/370, 303X, 308X, 3090 or 4300 processor with virtual storage capability via 3704, 3705, or 3725 Communications Controller equipped with appropriate features or the Communications Adapter (#1601) feature on the 4331 Processor (see M3704, 3705, 3725, or 4331 pages) or via an 8100 Information System equipped with appropriate features (see M8130, 8140 and 8101 pages).

HIGHLIGHTS

Controls all the functions of the 3600 Finance Communication System or certain 4700 Finance Communication System terminals. Controls data transmission between those terminals and the central processing site. Four SDLC Communication features are available, one of which is required for transmission to the host. An SDLC Communications feature at speeds of from 1200 bps to 4800 bps or an SDLC Communications feature at speeds of from 1200 bps to 9600 bps can be selected. Besides host link speed differences, the SDLC feature that is used at 9600 bps allows a maximum controller aggregate bps rate of 12,000 bps for the loops independent of the host link speed ... see "Communication Features". For Binary Synchronous Communications (BSC), see RPQs 8K0598 and 8K0623.

Contains approximately 24K bytes of programmable storage. Six additional increments of 16K bytes or three increments of 32K bytes of programmable storage (for a total of 120K) are available. The amount of programmable storage available for application programming depends upon the attached terminal configuration and user environment ... see Add'l Storage (#1006 or #1007) under "Special Features".

Houses a direct access diskette (contact head) drive with 2-sided removable diskette which provides permanent storage for control and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). (Canada only) With Auxiliary Diskette Drive .5MB (#1015), the 3602 permits attachment of two 2-sided diskette drives. +)

Houses a floating head disk storage device for storage of user data. This storage device is not removable except by service personnel. Includes a fixed head feature which will provide eight additional heads with access to disk data on eight tracks ... see Add'l Disk Heads (#1010, #1011) under "Special Features".

All 3600/4700 system terminals (except 4704 mdl 2 and 3) are attached by loops which operate at speeds of 1200, 2400 or 4800 bps for locally attached terminals and at 1200 or 2400 bps for remotely attached terminals. The base unit provides one loop. Seven additional loops are available. Integrated modems are available on both mdl ... see "Special Features". Note: Either one or two 4800 bps loops per 3602 may be specified. Note: Only one 4800 bps loop per 3602 may be specified for System/3 Host attachment.

(Canada only+)

Can serve as a cluster controller for attachment of the 3600 Controllers, attachment of 3662 or 3287 Printers for full-page high-speed printing or attachment of 3278 mdl 2 Display Stations. +)

Communication between the controller and the 3704, 3705, or 3725 or the Communications Adapter (#1601) feature on the 4331 Processor or 8130, 8140, 8101 may be either through an integrated 1200 bps modem or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656) or through an external modem using Interface (#3701) on the 3602. Local attachment can be made to a 3704, 3705, 3725 or the Communications Adapter (#1601) feature on the 4331 Processor via its local attachment feature using #3701 on the 3602 at 1200 or 2400 bps. Local attachment can be made to a 4331 via its local attachment feature using #3701 on the 3602 at 1200, 2400, 4800 or 9600 bps. See "Modems" and "Special Features" below. Each 3602 operates in half-duplex mode. Duplex communication line operations are possible with multiple 3601/3602s attached to the line ... 3602 transmitting while the other receives. For attachment to System/3 mdl 15, see 3601/3602 RPQ 8K0598 and 5415 RPQ S40156.

Can be programmed to operate independently when the processor is unavailable. Capable of controlling all terminal functions, executing arithmetic, and capturing data from the terminals for later transmission to the S/370, 303X, 308X, 3090 or 4300 processor or 8100 Information System.

Transmission: The 3602 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating speeds up to 9600 bps may be achieved with SDLC feature. External modems operating at up to 4800 bps may be attached when used with SDLC Feature #6301 or #6302. Speeds up to 9600 bps may be achieved with SDLC Feature #4501 or #4502.

Modem	Speed bps	Facility
3863	2400	Switched or nonswitched voice-grade lines
3868-1	2400	Nonswitched voice-grade lines
3864	4800	Switched or nonswitched voice-grade lines
3868-2	4800	Nonswitched voice-grade lines
3865	9600	Nonswitched voice-grade lines
3868-3,4	9600	Nonswitched voice-grade lines
3872	2400	Switched or nonswitched voice-grade lines
3976-3	1200	Nonswitched voice-grade lines
L11/L12	9600	Limited distance COAM line

See M2700 pages for further information. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy.

Note: Switched line operation is not supported by the 3601/3602 integrated 1200 bps modem.

Bibliography: IBM System/370 Bibliography, GC20-0370, and IBM 3600 Finance Communication System, System Summary, GC27-0001.

SPECIFY

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	208V #9902
220V #2813	230V #9904
235V #2814)	

Locking Plug

208V #9885
230V #9887

Field Installation: Not recommended.

3602 Finance Communication Controller (cont'd)

• Machine Nomenclature:

Canadian French #2935	Italian #2932
English #2927	Japanese #2930
French #2928	Spanish #2931
German #2929	

Field Installation: Not recommended.

- Controller Designation: Media distribution of Controller Data. Specify #9491 to identify the initial 3601 or 3602 ordered for use with a host system location, or specify #9492 to identify additional 3602s per host system.

If #9491 is specified for the 3602, specify:

- #9494 if there is no 3614 or 3624 with a first position designator attached to any 3602 on the same host system, or
- #9493 if there is a 3614 with a first position designator and #9002 attached to any 3602 on the same host system, and/or
- #9495 if there is a 3614 with a first position designator and #9001 or a 3624 with a first position designator attached to any 3602 on the same host system; or if encryption capability, via the Data Encryption Standard (DES), is desired in the 3600 Controller.

See 3614 Host Attachment Designation under "Specify" for the 3614.

If #9491 is specified, select the specify number of the desired media.

9/800 Magnetic Tape (#9412)
9/1600 Magnetic Tape (#9413)
9/6250 Magnetic Tape (#9414)

If magnetic tape is not available on designated processor, then select one of the following media (DOS/VS users only):

80-Column Cards (#9431)
96-Column Cards (#9432)

If card or tape inputs are not available at the host location, contact IBM for guidance. When feature #9491 is specified, additional shipping information is required. Supplementary specifications are to be stated exactly as follows to indicate shipping address of the host system location:

Line 1 -- IBM Programming Support Representative (PSR)
Line 2 -- C/O (Name of customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 -- City, Country, Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered with specify #9491. Whenever controller data is updated by an EC, it will be shipped to the most current TPC address.

Caution: #9491 is used to provide Controller Data Media for only the initial 3601 or 3602 attached to a host system location. Do not specify #9491 for more than one 3601 or 3602 per host system as this will result in the unnecessary shipment of multiple DTR tapes or cards to the host system location.

- Cables: See "Accessories" for ordering instructions. Also see *Installation Manual-Physical Planning*, GA27-2766.
- If ordering a 3614 or 3624 with first position designator (see Host Attachment Designation under "Specify" for the 3614, or Controller - Data Designation under "Specify" for the 3624) to be added to any existing 3602, an order transaction should be used against the initial Controller (3601 or 3602 with #9491 and #9494 requesting to delete #9494 and add #9493 and/or #9495 for the initial Controller.

If all installed or on order 3614s or 3624s for loop attachment to the 3602 are removed or cancelled,

a WTAAS order transaction should be used against the initial Controller (3601 or 3602 with #9491 and #9493 and/or #9495 requesting to delete #9493 and/or #9495 and add #9494 for the initial controller).

Refer to ZG76-0706 for further explanation of these specify codes and their use when (1) ordering a loop-attached 3614 in a network where no 3614s are previously attached, and (2) field installation of feature #9001 on a loop-attached 3614.

- The following specify codes are field installable: #9412, #9413, #9414, #9431, #9432, #9491, #9492, #9493, #9494, #9495.

SPECIAL FEATURES
NON-COMMUNICATIONS FEATURES

Add'l Storage (#1006): Provides an additional 16,384 bytes of control storage for device attachment or an additional 16,384 bytes of user-programmable storage. Additional storage can be utilized for the following purposes: (1) User-Programmable Storage, (2) User-Programmable Storage Expansion, (3) Control Storage and (4) Control Storage Expansion (see below for description and limitations). **Specify:** #9591 for Control Storage -- #9592 for User-Programmable Storage.

Add'l Storage (#1007): Provides an additional 32,768 bytes of User-Programmable Storage. Additional storage can be used for (1) User-Programmable Storage or (2) User-Programmable Storage expansion (see below for description and limitations). **Specify** #9602.

[1] User-Programmable Storage: Used for configuration data and application programs.

Feature #1006, specify #9592: Provides an additional 16,384 bytes of User-Programmable Storage. **Maximum:** for #1006 with #9592 -- two. **Field Installation:** Yes.

Feature #1007, specify #9602: Provides an additional 32,768 bytes of User-Programmable Storage. **Maximum:** for #1007 with #9602 -- one. **Field Installation:** Yes.

[2] User-Programmable Storage Expansion: Used in addition to two #1006 and two #9592 increments or one #1007 with one #9602 increment of User-Programmable Storage described above, for the instruction sections of application programs, and a limited amount of configuration data and application program constants. Most configuration data and application program constants *CANNOT* reside in expanded user-programmable storage.

Feature #1006, specify #9592: Provides an additional 16,384 bytes of User-Programmable Storage. **Maximum:** (for User-Programmable Storage plus User-Programmable Storage Expansion): For #1006 with #9592 and with Storage Expansion Feature (#6501) -- six. **Prerequisites:** If more than two additional Storage Features (#1006 with #9592) are ordered, #6501 is required. **Field Installation:** Yes.

Feature #1007, specify #9602: Provides an additional 32,768 bytes of User-Programmable Storage. **Maximum:** (for User-Programmable Storage plus User-Programmable Storage Expansion): For #1007 with #9602 and with Storage Expansion Feature (#6501) -- three. **Prerequisites:** If more than one Add'l Storage Feature (#1007 with #9602) is ordered, or if in conjunction with any Add'l Storage Feature (#1006 with #9592), then #6501 is required. **Field Installation:** Yes.

[3] Control Storage: Feature #1006, specify #9591. Used for the attachment of any combination of device types/functions/features, which have associated attachment factors (see "Device Attachment Table"). Some combination of device types can be accommodated with no further increments of control storage, while other combinations require additional increments of control storage provided by the use of feature #1006 with #9591. One additional increment of control storage is available without utilizing Control Storage Expansion. (Canada only+ Three +) (Except Canada+ Two +) additional increments, for a total of (Canada only+ four, +) (Except Canada+ three, +) are available with Control Storage Expansion. To determine whether and how many control storage increments (#1006 with #9591), refer to the "Device Attachment Table" (below). Calculate the sum of the attachment factors for the combination of devices or function required. Add the attachment factor one time only for each device type, feature, or function. If the attachment factor sum is 10 or less, feature #1006 or #9591 is not required. If the attachment factor sum is greater than 10, features #1006 and #9591 are required. An attachment factor greater than 22 is not allowed in this base attachment factor calculation.

[4] Control Storage Expansion (CSE): Feature #1006, specify #9591. Used to provide a greater attachment factor capability for those features or devices which require an attachment factor. CSE supplements the base attachment factor limit of 22 by providing second, third (Canada only+ and fourth +) increments of Add'l Storage (#1006 with #9591). An additional attachment factor capability of 12 can be obtained by utilizing the second increment of Add'l Storage, or 28 by utilizing the second and third increments (Canada only+ , or 44 by utilizing the second, third and fourth increments +) of Add'l Control Storage. Only the attachment factors associated with certain device types, features, or functions can be applied against this expanded attachment factor capability (see "Device Attachment Table" below). While Control Storage Expansion provides additional attachment factor capability, the

3602 Finance Communication Controller (cont'd)

CSE attachment factor must be considered separately from the base attachment factor calculation. Specifically, the Attachment Factor for a given device or feature must be allocated against either the base or the expanded attachment factor but not both. Maximum (for Control Storage plus Control Storage Expansion): For #1006 with #9591 and without #6501 ... one. For #1006 with #9591 and with #6501 ... (Canada only+ four +) (Except Canada+ three +). Limitations: The maximum number of #1006s (with any combination of #9591 and #9592) is (Canada only+ ten +) (Except Canada+ nine +). The maximum number of #1007s is three. Field Installation: Yes. Prerequisites: If more than one Control Storage Feature (#1006 with #9591) is ordered, the Storage Expansion Feature (#6501) is required.

The maximum number of #1007s plus #1006s, whatever the combination of #9602, #9591 or #9592, is:

	Feature Code #1007	+	Feature Code #1006
(Canada only+)			
Qty	3	+	4
Qty	2	+	6
Qty	1	+	8
Qty	0	+	10+)
(Except Canada+)			
Qty	3	+	3
Qty	2	+	5
Qty	1	+	7
Qty	0	+	9+)

In the following table, attachment factors in the column labeled 'Base' are applicable to the base attachment factor calculation only. Attachment factors in the column labeled 'Base or Expanded' are applicable to either the base or expanded attachment factor calculation.

The 3600 controller loads support for devices/features into control storage in the sequence indicated by the following table. Those RPOs with an attachment factor are also loaded in a prescribed sequence, as indicated in the *IBM 3600 Finance Communication System Configurator* (GA27-2762). The controller will always attempt to load each device, feature or RPO into base control storage. If a device, feature or RPO is encountered that will not fit into base control storage and it is applicable to expanded control storage, the controller will attempt to load it into expanded control storage. The above algorithm must be used to determine control storage requirements.

Refer to the *3600 Finance Communication System Configurator* (GA27-2762) for a comprehensive list of attachment factors and additional information regarding calculation of base and expanded attachment factors.

A description of attachment factor functions not associated with a specify, machine or feature is given later in this section: See "Attachment Factor Functions".

3608 Printer [Note 15]	-	2.8
Mag Stripe Encoder-Reader (#4905/#4906) [Note 4]	-	.7
Set Diskette	-	.9
3604 mdl 7	-	.5

Notes:

- Although both DES and AET may be included, a single 3614 may have either DES or AET but not both. A 3624 may have only DES.
- The optional instruction locator must be included if this function is used. If more than one function requiring the optional instruction locator is used, the attachment factor for the locator need be included only once.
- Any 3610, 3611 and 3612 combination constitutes one device type.
- The Magnetic Stripe Reader (#4901 or #4902) need not be considered in computing the attachment factor.
- Address Sharing must be included if a 3616, 4710, 4720 or 4704 mdl 1 is used. If more than one device/RPO requiring address sharing is used, the attachment factor for address sharing need be included only once.
- Both 3616, 4710, 4720 Part 1 and 3616, 4710, 4720 Part 2 must be included when any of these devices is used. Any 3616, 4710, 4720 combination constitutes one device type. The Part 1 and Part 2 attachment factors need only be included once if more than one device or device type is used.
- 3270/3600 Datastream Mapping must be included if the extended 3270/3600 Keyboard Mapping is used.

(Canada only+)

- The Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1, and SDLC/SNA Attachment Part 2 together comprise the SNA Primary Interface support required in the controlling 3602 for controller to controller (3600 to 3602) communication via an SNA/SDLC interface. When used, these functions must all be loaded into the same controller storage (i.e., Base or Expanded). This SNA primary function is used in conjunction with the Fan-Out Communication Adapter (#1551) and the SDLC Communications Feature Without Business Machines Clocking (#4502) with specify #9551 for Controller Attachment.
- The Alternative Line Attachment Base must be included and loaded into the same controller storage (i.e., Base or Expanded) if Dynamic Control is used.
- The Device Cluster Adapter, 3262/3287 Part 1, and 3262/3287 Part 2 must be included if a 3262 and/or 3287 is used. The attachment factor for the Device Cluster Adapter need be included only once if any combination of the 3278 mdl 2, or 3262/3287 is used. The attachment factor for 3616, 4710, 4720 Part 2 and 3262/3287 Part 1 need be included only once if more than one of these device types is used.
- Both the Device Cluster Adapter and 3278 mdl 2 Attachment must be included if a 3278 mdl 2 is used. The attachment factor

3602 Finance Communication Controller (cont'd)

for the Device Cluster Adapter need be included only once if any combination of 3278 mdl 2, 3262 or 3287 is used.

- [12] The EDAM Base must be included if the Allocate/Deallocate function is used.
- [13] The EDAM Base must be included if EDAM Temporary File Support is used.+)
- [14] Address sharing must be included if a 3606 is used.
- [15] Address sharing must be included if a 3608 is used. The 3606 must also be included to use the 3608 Keyboard/Display. Address sharing need be included only once to utilize both the 3608 Printer and Keyboard/Display.

Add'l Disk Heads (#1010, #1011): (#1010 for mdl 1A ... #1011 for mdl 1B.) Provides eight additional disk heads for the disk file as specified by mdl type selected. **Maximum:** One. **Field Installation:** Not recommended.

(Canada only+)

Auxiliary Diskette Drive (#1015): Provides approximately 560,000 bytes of additional diskette storage capacity via a second diskette drive. No area on the auxiliary (or secondary) drive will be reserved for the control program. **Maximum:** One. **Field Installation:** No **Note:** Support for feature #1015 is provided by Extended Diskette Access Method (EDAM) Base, EDAM Allocate/Deallocate (LDET) instruction, and EDAM Temporary File Support. Refer to Device Attachment Table and Attachment Factor Functions section. The EDAM function is not required to use the Auxiliary Diskette Drive feature. The level of support provided without EDAM is limited to direct (absolute) addressing at the track and sector level.

Fan-Out Communication Adapter (#1551): Required to attach 3600 System Controllers (3601/3602) to a controlling 3602. Up to nine controllers may be attached per feature. (See M3601 pages for features required on the attaching 3601s.) **Limitations:** (1) Can only be installed on 3602s with B/M 4406687 installed. (2) Attached controllers must be within 30.4m (100 cable-feet) of the 3602. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** Each Fan-Out Communications feature #1551 requires special feature SDLC Communications Without Business Machines Clocking (#4502) with specify #9551 for controller attachment. **Note:** Support for feature #1551 is provided by Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1 and SDLC/SNA Attachment Part 2. Refer to "Device Attachment Table", above.

Device Cluster Adapter - DCA (#3101): Provides for local attachment of a mix of up to eight 3262 or 3287 printers and 3278-2 display stations on a 3602. The number operable in a given application is dependent upon the user application program. When attaching the 3278 mdl 2 to the Device Cluster Adapter, no-charge RPO 8K0880 is required. **Limitations:** (1) Maximum distance from controller to terminal is 610 meters (2,000 feet) using shielded twisted pair-cable or 1,500 meters (4,920 feet) using coaxial cable. (2) When the Device Cluster Adapter is installed, loops number 4 and 8 are no longer available. **Maximum:** One. **Field Installation:** Yes.+)

Add'l Loop (#4735): Provides the ability to attach additional 3600 Finance Communication System terminals. **Limitations:** A maximum of two loops (including the provided local loop) operating at 4800 bps per 3602 are allowed when one of the SDLC communication features (#4501 or #4502) are specified (Canada only+ and Fan-Out Communications Adapter (#1551) is not specified +). Otherwise the maximum is one 4800 bps loop. **Maximum:** (Except Canada+ Seven. +) (Canada only+ Seven without #3101, five with #3101. +) **Field Installation:** Yes. **Prerequisites:** For each loop with any remotely attached terminals, #8001 or #8002 on a terminal, or a 3603 is required. **Note:** The sum of the speeds of all loops in bits per second (bps) plus the speed of the SDLC link (#6301 or #6302) in bps cannot exceed 12,000 bps (Canada only+ (each Fan-Out Communications Adapter (#1551) reduces the 12,000 bps limit by 1200 bps) +). When SDLC feature #4501 or #4502 (Canada only+ (without #9551) +) is installed, the sum of all loops cannot exceed 12,000 bps.

Storage Expansion (#6501): Provides capability of (1) expanding user-programmable storage (#1006 with #9592 or #1007 with #9602) beyond 56K bytes; and/or (2) adding additional increments of #1006 with #9591, beyond 16K bytes. **Limitations:** If IR 4 and Controller Data ECs 745122 and 745123 are utilized, the Controller will work properly with #6501 installed, but Control Storage Expansion cannot be utilized. If releases earlier than IR 4 and Controller Data ECs 745122 and 745123 are utilized, neither the Storage Expansion Feature (#6501) nor more than one Add'l Storage feature (#6501 with #9591) should be

installed. **Maximum:** One. **Field Installation:** Yes. **Note:** #6501 is required when more than 16K of additional control storage, Add'l Storage Feature (#1006 with #9591) or more than 32K of additional user-programmable storage, Add'l Storage Feature (#1006 with #9592) or Add'l Storage Feature (#1007 with #9602) are ordered.

COMMUNICATIONS FEATURES

Each 3602 must be equipped with one of the following SDLC features and either the EIA/CCITT Interface (#3701) or the 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656) for communication with the host processor.

EIA/CCITT Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, IOS Standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages for communications to the host processor through the 3704, 3705, 3725 or the Communications Adapter (#1601) feature on the 4331 Processor or for communications to an 8100 Information System or for local attachment to the 3704, 3705, 3725 or the Communications Adapter (#1601) feature on the 4331 Processor without requiring modems ... see M3704, 3705, 3725 or 4331 pages, feature #4716. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. **Limitations:** Cannot be installed with a 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655) or X.21 Adapter for Switched Networks (#5656). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301 or #4501 ... #6302 or #4502.

SDLC Communications With Business Machine Clocking (#4501): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500) or any 1200 bps external modem which does not have internal clocking or for local attachment to a 3704, 3705, or 3725 at 1200 or 2400 bps (#4716). The SDLC link speed of this feature need not be included when calculating the sum of the loop speeds not to exceed the controller aggregate bps rate of 12,000 bps. **Limitations:** Cannot be installed with #6301, #6302 or #4502 (unless #4502 has #9551 for controller attachment). +) **Maximum:** One. **Field Installation:** Yes.

SDLC Communications Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which does have internal clocking at speeds up to 9600 bps or for local attachment to a 4331 Processor (#4801) at 1200, 2400, 4800 or 9600 bps. The SDLC link speed of this feature need not be included when calculating the sum of the loop speeds not to exceed the controller aggregate bps rate of 12,000 bps. **Limitations:** (Canada only+ For host connection without #9551. +) Cannot be installed with #6301, #6302 or #4501. **Maximum:** (Canada only+ One for host connection (without #9551) plus two with #9551 for controller attachment. +) (Except Canada+ One. **Field Installation:** Yes. **Prerequisites:** #3701, #5655 or #5656 (Canada only+ when ordered without #9551 and Fan-Out Communication Adapter #1551 when order with #9551. +) (Canada only+ Specify: When used in conjunction with #1551 for attachment of 3601s, specify #9551. +)

1200 bps Integrated Modem (#5500): An integrated modem for operation at 1200 bps over nonswitched half-duplex or duplex voice grade lines for communication to a host processor through the 3704, 3705, 3725 or the Communications Adapter (#1601) feature on the 4331 Processor or for communications to an 8100 Information System. This integrated modem must communicate with another IBM 1200 bps Integrated Modem. **Limitations:** Cannot be installed with EIA/CCITT Interface (#3701) or X.21 Adapter for Nonswitched Networks (#5655). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301 or #4501. **Specify:** #9651 for 4-wire strapping, or #9652 for 2-wire strapping.

(Japan only+)

X.21 Adapter For Nonswitched Networks (#5655): This feature provides an interface and 6 meter cable for attachment to an X.21 native nonswitched network with no changes to existing SNA/SDLC procedures for controlling nonswitched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for nonswitched point-to-point and multipoint communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. **Limitations:** Cannot be installed with #5500, #3701, or #5656. Available only on controllers with serial number 9700019 or higher. **Prerequisites:** #6302 or #4502. +)

**3602 Finance Communication Controller (cont'd)**

X.21 Adapter For Switched Networks (#5656): An interface adapter and 6 meter cable for attachment to the X.21 switched network. SDLC communications at speeds of 2400, 4800 and 9600 bps are supported. **Limitations:** Cannot be installed with CCITT Interface (#3701), 1200 bps Integrated Modem (#5500) or X.21 Adapter for Nonswitched Networks (#5655). Available only on controllers with serial number 9700019 or higher. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4502.

SDLC Communications With Business Machine Clocking (#6301): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500) or any 1200 bps external modem which does not have internal clocking, or for local attachment to the 3704, 3705, or 3725 at 1200 or 2400 bps (#4716) or for communications to an 8100 Information System. **Limitations:** Cannot be installed with #6302, #4501 or #4502 (Canada only+ unless #4502 has #9551 for controller attachment). -) **Maximum:** One. **Field Installation:** Yes.

SDLC Communications Without Business Machine Clocking (#6302): Required for attachment to communication lines through an external modem which does have internal clocking at speeds up to 4800 bps or for local attachment to a 4331 a Processor (#4801) at 1200, 2400, 4800 or 9600 bps. **Limitations:** Cannot be installed with #6301, #4501 or #4502 (Canada only+ unless #4502 has #9551 for controller attachment). -) **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3701 or #5655.

1200 bps Loop Integrated Modem (#8001): An integrated modem for transmission to remotely located 3600 Finance Communication System Terminals. Operates at 1200 bps over nonswitched normal quality voice-grade lines. **Note:** Several remote loop configuration variations can be realized; e.g., see the *IBM 3600 FCS Configurator*, GA19-0063. However, facilities are always point-to-point circuits, either 2-wire half-duplex or 4-wire duplex. The common carrier does not tariff 3600 "remote loops". The customer should be referred to the configurator or information in the M2700 pages for definition of the tariffed elements of the remote loop. **Maximum:** One per Add'l Loop (#4735). **Field Installation:** Yes. **Prerequisites:** #4735. Each remote location must have either a 3604 Keyboard Display mdl 2, 3 or 4 equipped with a 1200 bps Loop Integrated Modem (#8001 or #8002), a 3614 or 3624 Consumer Transaction Facility with a 1200 bps Loop Integrated Modem (#8001) or a 3603 as the first attached remote unit in each physical (geographic) location.

MODEL CONVERSIONS

Model 1A can be changed to model 1B. This upgrade requires replacement of the disk storage (not diskette) device. Adequate provision must be made for retaining data contained on disk storage and elimination of user proprietary information. **Limitations:** If model 1A does not have Add'l Disk Heads (#1010) installed, field installation of the Add'l Disk Heads - for model 1B (#1011) concurrently with a model change from model 1A to model 1B requires the submission of an RPQ.

Attachment Factor Functions

Data Sequencing: Allows user applications to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

Set Diskette: Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

Instruction Enhancements: Provides the user application with the following new instructions:

- Bit Manipulation - Test and Branch (LIFON, LIFOFF) - provide a test, set, and branch function in a single instruction. This reduces the 3600 AP processing and memory requirements when processing single bits.
- Logical Compare Data Immediate (CCDI) - compares immediate data to data in a specified field.
- Move Data Immediate (MVDI) - moves immediate data to a specified field.
- Load Data Immediate (LDDI) - loads immediate data into specified register.
- SCALE- formats an input string of characters into a conveniently processable numerical format. When used in processing monetary input, functions such as the removal of the monetary symbol, commas, and periods from the input data are automatically done. In

the event that cents were not in the input data, zero padding is optionally provided. SCALE should significantly reduce the number of instructions required to process monetary input.

- Segment Indexing (SETX, TESTX, SETXREG) - provides an alternate method of referencing data within a segment. Only fixed operands of 3600 instructions may be indexed. This function can be used to reduce the number of SETFPL instructions executed by the AP, thereby enhancing performance and reducing AP size. This function also provides a pseudo DSECT facility, thereby enabling an AP to more readily reference (1) variable displaced data within segments and/or (2) data beyond 4K bytes from the beginning of a segment.
- Branch on Index (BRANX) - provides an index increment, compare and branch function in a single instruction. This instruction is used to control the number of times a series of AP instructions will be executed. Since the instruction algebraically increments a register, BRANX can be used in conjunction with the Segment Indexing facility to simplify the processing of tables.
- Execute (LEXEC) - provides a function similar to the S/370 EXECUTE instruction. The amount of data logically ORed into the target instruction may be 2, 4 or 6 bytes.

Priority Dispatching: Provides the ability to specify the order in which 3601/2 workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP macro.

Translate: The LTRT instruction processes an input data stream against user specifiable translate tables(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).

Extended Statistical Counter Recording: Provides the option to enhance statistical counter recording facilities to assist in fault isolation of degraded loop segments. This facility is particularly useful when a loop consist of multiple remote locations.

Multiple Block I/O - Diskette: Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than three blocks are read or four blocks are written.

3602 Dynamic Sector Relocate: This facility provides a means of recovery when a Write Sector CRC check occurs. This facility, in most cases, replaces the offline manual procedure which requires a special test diskette to reassign failing sectors.

3270/3600 Datastream Mapping: Provides, via four 3600 assembler language instructions, 3600 controller assistance in converting 3270 output display datastreams into an output datastream processable by 3600 attached devices, and 3604 input datastreams into 3270 input datastreams. Additionally, these instructions can aid in converting 3604 output display datastreams into 3270 output display datastreams.

Extended 3270/3604 Keyboard Mapping: Provides simulation of the 3270 Insert, Delete, Erase To End Of Field and Erase Input keyboard functions.

LSECKP Instruction: Locates a table entry which is "equal to" "greater than or equal to" or "less than or equal to" a search argument using a binary search algorithm. Tables may be included in the instruction section of the controller application program, thereby permitting the tables to reside in expanded user programmable storage.

SCRPAD Instruction: Provides access to optional global work areas distinct from segment storage which may reside in base or expanded user programmable storage.

Data Compression/Compaction: This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently occurring characters according to a user defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.

Data Decompression/Decompaction: This function allows a controller application program to decompress and/or decompact a data stream which had previously been compressed and/or compacted by a host or a controller application program.

INTMR Instruction: Permits the collection of elapsed time for events initiated and terminated by controller application program.

(Canada only+)

Extended Diskette Access Method (EDAM) Base: Provides the capability to open, access and close data sets on the primary or

3602 Finance Communication Controller (cont'd)

auxiliary diskette drive.

EDAM Allocate/Deallocate (LDKT Instruction): Provides, via the LDKT Instruction, capability to allocate and deallocate data sets in either the primary or auxiliary diskette drive.

EDAM Temporary File Support: Permits processing of a data set defined with a temporary file structure on the auxiliary diskette drive.

Dynamic Control: Provides additional LCNTRL instruction functions to assist in controlling access to devices attached to the 3602 through the SNA Primary interface.
+)

Extended LLOAD Instruction: Allows a controller application program to load data overlay into segments other than segment 14.

Secondary Logical Unit (LU) Assignment: Allows a controller application program to change the logical unit address associated with a given workstation.

ACCESSORIES

Cables: IBM shielded twisted-pair cable is required for attaching 3600 units. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. For proper identification, installation and application of cable and associated accessories, refer to the *IBM Cabling System - Planning and Installation Guide*, GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation within your country.

Other applicable cable assemblies and associated accessories can be purchased from IBM. See *Physical Planning Manual*, GA27-2766 for cable and connector specifications. Specify bulk number, cable assembly number or part number as appropriate. Allow a lead time of 120 days.

Item No.	Description	Maximum Length
1563155	Loop Cable Assembly	609.6m (2,000')
4474809	Cable Assy (3609-2 to Modem)	2.08m (82 in)
1745372	Cable Assy (Loop Repeater to Loop Terminal Box)	7.62m (25 ft)
1745350	Cable Assy (3603 to Leased Lines)	7.62m (25 ft)
(Canada only+)		
1745349	Cable Assy (DDA to 3603)	7.62m (25 ft)
1741656	Cable Assy (joining 2 telephone lines)	N/A +)
(Canada only+)		
1745348	Cable Assy (3603 to Loop Terminal Box)	7.62m (25 ft) +)
4400029	Cable Assy (PTT leased line to 3603-3)	2.08m (82 in)
1142961	Bulk Cable (12 Conductor)	N/A
5252781	Bulk Cable (4 Conductor)	N/A
5252920	Bulk Cable (2 Conductor)	N/A
765294	Conn. Assy (EIA/CCITT)	N/A
5252769	Bulk Cable (2 Conductor)	N/A
5252913	Bulk Cable (4 Conductor)	N/A
1561344	Strain Relief	
1745363	Conductor Assembly (3603)	
5252763	Male Plug	
5252765	Female Plug	
5420242	Mini-Ty (used with 1745363)	

(Canada and Japan only+)

For attachment of a 3262 or 3287 to a 3694 or a 3602:

2577672	Cable Assy Indoor	1,500m(4,920ft)
or		
323921	Coax Wire	1,500m(4,920ft)
and		
1836418	Connector Kit	N/A +)

Loop Repeater (P/N 4400002): Plugs into the Loop cable and redrives all signals being transmitted in a 3600 Finance Communication System. Each Loop Repeater contains Loop redriving capabilities which allow for the extension of the Loop cable length by 2,000 feet. Loop Repeaters may be employed on a Loop to extend its overall length to a maximum of 20,000 cable-feet. The unit can be physically mounted on a wall in an out-of-the-way location. **Prerequisites:** An operating 3600 System Local Loop or Remote Subloop. **Publications:** GC22-0005.

Customer Responsibilities: The customer may be advised that: (1) The customer is responsible for making certain that the use of the equipment complies with all Country and Local Laws, Regulations, and Ordinances ... (2) The customer is responsible for price quotations, installation and cost (initial and recurring) of common carrier equipment and service ... (3) The customer is responsible for the set-up of the unit ... (4) The customer will determine the failing unit (see "Maintenance" below) ... (5) The customer is responsible for determining the required number of spares.

Physical Planning and Setup: Physical planning and setup is the responsibility of the customer. Attachment to the Loop cable is provided by ordering External Signal Cable Assembly (P/N 174372), or equivalent ... see *IBM 3600 Finance Communication System Installation Manual - Physical Planning*, GA27-2766.

Spares: The customer may wish to replace a failing unit with a spare and must be advised to purchase sufficient spare units for such use. The number of spare units recommended is dependent upon the number of units the customer has installed, application requirements, physical locations and layouts. However, the minimum number of spare units recommended is shown in the following table:

# of Loop Repeaters Installed	Minimum # Spares Recommended
100	2
200	2
300	3
500	4
1000	6
1500	9
2000	10
2500	12
3000	14
3500	16
4000	18
4500	19
5000	21

Warranty: Service is available at the designated IBM Repair Center during the 90 day warranty period, which commences 30 days following date of shipment from the plant of manufacture (Raleigh). It shall be the customer's responsibility to set up the equipment. It shall be the customer's responsibility to determine the failing unit and remove it from the Loop, and if the unit is still under warranty, to pack it in the designated shipping container and ship it prepaid to the designated IBM Repair Center. IBM will return the serviced unit, shipping charges prepaid. There is no regularly scheduled preventive maintenance recommended by IBM on these units. Maintenance agreements are not available. CE on-site service will not be provided.

Ordering: Order P/N 4400002.

Diskettes: The following diskettes may be obtained by contacting IBM.

Diskette 1 (single-sided) 3601/3602	
256 byte format	P/N 2305845
128 byte format	P/N 2305830

Diskette 2 (double-sided) 3601-2B/3B, 3602-1A/2A	
256 byte format	P/N 2736700
128 byte format	P/N 1766870

SUPPLIES (None)

3603 TERMINAL ATTACHMENT UNIT

PURPOSE

Attaches all 3600 System Controllers or 4700 Systems and terminals to the communication facilities. The 3603 enables remote subloop operation by connecting the controller loop feature to the communication facilities which connect to a remote 3603 with the subloop of terminals.

MODELS

(Canada only) **Model 1 001:** Provides 1200 bps integrated circuitry for attachment to communication facilities and has switched network backup capability for use if the nonswitched communication line fails. <)

Model 2 002: Provides a CCITT interface for attachment of a 1200 or 2400 bps PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages. Other external modems may be attached subject to the Multiple Supplier Systems Bulletin.

(Except Canada) **Model 3 003:** Provides a 1200 bps integrated modem. <)

Prerequisites: A 3601 or 3602 with an Add'l Loop Feature (#4735) or a 4701 with or without Add'l Loop (#4745) is required for each remote loop that is attached with a 3603.

The 3603 mdl 2 with clocking (#6352) requires a synchronous modem that accepts Transmit Signal Element Timing from the 3600 system or 4700 system equipment. All new orders should include the clocking feature (#6352) for machines operating at 2400 bps. The 3603 mdl 2 without clocking requires an asynchronous modem. Before ordering the 3603 mdl 2, customer must check with modem manufacturer to determine their mode of operation. As an alternate to a 3603, a 1200 bps Loop Integrated Modem (#8001) in the 3601 or 3602 may be used.

Note: Several remote loop configuration variations can be realized; e.g., see the "IBM 3600 FCS Configurator", GA27-2762. However, regardless of the configuration, the interconnecting common carrier facilities are always point-to-point circuits; either 2-wire half-duplex or 4-wire duplex. The common carrier does not tariff 3600/4700 "remote loops". The customer should be referred to the configurator or information in the M2700 pages for definition of the tariffed elements of the remote loop.

HIGHLIGHTS

- 50 Hz or 60 Hz power connection.
- Can be physically installed on a wall.
- Has self-test facilities to establish valid operation of the 3603 on a remote/local loop exclusive of the nonswitched network.

Customer Responsibilities: The customer must be advised that:

1. He is responsible to make certain that the use of the equipment complies with all national, regional, and local laws, regulations, and ordinances.
2. He is responsible for price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
3. He is responsible for the installation of the unit.
4. The customer will determine the failing unit (see "Central Facility Maintenance" below).

5. He is responsible for ascertaining the number of spares required.
6. The purchaser agrees that IBM is relieved of responsibility from all risks of loss of funds in transactions processed by the 3603.
7. (Except Canada) He is responsible for obtaining and installing the proper power plug on the power cable. <)

The customer is also responsible for the provision of a telephone channel and, with the 3603 mdl 2, an appropriate modem. A cable is available as an MES from IBM for a fee for attaching the 3603 mdl 2 to the modem. Connection of the modem to the communications line and the Controller is a customer responsibility.

The "IBM 3600 Finance Communication System Installation Manual - Physical Planning", GA27-2766, and the "IBM 3600 Finance Communication System Services Terminal - Terminal Installation Guide", GA27-2796, should be ordered for each customer installation.

Publications: GC20-0370

Spares: The customer may wish to replace a failing 3603 with a spare and must be advised to purchase sufficient spare units for such use. The number of spare units recommended is dependent upon the number of units the customer has installed, his application requirements, physical locations, and layouts. However, the minimum number of spare units recommended is shown in the following table:

No. of 3603s Installed	Minimum Number of Spares Recommended
---------------------------	---

(Canada only)

	Mdl 1	Mdl 2
100	2	3
200	3	4
300	4	6
500	6	8
1000	10	14
1500	14	19
2000	17	24
2500	20	28
3000	23	33
3500	27	38
4000	30	42
4500	33	47

Central Facility Maintenance: IBM will accept requests for special contracts for central facility maintenance. Under this offering, service will be performed at a repair facility located on customer

premises. The customer will continue to be required to determine the failing unit and to transport it to and from the facility. Contract requests should be directed to the Manager, Service Business and Contracts.

Central Facility Maintenance - 1 (CFM-1): CFM-1 service will be performed at a customer-owned facility. The customer is responsible for:

- Providing a maintenance facility which includes a 3600 System or 4700 System Controller and 3604 Keyboard Display or 4704 Display Terminal for exclusive customer engineering test use on prime shift at periodic intervals for repair of the 3603.
- Unpacking and installing the 3603 to operate with the 3600/4700 controller and common carrier at the CFM-1 site.
- Determining the failing unit.
- Contacting IBM Customer Engineering to repair the 3603 at the CFM-1 site when a designated number (minimum 2) of units are at the facility for repair. The customer will stock a number of spares equivalent to the sum of the number of designated units plus the appropriate spares recommended.
- Packing and delivering machines which have been serviced to the operational location.
- All shipping and handling charges.

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	
220V #2813	
235V #2814	

Field Installation: Not recommended.

- Machine Nomenclature:

Canadian French #2935	Italian #2932
English #2927	Japanese #2930
French #2928	Spanish #2931
German #2929	

Field Installation: Not recommended.

- Cables: Refer to M3601, 3602 or 4701 "Accessories". Refer also to the "3600 Installation Manual, Physical Planning", GA27-2766.

SPECIAL FEATURES

Clocking (#6352): (Mdl 2) Provides Transmit Signal Element Timing to synchronous modems (1200, 2400 bps). This feature is required for all synchronous modems (including Western 201C and equivalent modems). Field Installation: Not recommended.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Accessories for the 3603 may be purchased from IBM or a customer selected source. Allow a lead time of 120 days.

P/N	Description
78998	Fuse (0.3 Slow Blow - 220/230V 50 Hz)
78999	Fuse (0.5 Slow Blow - 100/110/123.5V)
1745353	Jumper Assembly (Signal Attenuation or Loop Speed)
5929886	Loop Plate (Loop Connector Assy)

SUPPLIES (NONE)

3624 CONSUMER TRANSACTION FACILITY

PURPOSE

An unattended self-service banking terminal that issues variable amounts of money, accepts deposits, and performs other financial transactions. Other documents, such as travelers checks, may be dispensed if they complete a document issue qualification test successfully. Attaches to a 3601 or 3602 or 4701 Finance Communication Controller or a 4702 Branch Automation Processor via loop or to a virtual storage S/370 or 4300 Processor via SDLC through a 3704, 3705 or 3725 Communications Controller. Communication is also possible via a Communications Adapter feature on a 4321 or 4331 Processor. A virtual storage S/370 attachment is also available via BSC through a 3704, 3705 or 3725.

MODELS

Model 1 001: Lobby - Single Document Feed Mechanism. For use inside a building in a secure attended location. The basic model includes a single cartridge feed station, card reader, user guidance keyboard and display unit and is suitable for counter-top or free-standing mounting. Also includes covers and front trim paneling. The covers contain locking handle, with a standard key, and provision for customer insertion of an additional keylock cylinder. A backlit logo panel, required for installation of lobby mdl, is available as a purchase accessory. A pedestal is available as a purchase accessory to mount the basic lobby model. A pedestal base is included as part of the depository special feature when the depository is added to the basic mdl.

Model 2 002: Through the Wall - Single Document Feed Mechanism. For outdoor, vestibule, drive-up, and otherwise less secure, unattended locations to provide availability on a 24-hour basis. The basic mdl includes a single cartridge feed station, card reader, user guidance keyboard, and display unit and has provision for mounting the currency dispensing and depository mechanisms inside a heavy-duty security enclosure. Covers are provided for the components not contained within the heavy-duty enclosure. A heavy-duty enclosure, pedestal base for mounting the enclosure, through-the-wall bezel, front trim paneling, and logo panel, for through-the-wall installation are available as purchase accessories.

Model 11 011: Same as model 1 but with dual document feed mechanism. Provides capability to issue the same or two different denominations in a single transaction; to load the same denomination in both dispensers, effectively doubling the bill capacity of a single denomination model 1 3624; or to issue currency and other documents as separate transactions (e.g., cash and travelers checks).

Model 12 012: Same as model 2 but with dual document feed mechanism. Provides capability to issue the same or two different denominations in a single transaction; to load the same denomination in both dispensers, effectively doubling the bill capacity of a single denomination model 2 3624; or to issue currency and other documents as separate transactions (e.g., cash and travelers checks).

Prerequisites: Each 3624 must be either loop-attached to a 3600/4700 or direct-attached to a S/370 or 4300 processor.

For Loop Attachment to a 3600/4700 -- there must be an available position on a local or remote loop of a Controller. The 3624 must have Terminal Loop Feature (#7820). See description of #7820.

For Direct Attachment to a S/370 or 4300 Processor -- S/370 or 4300 Processor requires a virtual storage processor and a 3704, 3705 or 3725 Communications Controller or the Communications Adapter feature on the 4331 that is equipped with appropriate features to communicate with a 3624 via SDLC. (See M3704, 3705, 3725 or 4331 pages.) The 3624 must have SDLC Communications feature (#6301 or #6302) for S/370 or 4300 Processor attachment or BSC Communications feature (#1421 or #1422) for S/370 attachment.

Encryption modules BQKDES is required with 3600 or 4700 Host Support Independent Release program. See your Area Program Release Support Center for the feature numbers used to order these modules on the 3600 or 4700 Host Support IR. Source listings are not orderable for, nor supplied with, these modules. Customers should be informed of this fact before the 3624 is ordered.

Depending on the configuration, Add'l Storage Feature (#1005, #1006 or #1007) may be required on the 3601; or Add'l Storage Feature (#1006 or #1007) may be required on the 3602 or Add'l Storage (#1008) may be required on the 4701. See M3601 or 4700 pages.

For 3624 mdls 2 and 12:

The following units are required for through-the-wall installation:

1. Heavy-Duty Enclosure, Single Function (#3901) or Dual Function (#3902).
2. Bezel, Through-the-Wall, recessed or non-recessed. Recessed Bezel (#1490) is recommended for walk-up configuration. Non-recessed Bezel (#1491) is recommended for drive-up configuration.
3. Front Dress Panel (#3951). Front Trim Border, With Envelope Holder (#3961) or Without Envelope Holder (#3962).
4. Pedestal for single function heavy-duty enclosure (#4901) or dual function heavy-duty enclosure (#4902) is optional for mounting heavy-duty enclosure at appropriate height for walk-up or drive-up use. Storage Cabinet (#4903) is optional when mounting dual function heavy-duty enclosure without pedestal.

Note: Storage cabinet is included with Pedestals (#4901 and #4902). (See "Accessories" for descriptions and ordering information.) Purchase only.

Logo Panel -- Required on all 3624 mdls.

Currency Cartridge -- For 3624 mdls 1 and 2: One is required. For 3624 mdls 11 and 12: Two are required. Currency cartridges are not included with basic 3624 and must be ordered separately.

HIGHLIGHTS

Cartridge Loading -- currency cartridge provides for quick, easy loading and convenient, tamper-resistant transportation of the currency.

Issues Cash -- issues one (mdls 1 and 2) or two (mdls 11 and 12) denominations up to a maximum of 20 bills from a choice of accounts. Issues all bills at one time in a single stack; no pre-packaging or packets are used.

Individual Document-Feed Control -- allows each cartridge drive station on dual-feed mdls 11 and 12 to be associated with separate transactions (e.g., cash or travelers checks).

Accepts Deposits -- allows user to make a deposit to choice of accounts. Built-in depository envelope holder available as an accessory on mdls 2 and 12. Envelope holder included with depository on mdls 1 and 11.

Cash-Check -- a single transaction that allows cash to be issued to user, following deposit of a check.

Accepts Payments -- allows user to make various payments by depositing cash or check or by having funds deducted from user's account. Depository Cartridge Locking System -- depository cartridge and locking mechanism prevents removal of cartridge from machine unless cartridge is closed and locked; reduces need for dual-custody depository servicing.

Depository Envelope Printer -- prints unit and sequence number on envelope as it is deposited.

Additional Transactions -- provides account balance inquiry, funds transfer transaction, and special transactions.

Keyboard/Guidance -- comprehensive set of function keys and customized display messages step a user through a transaction. Keyboard and transaction functions can be modified through programming. Option for either numeric or alphanumeric keypad.

Multiline Display -- special feature provides 240-character, 6-line display. Includes additional display-related user response capability for expanded interaction between user and machine.

Transaction Chaining -- allows user to perform a series of transactions with a single insertion of a magnetic stripe card.

Transaction Statements -- can print and issue individual statements or messages to user.

Journaling -- can print and retain documents within the 3624.

Backlighting Logo -- backlighting logo panel that can be customized, extending across full width of the front panel.

Host/Subhost Attachment -- allows attachment to host CPU either directly via SDLC /BSC or through subhost 3600 or 4700 Controller via loop communications. Offhost operation at 3600 or 4700 is possible.

Encrypt/Decrypt -- encryption of sensitive data for communication line transmission. Uses the U.S. Federal Information Processing Data Encryption Standard (DES) algorithm.

Multi-institution Usage -- provision to accept magnetic stripe cards of many different card issuers. Base capacity of issuer identifier table within 3624 can be expanded by table overflow request message to host or with Add'l Storage special feature in 3624.

Personal Identification -- user account is identified through reading magnetic stripe card. To validate the identity of the person using the card, a personal identification number (PIN) is used. Validation of PIN (up to 16 digits) may be performed in the 3624 and/or host/subhost support system. Installation Configurations -- can be installed inside a building, for lobby use; or through-the-wall of a building, for walk-up or drive-up use.

Multiple Languages -- capability to display different languages based on identifier code recorded on magnetic stripe card.

Third Track -- special feature provides reading and writing third track data recorded on magnetic stripe card.

Add'l Storage -- special feature provides additional memory for expanding the number of custom messages and Financial Institution Table entries.

Modular Packaging -- for mdl 2 or 12 through-the-wall installation; currency dispenser and depository mechanisms are housed in a heavy-duty enclosure independent of other functional modules.

Compatibility -- 3614 family compatibility, designed to minimize transition requirements.

Security -- Mdl 2 and 12 installed with heavy-duty enclosure and through-the-wall installation accessories meet security requirements of UL291.

Walk-up Configuration: Recessed through-the-wall bezel, designed to provide a shelf surface for the user, is recommended for walk-up use.

Drive-up Configuration: Non-recessed through-the-wall bezel, designed to position the user area nearer the outer wall surface, is recommended for drive-up use.

Customer Responsibilities, Installation Facilities -- Because the 3624 mdl 2 or 12 attaches to customer premises, installation of cables, pedestal, heavy-duty enclosure, through-the-wall bezel, front dress panel, front trim border, and logo panel are customer responsibilities; the customer is also responsible for site preparation, such as cutting a hole in the wall. (APG only) For mdls 2 and 12,

with Specify Feature #0291 the customer is responsible for placement of the document feed and depository modules into the heavy-duty enclosure and attachment of the I/O module to the heavy-duty enclosure. Installation of cables and site preparation are customer responsibilities also, for 3624 lobby mdls 1 and 11.

Keylocks -- Covers included with lobby mdls 1 and 11 have a locking handle, with a standard key, and provide for customer insertion of an additional keylock cylinder. Covers included with through-the-wall mdls 2 and 12 have a keylock cylinder, with a standard key. Cabinet doors, included in all pedestals, have a keylock cylinder, with a standard key. The Dial Keylock available for the combination lock on the heavy-duty enclosure includes standard key. Currency cartridges provide for customer insertion of a keylock. Depository cartridge used with depository cartridge locking feature requires customer insertion of the depository keylock. Depository locking mechanism in 3624 requires customer installation of the depository cartridge locking key. If the customer desires to change the locks and/or keys included with these units or to install additional keylock cylinders where provided for, he is responsible for their procurement and installation.

Machine Maintenance -- IBM will not provide warranty or maintenance service on a 3624 containing money. The customer will be responsible for removing, controlling, and reloading all money in the 3624 so that IBM can fulfill its warranty and maintenance obligations.

Accessories Maintenance -- The customer is responsible for maintenance and parts procurement on all accessories.

If requested by the customer, CE will provide on-site service (on a per call billable basis) for the door mechanism (excluding lock) in the heavy-duty Enclosure. The CE can also perform (on a per call billable basis) the replacement of the following accessories: Front dress panel, bezel and trim border, logo lamps, logo lamp ballast assembly, currency area lockoff panel, currency area lockout panel lock assembly, storage cabinet, storage cabinet lock assembly, storage cabinet door hinges, logo panel, envelope holder lock and heavy-duty enclosure combination lock (lock replacement available only where licensing and bonding requirements permit). IBM services for repair or replacement of the above accessories will be on a per call billable basis. During the warranty period, parts for all accessories will be provided (when required), by IBM at no cost to the customer. For the post-warranty period, all accessory parts can be purchased by the customer through IBM. Currency and depository cartridge servicing can also be provided by CE on a per call billable basis.

Notes

1. Customer must arrange for DFM removal prior to CE replacement of DFM Slides.
2. Replacement of the heavy-duty enclosure door or door hinges remains a customer responsibility.

An optional maintenance service is available on IBM Currency Cartridges which are used on the 3624 Consumer Transaction Facility. This IBM service offering provides for CEs to deliver IBM On-Site Repair service for Currency Cartridges which are used in conjunction with a 3624 which is 1) under warranty, 2) under IBM Maintenance Agreement, or 3) under the Agreement for Lease or Rental of IBM Machines.

IBM provides this additional service for IBM Currency Cartridges under an amendment entitled Amendment to the IBM Maintenance Agreement for Currency Cartridges Used with a 3624. An incremental charge for each IBM Currency Cartridge covered under the Amendment will be invoiced to Customers who elect to have this service. This charge will be billed by applying a four digit code, similar to a feature code, to one or more of the installed 3624 machines and will be included on the customers monthly maintenance invoice. The code for Currency Cartridge Maintenance Service is #5550.

Currency Cartridge -- The 3624 Currency Cartridge is a purchase-only accessory and not included with the basic 3624. One cartridge for mdls 1 and 2 and two cartridges for mdls 11 and 12 are necessary for installation check-out and operation of 3624. Mdl 11 and 12 may also be operated with a single cartridge only. Car-

tridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machine. The customer is responsible for determining if the cartridge is the failing unit; for providing cartridge for CE 3624 maintenance and testing, and for providing 3624 for testing of cartridges after cartridges have been repaired on-site at locations where on-site repair service is available (a minimum of one spare cartridge for mdls 1 and 2 and two spare cartridges for mdls 11 and 12 must be made available by customer to the CE for normal 3624 maintenance) and for setting the keying system on the cartridges and drive stations so that there is the desired match of currency denomination to drive station. See Customer Responsibilities in "Accessories" for installation and maintenance requirements.

Currency Sorting -- To achieve satisfactory operation, the customer must ensure that only new currency and good-quality used currency are used in the 3624. The general condition of used currency may vary. Used currency must be inspected to remove excessively worn, damaged, or torn bills. The "IBM 3624 Operator's Guide", GA66-0006, and "IBM 3624 Cartridge Owner's Manual", GA66-0005, contain procedures for preparation of new currency and inspection of used currency for operation in the 3624. For the 3624 mdls 11 and 12, the customer must ensure that each feed mechanism is loaded with the proper denomination currency. The cartridges contain a keying mechanism which can be set by the customer to ensure a match between specific cartridges and cartridge drive stations.

Printer Ink Rolls -- The customer is responsible for procurement and replacement of ink rolls in transaction statement and depository printers.

Logo Lamp -- The customer is responsible for procurement and replacement of the lamp in the logo panel light assembly.

Damage -- IBM is not responsible for misuse, vandalism, burglary, and damage to the 3624 and any 3624 accessories caused by firearms or explosives or other intentional damage. Repair of such damage is not covered under the IBM Lease/Rental Agreement, Maintenance Contract or Pilot Test Plan. Repair of such damage at cost of time and materials will be made to rental and pilot test machines and can be provided for purchase machines. For necessary contractual modifications, refer to ZM78-0016.

System Integrity -- Subhost operation, under control of the 3600 or 4700 Finance Communication Controller, requires customer systems design and support. Maintenance of system integrity in the subhost is a customer responsibility.

IBM is not responsible for any loss of money to the financial institution or its customers through the use of the 3624.

Third Track System Security Statement -- Customers ordering Third Track feature (#7950) must be advised that:

"IBM believes that the system security is optimized in an online environment, where PIN validation and transaction authorization can be performed in conjunction with positive-file data bases. The scope of security exposure expands with the degree of offline implementation, for which the Third Track might be used. The U.S. Federal Information Processing Data Encryption Standard (DES) algorithm is utilized to provide cryptographic security in the 3624 and may be used in conjunction with the third track application. IBM recommends that the customer consider using DES for this purpose. An optional security feature of the proposed ISO Third Track Data Content standard is a Crypto Check Digits (CCD) field in the card, which may be used to relate the data elements of track 3 to the magnetic stripe. This does not imply, however, that its use is not subject to fraud techniques. ISO has not prescribed using the optional CCD field or any specific CCD implementation technique. IBM recommends that the customer consider its value in his application, weighing possible enhancements in security with economic and

performance implications for his system. IBM will continue to pursue a course of action with customers and industry to maintain a high level of system security.

IBM reserves the right to modify the parameters of the Third Track functions if the parameters of the final ISO standard differ from those now in the process of standardization. However, this reservation of rights is not intended nor should it be construed as a commitment by IBM to support parameters different from those published by ISO/DIS 4909-June 1976."

Publications: GC20-0370

SPECIFY

- (Canada only > Voltage (AC, 1-phase, 60 Hz): #9911 for 120V (usable on 115V). <)
- (Except Canada > Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
127V #2820	120V #9911
220V #2813	127V #2823
240V #2801	

Note: 120V AC is compatible with existing 115V systems. <)

- Cabling: Refer to "Installation Manual-Physical Planning", GA27-2766 and GA26-1658. Also see M3601 and 3602 pages.
- Machine Nomenclature: Specify one of the following:

Canadian English #2934	Japanese #2930
Canadian French #2935	Spanish #2931
English US #2924	

- Currency Denomination: Each currency denomination to be specified consists of a set of two codes: The first, to identify the country; and the second, to identify the denomination and issue series. Specify both of these codes for each denomination.

Mdls 1 and 2: Specify one Country-Denomination set only.

Mdls 11 and 12: Specify two different Country-Denomination sets or the same set twice.

Note: If 3624 mdl 11 or 12 is being used with the change-making capability, specify two different Country-Denomination sets; if 3624 mdl 11 or 12 is being used with single denomination, specify the same Country-Denomination set twice.

(Canada only > The 3624 is available in countries with currencies acceptable to the 3624. Orders will be accepted only for currencies which have successfully completed an issue test (see list of currencies). The currency issue tests may indicate that changes in the currency dispenser mechanism are required (because of size, opacity, and other unique characteristics of various currencies). An RPQ may have to be submitted and priced for these dispenser changes. To arrange for a currency test, submit an RPQ to SCD Special Engineering, Boeblingen, Germany. Specify currency denomination and issue to be tested. Specify both of the codes shown for each currency below, except U.S. (Specify #9091 only for U.S.): <)

Specify Both Numbers			

Country	Denom- ination	Currency	Series Issue
-----	-----	-----	-----

#2778	#2702	Canada	10 dollar	Bank of Canada, 1971
#2778	#2703		20 dollar	Bank of Canada, 1969
#9091		USA	5,10,20 dollar	Federal Reserve Note
#2782	#2701	Venezuela	50 bolivare	Banco Central de Venezuela,
#2782	#2702		100 bolivare	Current Series

- Keyboard Overlay Arrangement: (For machines with US nomenclature (#2924) only) Specify #9301 for numeric-only overlay. Specify #9302 or #9303 for alphameric overlay. #9302 is the basic touch-pad telephone format with the Q and Z added over the numeric "0" and no alpha over the number "1". #9303 is the American Banking Association Standard for-

mat with the Q and Z over the numeric "1" and no alpha over the numeric "0". All are field installable.

Sample exhibit below illustrates #2924 with #9301. An RPQ should be submitted for a specialized keyboard overlay.

1	2	3	4	5	6	7	8
Withdraw Cash	Deposit	From Checking	To Checking	1	2	3	Cancel
Fixed Amount	Cash Check	From Savings	To Savings	4	5	6	
Account Balance	Payment	From Credit Card	To Credit Card	7	8	9	Change
Transfer	Other Service	From Other Account	To Other Account	Corr- ection	0 Decimal Point		OK

Note: Japan Triple Zero Key: When Japan Nomenclature is specified, the keyboard overlays will have a triple-zero (000) key in place of the comma (decimal position) key.

Keyboard Mask: Specify one of the following for standard keyboard mask arrangement; an RPQ should be submitted for

any keyboard mask not shown below. All are field installable. The Change key allows the user to request a change in the denomination mix to be issued on mdls 11 and 12. The change key is used also, on all mdls, to page displays with the Multi-line Display feature (#4750).

Specify	Number	Transaction Type										From Acct to Acct		
Without Change Key (all mdls)	With Change Key (mdls 11/12) or All Mdls with #4750	W i t h d r a l	S e c i a (3)	B a n c r (1)	T e l e c o n f e r (2)	D e p o s i t (2)	P a y m e n t	E m l (2)	P m t F r o m A c c t (2)	C h e c k (2)	C h e c k i n g	C r e d i t C a r d		Other

#9355	#9455	0	0	0							0	0		0
#9356	#9456	0	0	0							0	0		0
#9357	#9457	0	0	0	0	0	0	0			0	0		0
#9358	#9458	0	0	0		0					0	0		0
#9359	#9459	0	0	0	0						0	0		0
#9360	#9460	0	0	0		0					(1)			
#9361	#9461	0	0	0							(1)			
#9362	#9462	0	0	0	0	0	0	0		0	0	0	0	0
#9363	#9463	0	0	0		0				0	0	0		0
#9364	#9464	0	0	0		0				0	(1)			

Notes:

- Key position does not appear on the keyboard panel; single function is selected automatically.

2. Prerequisites: Depository #3233, #3234, #3243 or #3244.
 3. Prerequisites: Depository #3233, #3234, #3243 or #3244 if any Special transactions are customized to require a deposit step.
 4. Two different currency denominations should be specified if Change Key specified on mdl 11 or 12.
- Controller-Data Designation: 1st and 2nd position designation is required to control distribution and maintenance of controller-data media necessary for 3624 load images. Specify either #9491 or #9492 as follows:

1st Position Designator (#9491). Used to determine controller-data set to be distributed to host-system location. One 3624 attached to a host-system processor is specified #9491.

2nd Position Designator (#9492). Used to identify additional 3624s attached to host-system. Controller-data set media are not distributed to host-system location for any 2nd position designated 3624s.

When 1st position #9491 is specified, also specify one of the following:

If magnetic tape is used at the host system location:

#9412 9-track 800 bpi
#9413 9-track 1600 bpi
#9414 9-track 6250 bpi

If magnetic tape is not used at the host system location (DOS/VS users only):

#9431 80-column cards
#9432 96-column cards

When 1st position #9491 is specified, additional information is required to determine the shipping address of the controller-data media. Supplemental Specifications are to be entered exactly as follows to indicate the shipping address of the host system location:

Line 1—IBM Programming Support Representative (PSR)
Line 2—C/O (Name of Customer)
Line 3—Street Address (or PO Box Number)
Line 4 (etc.)—City, Country (Province), Postal Code

This is the address to which controller-data media will be automatically shipped after the first 3624 is ordered.

Changes to 1st Position Designators for On-order and Installed 3624s: If a 1st position #9491 3624 is deferred, cancelled, or discontinued and 2nd position #9492 3624s have been specified, then one 2nd position 3624 must be altered from 2nd to 1st position (from #9492 to #9491) to ensure continued distribution of controller-data media to host system location. When altering a 3624 to 1st position, include all items as required to be specified when #9491 is specified (items specified on previous 1st position 3624). If the host system location changes the input medium (e.g., from 1600 bpi to 6250 bpi tape), the media specify code must be changed on the 3624 with #9491 specified. In this case, the former media specify code must be deleted and the new one added by MES.

SPECIAL FEATURES

Add'l Storage (#1301): Provides an additional 2,048 bytes of storage. The user can utilize this to increase the number of custom messages, entries in Financial Institution Table, and as might be necessary for RPOs. To determine the number of additional storage features required, see GC66-0009, "IBM 3624 Programmer's Reference Manual and Component Description". Maximum: Two if without Multiline Display (#4750). Five if with Multiline Display (#4750). Field Installation: Yes. Prerequisites: Storage Expansion Feature (#6501) is required for either: (1) First Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and SDLC Communications Feature (#6301 or #6302), (2) Or third Add'l Storage Feature (#1301) increment when ordered with Multiline Display

(#4750) and Terminal Loop Feature (#7820), (3) Or first Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and BSC Communications feature (#1421 or #1422).

BSC Communications With Clocking (#1421): Provides capability to attach to a host system (e.g., S/370) via BSC. Required for attachment to communications facilities through the IBM 1200 bps Integrated Modem (#5500), or through the EIA Interface (#3701) to any 1200 bps external modem which does not have internal clocking. Limitations: Cannot be installed with Terminal Loop (#7820), SDLC Communications feature (#6301 or #6302), BSC Communications Without Clocking (#1422), or 1200 bps Loop Integrated Modem (#8001). Maximum: One. Field Installation: Not recommended if Terminal Loop (#7820) or SDLC Communications feature (#6301 or #6302) is installed. Can be changed from BSC Communications Without Clocking (#1422) to BSC Communications With Clocking (#1421). Prerequisites: IBM 1200 bps Integrated Modem (#5500) if no external modem, or EIA Interface (#3701) if external modem. Transmission: This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages. External Modem: 3976-3 Modem operating at 1200 bps may be attached.

BSC Communications Without Clocking (#1422): Provides capability to attach to a host system (e.g., S/370) via BSC through 3704, 3705 or 3725. Required for attachment to communications facilities through the EIA Interface (#3701) to any external modem which provides internal clocking speeds up to 4800 bps. Limitations: Cannot be installed with Terminal Loop (#7820), SDLC Communications feature (#6301 or #6302), BSC Communications With Clocking (#1421), IBM 1200 bps Integrated Modem (#5500), or 1200 bps Loop Integrated Modem (#8001). Maximum: One. Field Installation: Not recommended if Terminal Loop (#7820) or SDLC Communications feature (#6301 or #6302) is installed. Can be changed from BSC Communications With Clocking (#1421) to BSC Communications Without Clocking (#1422). Prerequisites: #3701. Transmission: This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages. External Modems: IBM external modems that may be attached are:

3863 mdl 12 400/1200 bps nonswitched
3868 mdl 12 400/1200 bps nonswitched
3864 mdl 14 800/2400 bps nonswitched
3868 mdl 24 800/2400 bps nonswitched
3872 mdl 12 400/1200 bps nonswitched

Depository Cartridge Locking (#3150): (Mdl 2, 12) Provides locking mechanism in the depository that prevents removal of the depository cartridge unless it is closed and locked. Operates with Depository Cartridge (#3155). See "Accessories" for purchase of cartridges. Maximum: One. Field Installation: Yes. Prerequisites: #3243. Minimum of one #3155 is required for operation.

Depository, Lobby (#3233): (Mdl 1, 11) Provides envelope transport mechanism leading from a controlled access slot to deposit receptacle inside the 3624. The depository transport is designed to discourage tampering with previously inserted deposits. Includes a pedestal stand, with lockable rear access door and standard key, and a built-in depository envelope holder. Deposit envelopes may vary in size from 88.9mm x 152.4mm (3.5 x 6.0 in.) to 114.3mm x 247.7mm (4.5 x 9.75 in.) and shall be constructed of paper having basis weight of sub 20 through sub 28. Maximum thickness of a deposit envelope and its contents is 12.7mm (0.5 in.). Limitations: Cannot be installed in Pedestal, Lobby (#5510). Maximum: One. Field Installation: Yes.

Depository, Through-The-Wall (#3243): (Mdl 2, 12) Provides envelope transport mechanism leading from a controlled access slot in the security enclosure to deposit receptacle inside the 3624. In addition to the controlled access slot in the security enclosure, the depository transport is designed to discourage tampering with previously inserted deposits. Deposit envelopes may vary in size from 88.9mm x 152.4mm (3.5 x 6.0 in.) to 114.3mm x 247.7mm (4.5 x 9.75 in.) and shall be constructed of paper having basis weight of sub 20 through sub 28. Maximum thickness of a deposit envelope and its contents is 12.7mm (0.5 in.). Limitations: Cannot be installed with Heavy-Duty Enclosure, Single Function. Maximum: One. Field Installation: Yes. Note: Field installation requires Heavy-Duty En-

closure, Dual Function to have been initially ordered. Prerequisites: Heavy-Duty Enclosure, Dual Function (#3902).

Depository Printer (#3245): Prints sequence number on envelope as it passes through the depository throat. Six numeric digits are printed horizontally at repeated intervals along the envelope. Three digits are set by CE to identify unit, and three digits are automatically sequenced when envelope passes print station. The depository ink roll is P/N 457149. It is customer's responsibility to purchase and replace the ink roll when required. Maximum: One. Field Installation: Yes. Prerequisites: #3233 or #3243.

EIA Interface (#3701): (Canada only) Provides the appropriate internal cables and interface logic necessary to attach an external modem for communications attachment to the processor via BSC through the 3704, 3705 or 3725 SDLC through the 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. Note: Connecting cables must be ordered separately. Limitations: Cannot be installed with 1200 bps Integrated Modem (#5500) or Terminal Loop Feature (#7820). Maximum: One. Field Installation: Yes. Prerequisites: #6301 or #6302 or BSC Communications Feature (#1421 or #1422). Specify: If operation will be with an NTT modem in Japan, specify #2946.

Multi-line Display (#4750): Displays up to 240 characters (six lines of 40 characters each). Characters are presented in predefined 7x9 and 7x7 dot matrices for uppercase alphabetic, special characters, and language-unique characters, including the Hebrew alphabet. Additional interactive functions are provided for expanded communications between the user and the attached host. Maximum: One. Field Installation: Yes. Prerequisites: (1) The change key is required if display paging. See "Keyboard Specify". (2) Increased storage may be required to support larger size of display and additional interaction function. See Add'l Storage Feature (#1301) and Storage Expansion Feature (#6501).

IBM 1200 bps Integrated Modem (#5500): Provides an internal modem for communications attachment to the processor via SDLC /BSC at 1200 bps over nonswitched half-duplex or duplex voice-grade lines. Limitations: Cannot be installed with Interface (#3701), SDLC Communications Feature Without Clocking (#6302), BSC Communications Without Clock (#1422), Terminal Loop Feature (#7820), or 1200 bps Loop Integrated Modem (#8001). Maximum: One. Field Installation: Yes. Prerequisites: #6301, #1421. Specify: #9651 for 4-wire strapping or #9652 for 2-wire strapping. (Japan only) Specify #2943 for NTT D-1 Service Connection. <

SDLC Communications With Clocking (#6301): Provides capability to attach to a host system via SDLC, e.g., S/370 or 4300 processor through 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Required for attachment to communications facilities through the IBM 1200 bps Integrated Modem (#5500), or through the Interface (#3701) to any 1200 bps external modem which does not have internal clocking. Limitations: Cannot be installed with Terminal Loop Feature (#7820), SDLC Communications Without Clocking (#6302) or 1200 bps Loop Integrated Modem (#8001) or BSC Communications Feature (#1421 or #1422). Maximum: One. Field Installation: Not recommended for field installation if Terminal Loop Feature (#7820) or BSC Communications Feature (#1421 or #1422) is installed. Can be changed from SDLC Communications without Clocking (#6302) to SDLC Communications With Clocking (#6301). Prerequisites: #5500 if no external modem, or #3701 if external modem. Transmission: This feature operates over (Canada only) common carrier < (Except Canada > PTT <) communication facilities. For information concerning these facilities, see M2700 pages. External Modem: 3976 Modem mdl 3 operating at 1200 bps may be attached.

SDLC Communications Without Clocking (#6302): Provides capability to attach to a host system via SDLC, e.g., S/370 or 4300 Processor through 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Required for attachment to communications facilities through the Interface (#3701) to any external modem which provides internal clocking speeds up to 4800 bps. Limitations: Cannot be installed with Terminal Loop Feature (#7820), SDLC Communications with Clocking (#6301), IBM 1200 bps Integrated Modem (#5500) or 1200 bps Loop Integrated Modem (#8001) or BSC

Communication Adapter (#1421 or #1422). Maximum: One. Field Installation: Not recommended if Terminal Loop Feature (#7820) or BSC Communications Feature (#1421 or #1422) is installed. Can be changed from SDLC Communications With Clocking (#6301) to SDLC Communications Without Clocking (#6302). Prerequisites: #3701. Transmission: This feature operates over (Canada only) common carrier < (Except Canada > PTT <) communication facilities. For information concerning these facilities, see M2700 pages.

External Modems: IBM external modems that may be attached are:

Modems	Speed (bps)	Lines
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-12	2400/1200	Nonsw or Sw voice grade
3864-1,2	4800/2400	Nonsw or Sw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3872-1	2400/1200	Nonsw or Sw voice grade
5811-10	2400/4800/ 9600	Limited distance modem
5811-18		Rack mount version of mdl 10
5811-20	2400/4800/ 7200/9600	Nonsw baseband
5811-28		Rack mount version of mdl 20

Note: 4-wire Switched Network Backup is available on 3863 and 3864. For communications capability, product utilization, and features, see M2700, 3863 and 3864 pages.

Storage Expansion (#6501): Provides capability to add increments of Add'l Storage Feature (#1301) if Multiline Display (#4750) is installed. Required for either: The first Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and SDLC Communications Feature (#6301 or #6302), or Multiline Display (#4750) and BSC Communication Storage Feature (#1421 or #1422), or #1301 increment when ordered with Multiline Display (#4750) and Terminal Loop Feature (#7820). Maximum: One. Field Installation: Yes. Prerequisites: #4750.

Terminal Loop (#7820): Provides capability to attach to a 3600 or 4700 controller directly on a local or remote loop, or to a 3600 or 4700 controller indirectly through a 3603, 3604, 3614, or another 3624 on a remote sub-loop. Limitations: (1) Cannot be installed with SDLC Communications (#6301 or #6302) or BSC Communications Feature (#1421 or #1422) or Interface (#3701) or IBM 1200 bps Integrated Modem (#5500). See table below. Maximum: One. Field Installation: Not recommended if SDLC Communications (#6301 or #6302) or BSC Communications Feature (#1421 or #1422) is installed. Prerequisites: Available position on the loop. Also, see table below. Specify: See table below.

COMMUNICATE TO OR THROUGH	ATTACH- MENT	LOOP	NOTES
3601	Direct	Local Loop	1,2,3
3602	Direct	Local Loop	1,2,3
4701	Direct	Local Loop	1,2,3
4702	Direct	Local Loop	2,3
3601	Direct	Remote Loop	1,4,6
3602	Direct	Remote Loop	1,4,6
4701	Direct	Remote Loop	1,4,7
4702	Direct	Remote Loop	2,3,7
(Canada only)			
3603-1	Remote	Remote Subloop	1<
3603-2	Remote	Remote Subloop	1,2
(Except Canada)			

3603-3	Remote	Remote	Subloop	1<)
3604-2	Remote	Remote	Subloop	1,5,8
3604-3	Remote	Remote	Subloop	1,5,8
3604-4	Remote	Remote	Subloop	1,5,8
3614	Remote	Remote	Subloop	1,9
3624	Remote	Remote	Subloop	1,10

Notes:

1. Specify #9062 for 1200 bps.
2. Specify #9063 for 2400 bps.
3. Specify #9064 for 4800 bps.
4. Requires #8001 (1200 bps Loop Integrated Modem).
5. Not recommended if 3624 is intended to operated while 3604 is not, e.g., evenings, weekends
6. Additional Storage (#1005, #1006, or #1007) may be required on 3600 Controller. See M3600 pages.
7. Additional Storage may be required on 4700 Controller. See M4700 pages.
8. Requires Line Feature Base (#4751 or #4752) and appropriate modem on 3604.
9. Requires Terminal Loop Feature (#7820) and 1200 bps Loop Integrated Modem (#8001) on 3614).
10. Requires Terminal Loop Feature (#7820) and 1200 bps Loop Integrated Modem (#8001) on 3624.

Third Track (#7950): Provides for reading data on track 2 and/or both reading and writing data on track 3 of magnetic stripe card. Presently conforms to ISO/3554/AD1 Third Track Standard, and proposed Data Content Standard ISC/DIS 4909. Can read tracks 2 and 3 independently or in conjunction with each other. Maximum: One. Field Installation: Not recommended.

1200 bps Loop Integrated Modem (#8001): Provides an internal modem for attachment to 3601/3602 remote loop. Operates at 1200 bps over nonswitched unconditioned voice-grade lines. Limitations: Not required if 3624 is attached to a 3600 or 4700 remote loop through a 3603, 3604 mdl 2, 3 or 4, 3614 or another 3624, or if attached to a 3600 or 4700 local loop. If there are both a 3604 and a 3624 located at the same remote loop location that does not have a 3603 or 3614, it is recommended that the loop modem (#8001) be located on the 3624 because the 3624 might often be operating while the 3604 is not, e.g., weekends. Maximum: One. Field Installation: Yes. Prerequisites: #7820. (Japan only) Specify: #2943 for NTT D-1 Service Connection. <)

Transaction Statement Printer (#8201): Prints document showing record of transaction and issues to user through the transaction statement slot; prints documents for audit use that can be retained in a journal stacker in the 3624. Print feed hopper has capacity of 2,000 documents. Journal stacker has capacity of 400 documents. Data is printed on 96-column card stock 66.7mm x 82.6mm (2-5/8 x 3-1/4 in.). Provides a 57-character set consisting of 56 printable graphics and space (blank). Four lines can be printed with up to 34 characters per line (maximum of 136 characters on each document). The data to be printed is determined by the host application program. Printing is overlapped with currency issue and user deposit cycles. Card Limitations: The 96-column card stock used in the statement printer must not have corner cuts. Detailed disclosure specifications describing 96-column card stock are available from IBM Corporation, Commercial Development Office, Armonk, N.Y. Maximum: One. Field Installation: Yes. Specify: Print Element Character Set Group:

Japan English #2955 US #2956
Japan Katakana #2973
Spanish Speaking #2969

MODEL CONVERSIONS (NONE)

ACCESSORIES

Installation Accessories: (Mdl 2, 12) (Purchase only) Provide heavy-duty steel enclosure. Through-the-wall bezel, front trim bor-

der, front dress panel, and pedestal base for installation of mdl 2 and 12 in configurations suitable for walk-up or drive-up use.

A heavy-duty enclosure is required. Two heavy-duty enclosures are available. A single function enclosure houses the currency dispensing mechanism on mdl 2 and 12 that do not have a depository. A dual function enclosure houses both the currency dispensing and the depository mechanisms on mdl 2 and 12 that have a depository. The dual function enclosure can also be used to house the currency dispensing mechanism only, on mdl 2 and 12 that do not have a depository. Both enclosures have a single rear access door that includes a combination lock and provides for a dial lock. The combination of the combination lock is set by the customer. The dial lock must be procured by the customer. A second combination lock is available as an optional feature. Both enclosures have a penetration-detection alarm grid across the inside of the front face. Construction of the heavy-duty enclosures meets requirements of UL291.

Pedestals are available in a number of sizes to mount the enclosure at a height most suitable for walk-up or drive-up use. The recommended nominal mounting heights are 1,308mm (51.5 in.) from keyboard centerline to walkway for walk-up use and 1,079mm (42.5 in.) from keyboard centerline to driveway for drive-up use. The difference in elevation between walkway or driveway and the mounting surface should be considered in selecting the pedestal height. Refer to "Installation Manual - Physical Planning", GA27-2766 and GA26-1658. A lockable storage cabinet with standard key is included with the pedestal when ordering a pedestal with the machine. A lockable storage cabinet only is also available that can be used with the dual function heavy-duty enclosure to mount the enclosure directly to a floor surface where a pedestal is not required.

A through-the-wall bezel, front trim border that fits around the bezel, and front dress panel that fits within the bezel are required. Two through-the-wall bezels are available: One with a recessed bezel providing a convenient shelf surface for user and recommended for a walk-up installation, and another with a non-recessed bezel positioning the user guidance area near the outside wall surface for more convenient use by a vehicle occupant and recommended for a drive-up installation. Two front trim borders are available: One with an envelope holder for depository transactions, and another without an envelope holder.

Warranty: These accessories are warranted free from defects in materials and workmanship for 90 days, commencing either on the date of installation or 30 days after shipment, whichever occurs first. IBM's obligation is limited to providing replacement parts on an exchange basis during the warranty period.

(APG only) Delivery Instructions: The "Heavy-Duty Enclosure" included in this group of accessories is a steel enclosure with dimensions of approximately 432 x 914 x 1575mm (17 x 36 x 62 in.) and weight approximately 950kg (2,100 lbs) for the dual function unit, and dimensions of approximately 432 x 914 x 991mm (17 x 36 x 39 in.) and weight approximately 680kg (1,500 lbs) for the single functions unit. The enclosure does not have casters and will be transported on a skid. <)

(AG only) Delivery Instructions: The 3624 mdl 2 and 12 will be shipped as three separate packages. The first package includes the heavy-duty enclosure, pedestal/storage cabinet and I/O module. This unit will be shipped on a pallet and will be 45"x 55"x 83" in total size. The total weight of the unit with pallet is approximately 3,500 lbs (3,100 lbs for 3624 without pallet).

The second package will contain the bezel and trim border. This is a palletized container weighing approximately 190 lbs and has dimensions of 59 x 45 x 24 in., including pallet.

The third package will contain miscellaneous ship items. This is a palletized container which may weigh as much as 250 lbs (depending on features and quantities ordered) and has dimensions of 50 x 42 x 40 in. including pallet. <)

The enclosure will be delivered under the normal delivery procedure but because of the dimensions and weight it is important that local provisions be made to have the enclosure delivered for physical installation at the selected site.

Close coordination should be maintained with the customer, the appropriate physical planning groups, and CE. Customer installation responsibilities should be noted as described in this section.

Bezel, Through-The-Wall, Recessed (#1490), Non-Recessed (#1491): (mdls 2, 12) (purchase only) Bezel for through-the-wall installation of 3624, #1490 is recessed, providing a shelf surface, and is recommended for walk-up installation. #1491 is non-recessed, placing the user guidance area nearer the outside wall surface for convenience of a vehicle occupant, and is recommended for drive-up installation. Prerequisites: #3901 or #3902, #3951, and #3961 or #3962. Field Installation: Yes. (AG only > Ordering: Order by feature number when ordering with a machine, otherwise order by P/N via MES. <)

Depository Cartridge (#3155): (mdls 2, 12) (purchase only) Portable container for receiving and transporting deposits. Required for operation with Depository Cartridge Locking Feature (#3150). Capacity of approximately 300 deposited envelopes (certain conditions could cause capacity to vary). Cartridge case is made of a high impact resistant, fire retardant material. Built-in carrying handle provides ease of loading transportation. Locking mechanism provides for customer insertion of keylock. The cartridge is loaded into the 3624 depository in the closed and locked condition. During loading, the locking mechanism in the depository unlocks and slides the cartridge door open without allowing access to the contents of the cartridge. During unloading, the locking mechanism slides the cartridge door closed and locks it before the cartridge may be removed from the 3624. Cartridges can be opened only by a companion key corresponding to the key in the 3624. There is also provision for affixing a seal to the locked cartridge. A mechanical counter, enclosed within the cartridge, is incremented each time the door is partially opened, providing an audit against unauthorized access.

Customer Responsibilities: The customer must be advised that:

1. The customer is responsible for procurement and installation of cartridge lock and for installation of the companion cartridge lock key in the 3624 depository locking mechanism.
2. The customer is responsible for determining required spare cartridges (see "Spares" below).
3. The customer is responsible for determining if the cartridge is the failing unit.
4. The customer is responsible for providing cartridge when required for CE 3624 depository maintenance and testing.
5. The Customer is responsible for replacement if required of the cartridge audit counter.
6. Purchaser agrees that IBM is relieved of responsibility for claims, including but not limited to, loss of currency or documents contained in or associated with the depository cartridge.
7. The Customer will be responsible for removing, controlling, and reloading all money and deposits in the 3624 when the unit has to be serviced by a CE.

Maintenance: Cartridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machines. Replacement, if required, of the security lock and the internal audit counter in the cartridge is the responsibility of the customer. IBM Maintenance Agreements are not available. If requested by the customer, CE can provide on-site service of the cartridge on a per call billable basis. A CE can perform those maintenance operations (normally performed by the customer) that are described in the "3624 Cartridge Owners Manual" (GA66-0005). IBM Repair Center service is not available.

Spares: To maintain continual depository operations at the ATM, at least two cartridges are required. Additional spares may be required, depending upon deposit, volume between scheduled unloadings such as over weekends, physical lo-

cation of 3624s, where cartridge contents are removed, where temporarily stored, and the needs for problem determination in the event of depository malfunctioning. A recommended nominal quantity of cartridges per 3624, including spares is shown below. It assumes for every depository cartridge loaded in a machine, another cartridge has been unloaded, emptied and made available. In addition, approximately one spare is available for every five 3624s. This should provide sufficient quantities of spares for customer and CE 3624 testing and for replacement of inoperative cartridges. These quantities should be adjusted to the customer's particular system requirements.

	Recommended Quantity									
3624s	1	2	3	4	5	6	7	8	9	10
Cartridges	3	5	7	9	11	14	16	18	20	22
(incl. Spares)										

Cartridges required for more than ten 3624s can be extrapolated from the above table by taking a multiple of these numbers.

Warranty: The cartridge is warranted free from defects in workmanship and material for a period of 90 days, commencing either on the date of installation or 30 days after shipment, whichever occurs first. Defective cartridges will be replaced under the warranty provisions.

Ordering: (AG only > Order by feature number and specify quantity when ordering with a machine; otherwise order by P/N via MES. <)

Dial Lock (#3310): (mdls 2, 12) (optional) (purchase only) Provides keylock for the combination dial on a heavy-duty enclosure. Can be used where dual control and/or bank examiner type lock is desired. When locked, the combination dial cannot be turned. Specify: #9251 for key removable when locked or unlocked, dial must be locked by key or #9253 for key removable when locked only, dial must be locked by key. Limitations: Installed on only one combination dial when Dual Lock (#3375) is also ordered. Maximum: One. Field Installation: No.

Currency Area Lockoff (#3312): (mdls 2, 12) (purchase only) Provides a security panel to enclose the currency area. Enables the document feed mechanism to be locked in the machine. When used with the Depository Cartridge Locking Feature (#3150), it restricts access to the currency area during normal operational servicing of the depository and/or other areas of the 3624. Includes keylock and standard key. Note: This accessory does not change the customer's responsibility to remove any currency in the 3624 when the unit has to be serviced by a CE if customer desires to change lock and/or key provided, customer is responsible for their procurement and installation. Limitations: Cannot be installed with Heavy-Duty Enclosure, Single Function (#3901). Maximum: One. Field Installation: Yes. (AG only > Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES. <)

Dual Lock (#3375): (mdls 2, 12) (optional) (purchase only) A second combination-lock for the rear access door of a Heavy-Duty Enclosure (#3901 or #3902). Field Installation: No.

Heavy-Duty Enclosure, Single Function (#3901): (mdls 2, 12) (purchase only) Used to enclose currency dispensing mechanism on 3624 mdls 2 or 12 that do not have a depository. Field Installation: No. Prerequisites: #1490 or #1491, #3951, and #3962.

Note: Pedestal (#4901), that includes a lockable storage cabinet, is available in several heights to mount the single function enclosure. Limitations: Cannot be installed with Depository, Through-The-Wall (#3243 or #3244), Pedestal for Dual Function Heavy-Duty Enclosure (#4902), Storage Cabinet for Dual-Function Heavy-Duty Enclosure (#4903), or Front Trim Border with Envelope Holder (#3961). Single Function Heavy-Duty Enclosure (#3901) cannot be field upgraded to a Dual Function Heavy-Duty Enclosure (#3902).

Heavy-Duty Enclosure, Dual Function (#3902): (mdls 2, 12) (purchase only) Used to enclose the currency dispensing and the de-

pository mechanisms on mdl 2 and 12 that have a depository. May also be used to enclose the currency dispensing mechanism only and provide spare lockable storage space on mdl 2 or 12 that do not have a depository. Note: Pedestal (#4902), that includes a lockable storage cabinet, is available in several heights to mount the dual function enclosure. A lockable storage cabinet only (#4903) is also available to mount dual function enclosure directly to a floor surface where a pedestal is required. Limitations: Cannot be installed with Pedestal for Single Function Heavy-Duty Enclosure (#4901), Heavy-Duty Enclosure (#3901). Prerequisites: #1490 or #1491, #3951, and #3961 or #3962. Field Installation: No.

Front Dress Panel (#3951): (mdls 2, 12) (purchase only) Provides panel to cover face of heavy-duty enclosure and I/O module. Prerequisites: #1490 or #1491, and #3901 or #3902. Field Installation: Yes. (AG only> Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES.<)

Front Trim Border, With Envelope Holder (#3961); w/o Holder (#3962): (mdls 2, 12) (purchase only) Provides trim paneling around the bezel to seal through-the-wall installation. #3961 includes built-in depository envelope holder and is available only when the depository feature is installed. #3962 does not include a depository envelope holder. Prerequisites: (1) Bezel, Through-the-Wall, Recessed or Non-recessed (#1490 or #1491). (2) Front Trim Border, With Envelope Holder (#3961) requires Depository, Through-the-Wall (#3243 or #3244). Field Installation: Yes. (AG only> Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES.<)

Pedestal, for Heavy-Duty Enclosures (#4901 or #4902): (mdls 2, 12) (purchase only) A mounting stand to locate the 3624 at a height most convenient for user operation. Includes a lockable storage cabinet. Available for single and dual function heavy-duty enclosures in heights appropriate for walk-up or drive-up use. Recommended nominal keyboard heights are 1,321mm (52.0 in.) for walk-up; 1,067mm (42.0 in.) for drive-up. #4901 is for 3624s that use the single function enclosure (#3901) and #4902 is for 3624s that use the dual function enclosure (#3902). Specify: For keyboard centerline height from mounting surface: #9701 for 1,079mm (42.5 in.), #9702 for 1,206mm (47.5 in.), or #9703 for 1,308mm (51.5 in.). Field Installation: Yes. (AG only> Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES.<)

Notes:

1. If single function enclosure is installed without a pedestal, the keyboard centerline is 368mm (14.5 in.) from mounting surface.
2. See Storage Cabinet for Dual Function Heavy-Duty Enclosure (#4903) for installing with keyboard centerline height lower than 1,067mm (42.0 in.) from mounting surface.

Storage Cabinet for Dual Function Heavy-Duty Enclosure (#4903): (mdls 2, 12) (optional) (purchase only) Lockable storage cabinet only, for mdl 2 or 12 dual function enclosure mounted directly to floor surface without pedestal. The keyboard centerline height is 965mm (38 in.) from mounting surface. A standard key is provided. Limitations: Cannot be installed with Heavy-Duty Enclosure, Single Function (#3901). Prerequisites: Heavy-Duty Enclosure, Dual Function (#3902). Field Installation: Yes. (AG only> Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES.<) Note: Storage cabinet is included with the Pedestal for dual Function Heavy-Duty Enclosure (#4902).

Pedestal, Lobby (#5510): (mdls 1, 11) (purchase only) A mounting stand for free-standing configuration of lobby mdl without the depository feature. Note: #5510 is not required if customer intends to install a mdl 1 or 11 without the depository feature on an alternative mounting surface or stand. #5510 is not required if a mdl 1 or 11 is installed with a depository feature (#3233), since a pedestal base is included in #3233. Field Installation: Yes. (AG only> Ordering: Order by feature number when ordering with a machine; otherwise order by P/N via MES.<)

Currency Cartridge (#9110 - P/N 945369): (purchase only) Portable currency container, interchangeable between 3624s. Cartridge case is made of a high-impact resistant, fire retardant material. Removable access cover and built-in carrying handle, for ease of

loading and transportation. Locking mechanism provides for customer installation of keylock and affixing security seals to transport of the cartridge. The cartridge is connected to a cartridge drive station in the 3624 for power and communication of cash-low and cash-out currency levels. A keying system is provided so that a match between the cartridge and the cartridge drive station must be satisfied before the cartridge can be properly loaded in the drive station. The maximum new bill capacity is 2,300 bills. The used bill capacity is approximately 2,000.

Customer Responsibilities: The customer must be advised that:

1. The customer is responsible for determining if the cartridge is the failing unit.
2. The customer should schedule the frequency of cleaning and belt replacement procedures for optimum cartridge performance according to the usage, to maintain maximum machine availability.
3. The customer may repair the cartridge, have repair work by the CE on-site where the on-site repair service is available, or he may send it back to the Repair Center (see "Maintenance" below).
4. The customer is responsible for determining required spares (see "Spares" below).
5. The customer is responsible for providing cartridges for CE 3624 maintenance and testing; a minimum of one spare cartridge for mdl 1 and two spare cartridges for mdls 11 and 12 must be made available by the customer to the CE for normal 3624 maintenance.
6. The customer is responsible for setting the keying system on the cartridges and drive stations so that there is the desired match of currency denomination to drive station.
7. Purchaser agrees that IBM is relieved of responsibility for all claims, including, but not limited to, loss of currency or documents contained in, dispensed by, or associated with the cartridge.

Spares: The customer may wish to replace (1) an empty or partially loaded cartridge with a fully loaded cartridge, (2) a failing cartridge with a spare for problem determination or while malfunctioning cartridge is being repaired, (3) A cartridge to enable the IBM CE to perform 3624 maintenance and testing. The customer should be advised to purchase sufficient cartridges to cover the above uses. The number of cartridges recommended is dependent upon the total number of cartridge drive stations the customer has installed, application requirements, physical location of 3624s, and location where cartridges are temporarily stored and loaded. The customer must be advised that it is recommended that spare cartridges should remain in use and not be stored for extended periods. A recommended quantity of spare cartridges and spare replacement belts per cartridge drive station is shown below. It assumes for every loaded cartridge installed in a cartridge drive station, another cartridge for the same currency denomination is available for currency replenishment. In addition, approximately one spare is available for every three cartridge drive stations of the same currency denomination. This should provide sufficient quantity of spares for customer and CE 3624 testing and for temporary replacement of cartridges in repair. These quantities should be adjusted to the customer's particular application requirements once he understands how his physical environment and usage affect cartridge and belt wear. The customer can replace separator and restraint belts in conjunction with performing the recommended operator cleaning and belt replacement procedure. Additional belts can be ordered from the Sale of IBM parts or MES/Part I.

RECOMMENDED MINIMUM QUANTITY OF SPARES AND REPLACEMENTS

Cartridge Drive Stations*	Recommended Quantity of Currency Cartridges	Separator Belt P/N	Restraint Belt P/N
		945307	945242

1	3	1	1
2	5	1	1
3	7	1	1
4	10	2	2
5	12	2	2
6	14	2	2
7	17	3	3
8	19	3	3
9	21	3	3
10	23	3	3

* 3624 Mdl's 1 and 2 have one cartridge drive station and mdl's 11 and 12 have two cartridge drive stations.

Cartridges and belts required for more than ten drive stations can be extrapolated from the above table by taking a multiple of these numbers. Additional quantities over the recommended minimum quantity of spare replacement belts should be ordered as required as part of the customer's periodic belt inspection and replacement schedule for cartridges (in conjunction with IBM's general recommendation).

Maintenance: Cartridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machine. A recommended operator cleaning and belt replacement procedure is provided in the "IBM 3624 Cartridge Owner's Manual", GA66-0005. Under adverse operating conditions, it is the customer's responsibility to modify the procedure to meet his own particular requirements. The customer can replace separator and restraint belts in conjunction with performing the recommended procedure. If the cartridge is in need of repair, the cartridge can be sent to the Country Receiving Center for Canada or the designated Repair Center for Japan; for all other countries, the repair will be done by the CE on-site on a time-and-material basis. In Canada and Japan, it is the customer's responsibility to package the unit in the designated shipping container and ship it prepaid to the service location.

An optional maintenance service is available on IBM Currency Cartridges which are used on the 3624 Consumer Transaction Facility. This IBM service offering provides for CEs to deliver IBM On-Site Repair service for Currency Cartridges which are used in conjunction with a 3624 which is 1) under warranty, 2) under IBM Maintenance Agreement, or 3) under the Agreement for Lease or Rental of IBM Machines.

IBM provides this additional service for IBM Currency Cartridges under an amendment entitled Amendment to the IBM Maintenance Agreement for Currency Cartridges Used with a 3624. An incremental charge for each IBM Currency Cartridge covered under the Amendment will be invoiced to Customers who elect to have this service. This charge will be billed by applying a four digit code, similar to a feature code, to one or more of the installed 3624 machines and will be included on the customers monthly maintenance invoice. The code for Currency Cartridge Maintenance Service is #5550.

If requested by the customer, CE can provide on-site service of the cartridge on a per call billable basis. CE can perform those maintenance operations (normally performed by the customer) that are described in the "3624 Cartridge Owners Manual" (GA66-0005). CE can also provide maintenance services that are provided by the Repair Center. For the CE to provide this service the customer must provide the CE contents of B/M 4801538 which includes the MIMS package, throat adjusting tool and cassette diagnostic tape. For IBM to provide cartridge servicing, the customer must provide a 3624 for testing of the repaired cartridge. It is recommended that the customer provide IBM with repair service facilities at a central site (rather than at a branch location). Note: Currency cartridge warranty service must be performed at the IBM Repair Center only.

IBM Repair Center Service: For cartridge repair, the customer will fill out an IBM Repair Authorization Form, GX27-2981, pack it and the defective cartridge in the designated shipping container, and ship it to the designated IBM Repair Center, where repair will be made if the cartridge is repairable. The charge for the repair of the cartridge at IBM repair Center will cover handling, inspection, cleaning, repair, adjustment, testing, and return shipping. Billing will be at IBM's applicable hourly rates. In addition, all parts needed will

be billed at IBM's prevailing parts prices. Alternately upon request, the IBM Repair Center will provide, for a minimum charge, an estimate of repair charges.

If, on the basis of an inspection, the repair center concludes that a cartridge is not repairable, no further work will be performed and the cartridge will be returned to the customer with a minimum charge to cover handling, inspection, testing, and return shipping charges.

Warranty: The cartridge is warranted to be free from defects in workmanship and material for a period of 90 days commencing either on the date of installation or 30 days after shipment, whichever occurs first. Warranty service for the cartridge will be performed at the IBM Repair Center for Canada and Japan, or on-site by the CE for all other countries. If warranty service is performed at an IBM Repair Center, the customer will fill out an IBM Repair Authorization Form, GX27-2981, pack it and the defective cartridge in the designated shipping container, and ship it prepaid to the designated IBM Repair Center. Ordering: Order by feature number below and specify quantity (AG only) when ordering with a machine; otherwise order by P/N via MES (<).

CURRENCY CARTRIDGE SUMMARY FEATURE

Canada	10,20 dollar	#2721
Venezuela	50,100 bolivares	#2721

Note: For cartridge parts, refer to the "IBM 3624 Cartridge Owners Manual", GA66-0005.

Logo Panel (#9401 or #9403): (purchase only) Backlighting Logo Panel, suitable for customization by silkscreening or other acceptable process.

If #9401 is ordered, logo panel(s) will be shipped with the 3624. Note: More than one panel may be ordered when #9401 is specified (e.g., customer may desire to order spares or to arrange to have several panels delivered with the first of several 3624s for customization at one time). When more than one panel is ordered using #9401, then #9403 should be specified on the other 3624s to avoid duplicating orders for logo panels.

If #9403 is ordered, the logo panel will not be shipped with the 3624 and must have been ordered separately by P/N, or as #9401 on another 3624.

Note: Additional Logo Panels can be ordered by P/N via IBM.

(AG only) Accessory Spares and Replacements

When ordering the following accessories as spares or replacements, order by part number via MES.

- P/N 0945618: Logo Panel for Mdl's 1,11
- P/N 0945617: Logo Panel for Mdl's 2,12
- P/N 4948345: Recessed Through-the-Wall Bezel and Front Trim Border With Envelope Holder
- P/N 4948347: Recessed Through-the-Wall Bezel and Front Trim Border Without Envelope Holder
- P/N 4948346: Non-Recessed Through-the-Wall Bezel and Front Trim Border With Envelope Holder
- P/N 4948348: Non-Recessed Through-the-Wall Bezel and Front Trim Border Without Envelope Holder
- P/N 0945454: Pedestal with cabinet for mdl's 2, 12 Dual Function 42 inch height for 1/2 inch safe
- P/N 0945455: Pedestal with cabinet for mdl's 2, 12 Dual Function 47 inch height for 1/2 inch safe
- P/N 0945456: Pedestal with cabinet for mdl's 2, 12 Dual Function 52 inch height for 1/2 inch safe
- P/N 0945458: Pedestal with cabinet for mdl's 2, 12 Single Function 42 inch height for 1/2 inch safe
- P/N 0945459: Pedestal with cabinet for mdl's 2, 12 Single Function 47 inch height for 1/2 inch safe
- P/N 0945460: Pedestal with cabinet for mdl's 2, 12 Single Function 52 inch height for 1/2 inch safe
- P/N 0945463: Pedestal for Mdl's 1, 11
- P/N 4757358: Storage Cabinet for Dual Function 1/2 inch Heavy Duty Enclosure

P/N 0945492: Storage Cabinet for Dual Function 1 inch Heavy
Duty Enclosure
P/N 4948356: Front Dress Panel for Heavy Duty Enclosure
Single Function
P/N 4948355: Front Dress Panel for Heavy Duty Enclosure
Dual Function
P/N 4795770: Depository Cartridge
P/N 0945626: Currency Area Lockoff
P/N 0945369: Currency Cartridge, US <
(Canada only > P/N 0945357: Currency Cartridge, Canada <)

Accessory Repair Parts

Repair parts are referenced in:

- IBM 3624 Consumer Transaction Facility Cartridge Owner's Manual, GA66-0005.
- IBM 3624 Consumer Transaction Facility Accessories Owner's Manual, GA66-0012.

IBM will not order customer requested parts, if these parts are not available at IBM.

Major Revision

3641 REPORTING TERMINAL

PURPOSE

The 3641 Reporting Terminal is an interactive workstation with a wide range of options to meet individual customer requirements for data entry and response.

MODELS

Model 1 001 Has a 22-character alphameric display. Either a 35-key numeric keyboard or 70-key alphameric keyboard feature must be specified. Optional features include a Magnetic Reader Attachment and a Digital Input/Digital Output with 32 input and 8 output points.

Prerequisites:

1. Either the 35-key numeric keyboard (#4652) or the 70-key alphameric keyboard (#4653) must be specified on the 3641.
2. A Loop Station Connector on a 3631/3632 or 3842/3843 loop, 4331 Loop Adapter or 8100 system loop.
3. Magnetic Reader Attachment (#4910) must be specified if either the Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader is ordered.

Note: When ordering this machine for attachment to an 8100 system, "Terminal Requirements" under the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system, the appropriate M4331 pages should be reviewed.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

The 3641 is an interactive workstation terminal that is designed to be used on a table, counter, work bench or mounted via an accessory bracket on a wall or column. Its capability includes:

- An easy-to-read display for input verification of keyed data and alphameric operator messages of up to 22 characters.
- Display of alphameric and special characters. The display character set includes graphics for many languages. The symbols displayed are governed by a translation table in the system controller -- see the 3641 description in the *3630 Plant Communication System Description* or *4331 Loop Adapter Description*.
- Function keys for user-defined transactions.
- Special features for fixed data input include a magnetic reader adapter.
- A Digital Input/Digital Output feature for the exchange of data between the 3641 and customer devices.
- A removable keyboard overlay and function key mask which can be customized by the customer.

Customer Setup: The 3641 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3641 at time of delivery or when relocating the 3641.
- Removing and packing of the 3641 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3641 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network.

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3641 terminals will normally be performed at the installed location.

There is no regularly scheduled IBM preventive maintenance. If purchased, the terminals are eligible for maintenance coverage

immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3641 and accessories may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning*, GA24-3675.

Publications:

IBM 3630 Plant Communication System, System Description, GA24-3652,
Introduction to the IBM 8100 Information System, GA27-2875

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

(Canada only+)

- Voltage (120V AC, 1-phase, 60 Hz): #9890 for locking plug, or #9891 for non-locking plug.

Note: 120V AC is compatible with existing 115V AC systems. +)

(Except Canada+)

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
220V #2813	120V #2802
240V #2801	

Note 1: 120V AC is compatible with existing 115V AC systems. 240V AC is compatible with existing 235V AC systems.

Note 2: A power cord and plug will be shipped from the plant of manufacture. The 3-digit country code in the DP Machine Order sheet will be used to select a power cord and plug of the specifications most commonly used in that country. A description of the plug and where-used list is provided in the *IBM 3630 Plant Communication System, Installation Manual- Physical Planning*, GA24-3675.

- Power Plug: If #2802, #2804, or #2730 voltage is specified, then #2714 (non-locking plug) or #2715 (locking plug) must be specified. +)
- Power Cable:
 - 1.8m (6 ft) cable - #9986
 - 4.3m (14 ft) cable - #9987
- Communication Cable: A communication cable (Loop Station Connector, LSC, cable) is provided for attachment to a direct-attached or data link-attached loop. Specify #9976 for a 1.8m (6 ft) cable or #9977 for a 4.3m (14 ft) cable.
- Color: Specify #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.
- Machine Nomenclature: Character set specification is not required.

Canadian French #2935	Portuguese (Brazil) #2933
English US #2750	Spanish Speaking #2931
Japanese #2930	

Note: When #2930, Japanese nomenclature, is specified, the display character set and keyboards include Katakana graphics.

MODEL CONVERSIONS (None)

3641 Reporting Terminal (cont'd)

SPECIAL FEATURES

Digital Input/Digital Output (#3251): Provides 32 bits of TTL-compatible digital input and 8 bits of TTL-compatible digital output on the 3641. **Maximum:** One. **Field Installation:** Yes.

35-Key Numeric Keyboard (#4652): Provides 15 customer-defined function keys, 5 control keys, 10 numeric keys and 5 special character keys. **Limitations:** Cannot be installed with #4653. **Maximum:** One. **Field Installation:** No.

70-Key Alphameric Keyboard (#4653): Provides 20 customer-defined function keys, 5 control keys, 10 numeric keys, A-Z, and 9 special character keys. **Limitations:** Cannot be installed with #4652. **Maximum:** One. **Field Installation:** No.

Magnetic Reader Attachment (#4910): Used to attach a Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader on the 3641. The two magnetic readers are plug compatible. **Maximum:** One. **Field Installation:** Yes.

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be preformed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a *Repair Center Machine Repair Authorization Form* (#2110), pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a time-and-materials basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time-and-materials basis at the Repair Center. Authorization Form #2110 applies.

Magnetic Hand Scanner: P/N 4123495.

**MAGNETIC SLOT READER
MAGNETIC SLOT READER, DUAL ENTRY**

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Number of Readers	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be preformed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a *Repair Center Machine Repair Authorization Form* #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a Time and Material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time and materials basis at the Repair Center. Authorization Form #2110 applies.

A Magnetic Reader attachment feature on the appropriate machine is required to use the Magnetic Slot Reader.

Magnetic Slot Reader: P/N 4123500 or feature code #9441.

Dual Entry Magnetic Slot Reader: P/N 4123520 or feature code #9442.

MAGNETIC READER/SCANNER EXTENSION CABLES

These cable assemblies can be used to extend the Magnetic Hand Scanner P/N 4123495 or Magnetic Slot Reader P/N 4123500 distances. Additional Extension Cable lengths other than those listed below are available. See RPQ Reference List.

MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. **Limitations:** Extension cables cannot be plugged into other extension cables. @SS@

Cable 6.0m (19.7 ft): P/N 4832986.

Cable 12.0m (39.4 ft): P/N 4832987.

MHS Handle and Feedback Assembly	4832701
MHS Amplifier Card and Cable Assembly	4832727
DEMSR/MSR Arm and Sensor Head Assembly	4832963
DEMSR/MSR Base and Feedback Assembly	4832973
DEMSR/MSR Amplifier Card and Cable Assembly	4832962
MSR Cover	4832964
DEMSR Cover	4123486

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking.

Magnetic Hand Scanner

Number of MHSs	Sensor Head Assemblies	Handle and Feedback Assembly	Amplifier Card and Cord Assembly
# 4123495	# 4832721	# 4832701	# 4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader

Number of MSRs	Arm and Sensor Head Assembly	Base and Feedback Assembly	Amplifier Card and Cord Assem	Cover
# 4123500	# 4832963	# 4832973	# 4832962	# 4832964
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Dual Entry Magnetic Slot Reader

Number of DEMSRs	Arm and Sensor Head Assembly	Base and Feedback Assembly	Amplifier Card and Cord Assem	Cover
# 4123520	# 4832963	# 4832973	# 4832962	# 4123486
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Ordering Instructions: See IBM.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

WALL MOUNTING BRACKETS

A 2-piece mounting bracket is available to mount the 3641 Reporting Terminal to a wall, column, or other vertical surface.

One piece mounts on the 3641 and the other mounts on the vertical surface. There are four bracket holes on the back of the 3641 and four mounting screws supplied with the brackets. The customer is responsible for supplying the fasteners for the wall bracket.

Ordering Instructions: See IBM.

Warranty: Wall mounting brackets are warranted free from defects of workmanship and materials for 90 days.

Wall Mounting Brackets: P/N 4151768 or feature code #9450.

SUPPLIES

None required with machine order. Supplies may be ordered through IBM.

3642 ENCODER PRINTER**PURPOSE**

A workstation printer and magnetic stripe encoder which produces turn around documents. The magnetic stripe on the documents encoded by the 3642 can be read by the Magnetic Hand Scanner and the Magnetic Slot Reader.

MODEL 2

Model 002: Has ten print lines and allows the automatic feeding of continuous forms as well as hand feed operation.

Prerequisites: A Loop Station Connector installed on an IBM Multi-use Communications Loop. See "Accessories".

Note: When ordering this machine for attachment to an 8100 system, the appropriate M8130, 8140 or 8101 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system, the appropriate M4331 pages should be reviewed.

Customer Setup: Machine only. The 3642 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility. For additional information on CSU refer to the General Information section.

HIGHLIGHTS

The 3642 is designed to produce magnetic stripe documents at a workstation. Its capability includes:

- Prints and encodes magnetic striped cards and labels.
- Prints 10 lines of up to 70 alphanumeric characters each.
- Encodes alphanumeric data.
- Hand feed or automatic feed documents.
- Large printed-character option.

Automatic Feeding And Bursting: The Automatic Feed and Burst capability permits unattended operation. It provides a forms burster and a hopper which holds up to 400 continuous forms. A forms stacker which holds up to 400 cut forms is standard. All continuous forms are automatically burst prior to encoding and printing. The Automatic Feed and Burst capability is designed to burst 99 pound card stock and adhesive backed labels. It is not designed to burst 150-pound tag stock.

Document Speed: The document speed of the 3642 depends on the data printed and the forms size and will have to be evaluated for each application. The machine speed for a typical document is eight documents per minute.

Document Description: The 3642 contains a printer and magnetic stripe encoder that can print and encode on the following documents.

Document Sizes:

Height: 8.26cm (3.25 in.)
Length, Min: 12.7cm (5.00 in.)
Length, Max: 18.733cm (7.375 in.)

Document Types:

99 pound Card Stock
150 pound White Tag Stock
Pressure Sensitive Labels

Document Thickness:

Min.: 0.018cm (0.007 in.)
Max.: 0.030cm (0.011 in.).

See "Forms Design Reference Guide", GA24-3488, for more details on the 3642 Encoder Printer forms.

Character Sets: The 48 printed character set consists of 0-9, A-Z, and appropriate special characters as defined by country requirements.

A Katakana character set is available at time of manufacture which will allow the printing of Katakana only on specified lines. See "Specify."

A special (Large Character) 48-character set available at time of manufacture provides 0-9, A-Z, slash (/), minus (-), and decimal (.), and 9 special characters for creating large printed characters. See "3630 Plant Communications System Description" for details. (Canada only) > The large character set has two options:

- Large-character printing on the first 4 lines only - normal character printing on the last 6 lines.
- Large-character printing on all 10 lines. <)

The 63-character magnetically encoded character set consists of 0-9, A-Z, and 27 special characters.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3642 at time of delivery or when relocating the 3642.
- Removing and packing of the 3642 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3642 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network (see "Accessories").

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: The standard maintenance agreement as described in the General Information section applies to the 3642 terminals.

Maintenance of the 3642 terminals will normally be performed at the installed location. See "Use of IBM Equipment in Industrial Environments" in GI section.

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environment: The 3642 may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments. It can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.

- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the "IBM 3630 Plant Communication System, Installation Manual - Physical Planning", GA24-3675.

Publications: "Forms Design Reference Guide for Printers", GA24-3488; "IBM 3630 Plant Communication System, System Description", GA24-3452; "Introduction to IBM 8100 Information System", GA27-2875; "Guide to the IBM 4331 Processor", GC20-1878; "IBM 4331/3640 Information Handbook"; "IBM 3642 Encoder Printer Operating Guide", GA24-3680.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): #9890 for locking plug, or #9891 for non-locking plug.

(Canada only > Note: 120V AC is compatible with existing 115V AC systems.<)

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
220V #2813	120V #2802
240V #2801	

Note 1: 120V AC is compatible with existing 115V AC systems. 240V AC is compatible with existing 235V AC systems.

Note 2: A power cord and plug will be shipped from the plant of manufacture. The 3-digit WT A/FE country code in the DP machine order sheet will be used to select a power cord and plug of the specifications most commonly used in that country. A description of the plug and where-used list is provided in the IBM 3630 Plant Communication System, Installation Manual-Physical Planning, GA24-3675.

- Power Plug: If #2802, #2804, or #2730 voltage is specified, then #2714 (non-locking plug) or #2715 (locking plug) must be specified.
- Power Cable:
 - 1.83m (6 ft) cable - #9986
 - 4.3m (14 ft) cable - #9987
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify #9976 for a 1.8m (6 ft) cable or #9977 for a 4.3m (14 ft) cable.
- Color: Classic blue - #9063; charcoal brown - #9064; pebble gray - #9065.
- Machine Nomenclature:

Canadian French #2935
English US #2750
Japanese #2930
Portuguese (Brazil) #2933
Spanish Speaking #2931

- Character Set Groups:

#2845 - EBCDIC
#2955 - Japan
#2956 - United States
#2961 - Spanish Speaking
#2970 - France

#2975 - Brazil
#9402 - Large-Character lines 1-10

A Katakana feature will be available on the 3642 at time of manufacture only. It will allow the intermix of Katakana-only character set and the Japan character set. The following are available combinations:

#2774 - Katakana on line 1 only.
#2775 - Katakana on line 1, 2, and 3.
#2776 - Katakana on line 8, 9, and 10.
#2777 - Katakana on line 2, 4, 6, 8, and 10.

Note: Line 1 is the top line.

If a customer desires other Katakana print line positions, an RPQ may be submitted at order time. RPQs to change print line positions will not be accepted after manufacture and shipment to the customer.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

Loop Accessories: A group of accessory products are offered to permit plant electricians or contract personnel to install the loops. Refer to IBM Multi-use Communications Loop Planning and Installation Guide, GA23-3341, for information necessary to plan the layout and for selection of the loop hardware, for Installation and Testing information.

Loop Splice Plate (LSP): The LSP splices together two segments of indoor cable or provides a connecting point for future expansion of the loop. The LSP consists of a single connector strip, to which the incoming loop cable and the outgoing loop cable can be attached; it is installed in a standard outlet box for business office environments, or weatherproof outlet box for industrial environments.

Loop Station Connector (LSC): The LSC is available as two unique types: Wrap and radial. The wrap LSC attaches an I/O unit or controller directly to the main loop cable; the radial LSC attaches an I/O unit only through an LWC to the loop. The wrap LSC attaches an incoming and outgoing loop cable; the radial LSC attaches at the end of one loop cable from the LWC.

The wrap LSC also offers the isolation feature of wrapping, which allows the customer to wrap the loop away from a loop wiring failure or to reconfigure the loop during alterations. Both wrap and radial LSCs contain bypass relays that bypass the I/O unit when the I/O unit is powered-off or disconnected. These accessories are installed in a standard or weatherproof outlet box.

2 X 4 Adapter Plate (2AP): The 2" X 4" Adapter Plate is used with the Loop Station Connector and accommodates the use of standard outlet boxes that have dimensions smaller than the outlet boxes defined in the Loop Installation and Planning Guide. It is not to be used with the environmental outlet boxes.

Loop Wiring Concentrator (LWC): The LWC provides the facility to attach a cluster of I/O units without a large number of drops on the loop cable. It attaches up to eight radial LSCs at the end of loop cables called radials. The point where a radial line terminates at the LWC is called an LWC port. Not all ports have to be used; unused ports can be reserved for future expansion.

The LWC has the same wrapping capability as the wrap LSC. In addition, the LWC allows the customer to bypass one or more of the radials by setting a corresponding switch located inside the LWC.

The LWC has its own enclosure or can be mounted in a NEMA-4X environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Loop Surge Suppressor (LSS): The LSS allows the loop to be run across an outdoor space to another building. It attaches two outdoor cables and two indoor cables, allowing the proper termination and grounding for each type of cable. In addition, the LSS contains four surge protectors, one for each twisted pair in the two outdoor cables, to protect from voltage surges caused by near strikes of lightning. There is no protection in the LSS from a direct lightning strike.

The LSS has its own enclosure or can be mounted in an environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Continuity and Relay Tester: The Continuity and Relay Tester is used with a customer supplied volt-ohm meter, capable of reading 0.5 ohms and rated at least 5000 ohms/volt, to verify the loop installation, including loop cabling and accessories, after completion. By plugging the tester into any loop station connector and connecting the volt-ohm meter to the tester, the condition of the wire segment being tested can be determined as to conductor and shield continuity (opens or shorts), wrap switch operation, and total lobe resistance.

The loop station connector relays are also activated and their operation verified with this tester.

* For use with NEMA-4X enclosure and associated parts (used when installing in harsh environments) or as a replacement part for the LWC or LSS.

** 1 package (10 keys) shipped with each 3631. 1 key shipped with each LWC and wrap LSC.

Ordering Instructions: Order via MES from location indicated above. When ordering use Machine type 3631.

Warranty: All loop accessories are warranted free from defects of workmanship and materials for 90 days.

Customer Responsibilities: The customer is responsible to provide (purchase, install, test, and maintain) the loop cables and accessories for terminal attachments. However, contact IBM for details of IBM services available to assist the customer with installation. The customer is also responsible for procuring and stocking spare cable and spare parts for loop accessories. See "IBM Multi-use Communications Loop Planning and Installation Guide", (GA27-3341) for a suggested schedule to allow the customer to plan, install, and test the loop cable and accessories prior to delivery of the system.

It is recommended that the customer order additional loop components for spares with the initial order, as spares will not be stocked in the Branch Office.

To enable a customer to test his installed loops, it is recommended that the customer order a Continuity and Relay Tester. Testing the loop wiring will require the tester or its equivalent.

SUPPLIES

None required with machine order. Supplies may be ordered through your IBM NDD Sales Representative for initial and replacement quantities.

3643 KEYBOARD DISPLAY

PURPOSE

A combination keyboard and gas panel display terminal for input and output in interactive 3630 Plant Communication System applications and when attached to a 4331 processor or an 8100 system.

MODELS

Model 4 004: Displays 1,024 characters -- 16 rows of 64 characters. Keyboard consists of alphameric, control, and function keys.

Prerequisites:

1. Either the Alphameric Keyboard (#4772) or the Expanded Alphameric Keyboard (#4774) must be selected to complete the order, see "Special Features".
2. A Loop Station Connector installed on an IBM Multiuse Communications Loop, see "Accessories".
3. Magnetic Reader Attachment (#4910) must be specified if either the Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader is to be attached.

When ordering this machine for attachment to an 8100 system, section "Terminal Requirements" in the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system the M4331 pages should be reviewed.

Customer Setup (CSU): Machine only. The 3643 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

HIGHLIGHTS

- Gas panel display with buffer.
- Keyboard options to meet input requirements.
- Operates with manufacturing application programs.
- Accesses control functions.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3643 at time of delivery or when relocating the 3643.
- Removing and packing of the 3643 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3643 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3643 terminals will normally be performed at the installed location.

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3643 may be used in industrialized work zones of a wide range of business, industrial and commercial establishments.

It can resist:

- Concentrations of certain common, corrosive gases.
- Concentrations of dust, grit and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with shipping, placement, operation and relocation of the terminal for most types of industries.

For environmental specifications refer to the "IBM 3630 Plant Communication System, Installation Manual - Physical Planning", (GA24-3675).

Publications: "IBM 3630 Plant Communication System, System Description", (GA24-3652) -- "Introduction to the IBM 8100 Information System", (GA27-2875) -- "Guide to the IBM 4331 Processor", (GC20-1878) -- "IBM 4331/3640 Information Handbook" -- "IBM 3643 Keyboard Display Operating Guide", (GA24-3681).

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- (Canada only > Voltage (120V AC, 1-phase, 60 Hz): #9890 for locking plug, or #9891 for non-locking plug. Note: 120V AC is compatible with existing 115V AC systems. <)
- (Except Canada > Voltage (AC, 1-phase):

50 Hz	60 Hz
100V - #2804	100V - #2730
220V - #2813	120V - #2802
240V - #2801	

Note 1: 120V AC is compatible with existing 115V AC systems. 240V AC is compatible with existing 235V AC systems.

Note 2: A power cord and plug will be shipped from the plant of manufacture. The 3-digit country code in the DP machine order sheet will be used to select a power cord and plug of the specifications most commonly used in that country. A description of the plug and where-used list is provided in the IBM 3630 Plant Communication System, Installation Manual -- Physical Planning, GA24-3675.

- Power Plug: If #2802, #2804, or #2730 voltage is specified, then #2714 (non-locking plug) or #2715 (locking plug) must be specified. <)
- Power Cable:
 - 1.8m (6.0 ft) cable - #9986
 - 4.3m (14.0 ft) cable - #9987
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct

attached or data link-attached loop. Specify #9976 for a 1.8m (6.0 ft) cable or #9977 for a 4.3m (14.0 ft) cable.

- Color: Classic blue #9063 -- charcoal brown #9064 -- pebble gray #9065.

- Machine Nomenclature:

Canadian		Portuguese	
French	#2935	(Brazil)	#2933
English US	#2750	Spanish	
Japanese	#2930	Speaking	#2931

- Keyboard Character Set:

Brazilian	#2975	Japanese	
English US	#2956	Katakana	#2973
French	#2970	Spanish	
		Speaking	#2961

SPECIAL FEATURES

Keyboards -- All keyboards will have a combination of preengraved and non-engraved keytops. For the non-engraved function keys, each 3643 will be provided with three sets of self-adhesive keytop labels. One set will be preprinted with commonly-used function nomenclature and will have a protective plastic coating applied. Also, a set of blank labels will be provided so that the user may create his own labels. A clear plastic overlay set will provide a protective cover for the blank label set.

Alphanumeric Keyboard (#4772): A 54 key-character alphanumeric section pre-engraved as a typewriter keyboard to the left of a function/transaction keypad. (77 keys in Japan, 74 keys in other languages.) Limitations: Cannot be installed with Expanded Numeric Keyboard (#4774). Maximum: One. Field Installation: No.

Expanded Alphanumeric Keyboard (#4774): Same as #4772; except that function/transaction keypad has 20 additional non-engraved keys (15 for Japan). Limitations: Cannot be installed with keyboard (#4772). Maximum: One. Field Installation: No.

Magnetic Attachment (#4910): Permits attachment of Magnetic Hand Scanner or Magnetic Slot Reader. The Magnetic Hand Scanner, Magnetic Slot Reader and Dual Entry Magnetic Slot Reader are plug compatible. Limitations: Cannot be installed with Magnetic Badge and Document Encoder (#4920). Maximum: One. Field Installation: Yes.

Magnetic Badge And Document Encoder (#4920): Provides a magnetic slot reader/encoder unit that records alphanumeric data on magnetic striped badges and documents. Also has the capability to read data from magnetic striped media. Limitations: Cannot be installed with Magnetic Attachment (#4910). Maximum: One on mdl 2, 3 or 4. Field Installation: Yes, on machines shipped after September 1981.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Magnetic Hand Scanner: P/N 4123495

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic

reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures. The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days. In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a time-and-material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time-and-materials basis at the Repair Center. Authorization Form #2110 applies.

Magnetic Slot Reader: P/N 4123500 or Feature Code #9441.

Dual Entry Magnetic Slot Reader: P/N 4123520 or Feature Code #9442.

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

MACHINES

M 3643.3
NOV 85

----------------------	---------------------

50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form, #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a time-and-material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time-and-materials basis at the Repair Center. Authorization Form #2110 applies.

Note: A Magnetic Reader attachment feature on the appropriate machine is required to use the Magnetic Slot Reader.

Magnetic Reader/Scanner Extension Cables

These cable assemblies can be used to extend the Magnetic Hand Scanner P/N 4123495 or Magnetic Slot Reader P/N 4123500 distances. Additional Extension Cable lengths other than those listed below are available. See RPQ Reference List. MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. Limitation: Extension cables cannot be plugged into other extension cables.

Ordering Instructions: See IBM.

DEMSR/MSR Amplifier Card and	

Cable Assembly	4832962
MSR Cover	4832964
DEMSR Cover	4123486

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking.

Magnetic Hand Scanner

Number of MHSs	Sensor Head Assembly	Handle and Fdbk Assembly	Amp Card and Cord Assembly
#4123495	#4832721	#4832701	#832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader

Number of MSRs	Arm and Sensor Head Assembly	Base and Feedback Assembly	Amp Card and Cord Assembly
#4123500	#4832963	#4832973	#4832962
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Customer may need one (1) replacement for Cover (#4832964)

Dual Entry Magnetic Slot Reader

No. of DEMSRs	Arm and Sensor Head Assembly	Base and Feedback Assembly	Amp Card and Cord Assembly
#4123520	#4832963	#4832973	#4832962
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Customer may need one (1) replacement for cover (#4123486)

Ordering Instructions: See IBM.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

SUPPLIES (NONE)

3644 AUTOMATIC DATA UNIT

PURPOSE

The 3644 Automatic Data Unit attaches to the 3631 or 3632 controller, an 4331 MDL Group 1 or 2 or an 8100 system via their loop features to provide system connection to a variety of distributed sensors, actuators, and production and laboratory equipment.

MODELS

Model 1 001

Limitations: The analog input function requires multiple Sensor I/O cards. If analog input or current loop is installed, some card-socket usage restrictions exist. The Analog Amplifier card should be installed only in 3644s containing the necessary prerequisite EC. Analog input and RS232C/CCITT V.24 Communications cannot both be installed in the same 3644. The Communications Adapter Card is not supported by the 3630 host services 3644 translation services program. See M10000 pages for details.

Prerequisites:

1. When the 3644 is installed on the 8100 system via the IBM Multiuse Communications Loop, the 8100 system will generate the parameter tables.

Note: When ordering this machine for attachment to an 8100 system, the appropriate 8101, 8130 or 8140 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

2. A Loop Station Connector installed on an IBM Multiuse Communications Loop. See "Loop Accessories" in the 3630 or 8100 machine pages.

3. When the 3644 is installed on the 4331 Loop Adapter the 4331 processor will generate the parameter tables.

Customer Setup: Machine only.

HIGHLIGHTS

Provides:

- Power and housing for Sensor I/O cards
- Distributed attachment of user equipment
- Analog and digital attachments
- Bit serial asynchronous current loop and RS232C/CCITT V.24/V.28
- User-defined scan controls, data transmission and logic processing.

Customer Setup: The 3644 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3644 at time of delivery or when relocating the 3644; this includes the Sensor I/O cards.
- Removing and packing of the 3644 at time of discontinuance.
- Using and following the problem determination procedures of the 3644 and filling out the trouble report prior to calling for service.
- Executing the problem determination procedures for the Sensor I/O cards, determining the failing card, and mailing it to the honoring IBM location.
- Maintenance of the process sensors, actuators, and wiring.
- Determining requirements for and stocking spare Sensor I/O cards.
- Creating the parameter tables that direct the operation of the 3644.
- Installation and physical planning for the 3644. IBM assistance in determining the suitability of the industrial environment for the 3644 installation is available.
- Relocation of the 3644 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network.

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.

- Whether terminal, loop, controller, or sensor I/O cards are at fault.
- Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3644 terminals will normally be performed at the installed location. There is no regularly scheduled IBM preventive maintenance.

Warranty service of the Sensor I/O cards will be performed at the honoring IBM location.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments:

The 3644 mdl 1 and its Sensor I/O cards may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the and *IBM 3630 Plant Communication System, Installation Manual - Physical Planning*, GA24-3675.

SPECIFY

Unless otherwise indicated, these specify features are only available at of manufacture.

(Canada only+)

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

Note: 120V AC is compatible with existing 115V AC systems. +)

(Except Canada+)

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V - #2804	100V - #2730
220V - #2813	120V - #2802
240V - #2801	

Note 1: 120V AC is compatible with existing 115V AC systems. 240V AC is compatible with existing 235V AC systems.

Note 2: A power cord and plug will be shipped from the plant of manufacture. The 3-digit country code in the DP machine order sheet will be used to select a power cord and plug of the specifications most commonly used in that country. A description of the plug and where-used list is provided in the *IBM 3630 Plant Communication System, Installation Manual- Physical Planning*, GA24-3675. +)

- Power Plug: If **#2802**, **#2804**, or **#2730** voltage is specified, then **#2714** (non-locking plug) or **#2715** (locking plug) must be specified.
- Power Cable:
 - 1.8 meter (6 foot) cable - **#9986**
 - 4.3 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct

3644 Automatic Data Unit (cont'd)

attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.

- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065**.
- Machine Nomenclature:
 - Canadian French **#2935** Portuguese (Brazil) **#2933**
 - English **#2750** Spanish Speaking **#2931**
 - Japanese **#2930**
- Distribution of 3644 Microcode: The 3644 microcode is required at each S/370, 4331 or 8100 system location. The address for the initial shipment must be supplied as shown below.

The following four steps are to be taken when ordering 3644 microcode:

- 1) To identify what the 3644 is attached to specify:
 - #9415** - when attached to 8100
 - #9416** - when attached to 3631, 3632
 - #9417** - when attached to 4331 Loop Adapter
- 2) To specify the desired media when attached to a 3631, 3632, or 4331 Loop Adapter specify:
 - #9412** - 9/800 magnetic tape
 - #9413** - 9/1600 magnetic tape
 - #9414** - 9/6250 magnetic tape
- 3) To indicate the presence of the MIO feature (**#4905**) when attached to a 3631, 3632, or 4331 loop adapter, specify:
 - #9491** - for initial 3644 on the system without MIO feature
 - #9492** - for initial 3644 on the system with MIO feature (**#4905**).
 - #9493** - for any additional 3644s on the system.
- 4) For 3644's attached to an 8100 specify:
 - #9493** - for any additional 3644s.
 - #9494** - for the first 3644

Shipping address for 3644 microcode must be supplied exactly as follows:

Note: When ordering the first 3644 and it is remote from the host, specify **#9596**.

1. When the host is not an 8100 system, send to the host (for example, S/370) location:

Line 1 - IBM Programming Support Representative
Line 2 - c/o (Customer Name)
Line 3 - Street Address (or P.O. Box)
Line 4 - City, Country, Postal Code
Line 5 - Attention: Data Processing Manager

2. When the host is an 8100 system, send to the 8100 location:

Line 1 - Customer Name
Line 2 - Street Address (or P.O. Box)
Line 3 - City, Country, Postal Code
Line 4 - Attention: Data Processing Manager

SPECIAL FEATURES

Manual I/O (#4905): Provides a 22-character display and a 35-key numeric/function keypad. Allows inquiry into customer data and status contained in 3644 storage when online to the 3630, 4331 or 8100 system. When offline, additionally allows modification of customer data locations to effect operator control of 3644 operation. **Maximum:** One. **Field Installation:** Not recommended.

weeks

MODEL CONVERSIONS (None)
ACCESSORIES
SENSOR I/O CARDS

16-Point Non-Isolated DI: Provides 16 non-isolated input points for connection to user voltage or contact sense signals. Each point provides a high level and a low level sense capability. Input parameters are:

Contact Sense	Low Level	High Level
Logical 1	≤ 2K Ohms	≤ 5K Ohms
Logical 0	≥ 50K Ohms	≥ 100K Ohms
Voltage Sense	Low Level	High Level
Logical 1	- 24.0 to + 1.0V DC	0 to + 9.0V DC
Logical 0	+ 2.5 to + 24.0V DC	+ 22.5 to + 52.8V DC

16-Point Isolated DI: Provides 16 points of optically isolated digital input for connection to user signals. 250V DC isolation is provided between user signals and the 3644. Each point provides a high level and a low level voltage - sense capability. Input parameters are:

	Low Level	High Level
Logical 1	+ 2.0 to +12.0V DC	+12.0 to +52.8V DC
Logical 0	- 12.0 to + 0.8V DC	- 52.8 to + 0.8V DC

16-Point Non-Isolated DO: Provides 16 NPN transistor switches in a grounded emitter configuration for switching user-provided DC power to user-provided devices. Each switch is capable of sinking .250 amps from a 52.8 volt source through a resistive load. A logical 1 written into the control register will cause the transistor to turn on. Maximum voltage drop in the on state is 0.4 volts at load currents up to 20 milliamperes and 0.6 volts at load currents up to .250 amps. If no user voltage source is attached, the card will supply an off state voltage of 5.5 volts maximum at 0 amps, and 2.4 volts minimum at .001 amps.

16-Point Isolated DO: Provides 16 NPN transistor switches in an open collector, open emitter configuration for switching user-provided DC power to user-provided devices. 250V DC or peak AC isolation is provided between each switch and the 3644. Each transistor switch is capable of switching up to .250 amp from a 52.8 volt source to a resistive load. A logical 1 written into the control register will cause the switch to turn on. Maximum voltage drop in the on state is 0.4 volts at load currents up to 20 milliamps and 0.6 volts at load currents up to 250 milliamps. Consult *3644 Component Description Manual* for limitations on the number of Isolated DO cards per 3644.

Analog/Digital Converter: Provides an 11-bit plus sign (12 bit total), 5 volt bi-polar successive approximation analog to digital converter with a zero correction logic section that reduces errors caused by component aging and temperature induced offset drift. Note that the ADC must be used in conjunction with at least one multiplexer card to provide for connection of signal wires. Additional multiplexer cards may be installed to provide a greater multiplexing capability. The ADC card must be installed in the 3644 card socket 1 if it is used. Analog Input Subsystems cannot be installed if Communication Adapter Card(s) are installed.

Analog 7 Range Amplifier: Provides a 7 range programmable gain instrumentation amplifier for low level analog input signals. Gains of 1, 10, 25, 50, 100, 250 or 500 may be selected for each analog input point. This extends the range of the ADC to ±10mv, ±20mv, ±50mv, ±100mv, ±200mv, ±500mv or ±5v full scale. The Analog Amplifier also converts the 16-point Solid State Multiplexer card from single ended to differential operation. The Analog Amplifier must be installed in Socket 2 if it is used.

The Analog Amplifier should be installed only in 3644's having the prerequisite noise reduction EC's. These EC's are factory installed in 3644's starting at Serial 0010077. Earlier 3644's may be upgraded with field installable EC 755840.

Note: A calibration tool to aid in ADC and Analog Amplifier calibration is available as RPQ S00399.

8-Point Reed Relay Multiplexer: Provides eight 3-wire connections for shielded differential analog input signals. Provides eight-way multiplexing for the ADC. Flying capacitor switching is used to provide + or - 200 volt common mode tolerance and reduce the influence of common mode voltage to unmeasurable levels at reference conditions. The reed relay multiplexer can switch signal voltages ranging from -0.5 to +5 volts. Multiplexer cards must be installed in contiguous socket locations, starting with socket 2 if no Analog Amplifier is installed, or with socket 3 if an Analog amplifier is installed. Reed Relay and Solid State Multiplexers may be intermixed.

3644 Automatic Data Unit (cont'd)

16-Point Solid State Multiplexer: Provides sixteen 3-wire connections for shielded analog input signals. Provides 16-way multiplexing for the ADC. Solid state FET switches can handle signals ranging from -5 to +5 volts. If used without the Analog Amplifier, single ended operation is provided with the analog signals referenced to 3644 ground. If used with the Analog Amplifier, differential input operation is provided with a common mode tolerance of ± 10 volts. Multiplexer cards must be installed in contiguous socket locations, starting with socket 2 if no Analog Amplifier is installed, or with socket 3 if an Analog Amplifier is used. Reed Relay and Solid State Multiplexers may be intermixed.

Current Loop Receiver/Transmitter: Provides two transmitters and two receivers for modulating and demodulating a 20 milliamp current flow. Switches are provided on the card to select speed (110, 150, 300, 600, 1200 baud), number of data bits (5, 6, 7, 8), parity (odd, even, none), and number of stop bits (1, 2). A variety of start/stop codes over a wide range of speeds is available to allow connection to bit-serial devices. Consult the *3644 Component Description Manual* for limitations on the number of Current loop cards per 3644.

Communications Adapter: Provides two bidirectional asynchronous RS-232-C/CCITT V.24/V.28 compatible attachment points for RS-232/CCITT V.24/V.28 compatible terminal equipment. Switches are provided on the card to select speed (110/134.5, 150, 300, 600, 1200 Baud), number of data bits (5, 6, 7, 8) parity (odd, even, none), and number of stop bits (1, 1.5, 2). 3644 support is provided for simplex, half duplex, and duplex channel configurations. The Communications Adapter Card cannot be installed in 3644's using the Analog Input Subsystem. The Communications Adapter Card is not supported by the 3630 Host Services 3644 Translation Services program.

FEATURE SUMMARY

Description	P/N
16-Point Non-Isolated DI Card	4152582
16-Point Isolated DI	4152581
16-Point Non-Isolated DO	4152583
16-Point Isolated DO	8333198
Analog/Digital Converter(ADC)	4152586
Analog 7 Range Amplifier	4152587
8-Point Reed Relay Multiplexer	4152584
16-Point Solid State Multiplexer	4152585
Current Loop	
Receiver/Transmitter	4152580
Communications Adapter	5680857

Ordering Instructions: For ordering for delivery with machine, see appropriate "Machines" pages.

Warranty: Each 3644 Sensor I/O card is warranted to be free from defects in materials and workmanship for a period of 90 days, starting either on date of shipment or on date of installation or 45 days after installation, whichever comes first. IBM at its option will repair or replace the defective accessory.

Warranty will be honored at the IBM Branch Office, except in Canada. The customer is responsible for executing the problem determination procedures for the Sensor I/O cards and determining the failing card. In Canada, the customer mails the Sensor I/O card to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7
Canada

Cards that have been modified and cards that have been damaged through improper installation, handling, or failure to provide a suitable installation environment will not be accepted for warranty service. IBM shall be the sole judge of whether or not a card meets warranty requirements.

Spare unit requirements are a function of the customer's application, the total number of 3644s installed, and the range of Sensor I/O card types installed. Spare unit stocking considerations are:

- At least one spare for each type of Sensor I/O card installed at a customer site.
- Where multiples of a single Sensor I/O card are installed, one spare for each eight active cards.

Each customer will have to determine his own unique spare requirements.

SENSOR I/O CARDS ATTACHMENT ACCESSORIES

Process Termination Block: Attaches to the end of the Sensor I/O card to provide a screw-down termination facility for process signals and to retain the card in the 3644 housing. Each installed card with the exception of the analog-digital converter must be equipped with a process termination block.

Accessory Socket Cover: Covers unused sensor card locations in the 3644 to minimize entry of airborne contaminants. One cover is required for each unused sensor card location. A cover is also used to retain the ADC.

Communications Adapter Cable: Provides translation at the 3644 process termination block to a standard EIA connector. The Adapter Cable is 20 inches (508 cm) long with ring connectors on one end and a female EIA DB-25 connector on the other end.

Description	P/N
Process Termination Block	4152588
Accessory Socket Cover	4152589
Communications Adapter Cable	5680861

Ordering Instructions: For ordering for delivery with machine, see appropriate "Machines" pages. A

Warranty: The 3644 Attachment Accessories are warranted free from defects in workmanship and materials for 90 days.

SUPPLIES (None)

3645 PRINTER

PURPOSE

A receive-only printer for printed output in interactive 3630 Plant Communication System, 4331 processor and 8100 Information System applications.

MODELS

Model 1 001 120 cps maximum bidirectional printer
Note: Actual printer throughput is dependent on system and application characteristics.

Customer Setup: Machine only.

Prerequisites: A Loop Station Connector installed on an IBM Multiuse Communications Loop. See "Loop Accessories" in the 3630 and 8100 machine pages.

Either Character Print - Standard (#1501) or Character Print - Large (#1502) must be specified.

Note: When ordering this machine for attachment to an 8100 system, the appropriate M8130, 8140 or 8101 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

HIGHLIGHTS

The 3645 Printer provides a hard-copy output on a variety of forms to meet plant floor printing requirements. The printer is a bidirectional matrix printer with electronic tabulation and indexing. Line spacing is 6 lines per inch. Up to 4 part cut forms can be used with standard friction feed. For continuous forms, the Forms Tractor (#8700) or the Forms Tractor with Separator Bar (#8701) is recommended. Card stock forms are not recommended.

Two printing feature options are provided:

Character Print - Standard (#1501) provides a basic character size printing (approximately 0.072 inch wide by 0.117 inch high). The printer character dot matrix is four of seven wide by eight high giving high legibility. The maximum print line is 132 positions. Character spacing is ten to the inch.

Character Print - Large (#1502) provides four character size printing options under program control:

Basic character size (approximately 0.072 inch wide by 0.117 inch high), and approximately two times basic size, four times basic size, and eight times basic size.

Intermix of printing sizes on a single line is not permitted.

The 3645 has been designed to operate in most industrial and commercial environments. The 3645 attaches to the 3631 or 3632 Plant Communication Controller via a local 9600 bps loop. The 3645 also attaches to the 3842 or 3843 Loop Control Unit via a 2400 bps loop, 4331 Loop Adapter or 8100 system loop.

Two variable width forms tractors are available. See "Special Features".

Forms Specification: Refer to *Form Design Reference Guide for Printers*, GA24-3488. (Use 3767 specifications.)

Customer Setup: The 3645 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup, and checkout of the 3645 at the time of delivery or when relocating the 3645.
- Removing and packing of the 3645 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3645 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network.

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3645 Printer will normally be performed at the installed location. There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Maintenance courses are offered to the customer for a separate charge.

Physical Environments: The 3645 Printer may be used in industrialized work zones of a wide range of business, industrial, and commercial establishments.

It can resist:

- Concentration of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with shipping, placement, operation, and relocation of the terminal for most types of industries.

For environmental requirements refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning*, GA24-3675.

SPECIAL FEATURES

Character Print - Standard (#1501): Provides dot matrix character size approximately 0.072 inch wide by 0.117 inch high at 10 characters per inch. **Limitations:** Cannot be installed with Character Print - Large (#1502). **Maximum:** One. **Field Installation:** Yes.

Character Print - Large (#1502): Provides four character size printing options under program control: Standard-approximately 0.072 inch wide by 0.117 inch high at 10 characters per inch, and approximately two times standard size, four times standard size, and eight times standard size. Intermix of printing sizes on a single line is not permitted. **Limitations:** Cannot be installed with Character Print - Standard (#1501). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8700 or #8701.

Variable Width Forms Tractor (#8700): A forms feeding device for continuous edge-punched fan-fold forms. Up to 6 parts (total thickness - 0.46mm (0.018 inch) may be used. Five and six part continuous forms should be tried on an individual basis for acceptable feeding, registration, and print quality. Overall forms width from 76mm to 381mm (3 to 15 inches) can be fed. End of forms detection is provided. **Maximum:** One. **Field Installation:** Yes. **Note:** If this feature is ordered by MES, you must specify color #9063 classic blue, #9064 charcoal brown, #9065 pebble gray.

Variable Width Forms Tractor With Separator (#8701): Forms feeding device for continuous edge punched fan-fold forms. A separator bar permits tearing off continuous forms at the perforation to within 40mm (1.5 inches) of the top printing line without misalignment of subsequent forms. Forms should have perforated carrier strips on both sides. Up to 4 part continuous forms total thickness 0.3mm (0.012 inch) may be used. Forms without perforated carrier strips and/or greater than 4 parts are not recommended. Form widths from 127mm to 378mm (5 to 14-7/8 inches) can be used. End of forms detection is provided. **Maximum:** One. **Field Installation:** Yes. **Note:** If this feature is ordered by MES, you must specify color #9063 classic blue, #9064 charcoal brown, #9065 pebble gray.

MODEL CONVERSIONS (None)
ACCESSORIES

Forms Stand (#4450): Permits placement of continuous forms on the stand above floor level and provides for stacking after printing. This accessory is a two-shelf forms stand.

SUPPLIES

None required with machine order. Supplies may be ordered through your DP Supply Function for initial and replacement quantities.

3646 SCANNER CONTROL UNIT

PURPOSE

The 3646 Scanner Control Unit allows attachment of the Magnetic Hand Scanners or the Magnetic Slot Readers for rapid, accurate data collection.

MODELS

The standard 3646 can attach up to two magnetic readers, Magnetic Hand Scanners or Magnetic Slot Readers. Two additional magnetic readers can be attached via the optional Magnetic Reader Attachment (#6351). Each magnetic reader can be addressed for independent operation.

Prerequisites: A Loop Station Connector installed on an IBM Multiuse Communications Loop, see "Accessories" Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader.

Note: When ordering this machine for attachment to an 8100 system, "Terminal Requirements" on the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

The 3646 is a compact terminal designed to bring magnetic scanning capability to the workstation. Its capability includes:

- Free standing on a table, counter, work bench, etc.
- Wall or column mounted via accessory brackets.
- Up to 4 magnetic readers.
- Readers can be Magnetic Hand Scanners or Magnetic Slot Readers in any combination.

Customer Setup: The 3646 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3646 at time of delivery or when relocating the 3646. A Magnetic Hand Scanner or Magnetic Slot Reader is required for checkout.
- Removing and packing of the 3646 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3646 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3646 terminals will normally be performed at the installed location.

For maintenance of 3646 accessories, see "Accessories".

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3646 mdl 1 and accessories may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.

- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning*, GA24-3675.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

(Canada only+)

- Voltage (120V AC, 1-phase, 60 Hz): #9890 for locking plug, or #9891 for non-locking plug.

Note: 120V AC is compatible with existing 115V AC systems. +)

(Except Canada+)

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V - #2804	100V - #2730
220V - #2813	120V - #2802
240V - #2801	

Note 1: 120V AC is compatible with existing 115V AC systems. 240V AC is compatible with existing 235V AC systems.

Note 2: A power cord and plug will be shipped from the plant of manufacture. The 3-digit country code in the DP machine order sheet will be used to select a power cord and plug of the specifications most commonly used in that country. A description of the plug and where-used list is provided in the *IBM 3630 Plant Communication System, Installation Manual- Physical Planning*, GA24-3675.

- Power Plug: If #2802, #2804, or #2730 voltage is specified, then #2714 (non-locking plug) or #2715 (locking plug) must be specified. +)
- Power Cable:
 - 1.83 meter (6 foot) cable - #9986
 - 4.27 meter (14 foot) cable - #9987
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify #9976 for a 1.8 meter (6 foot) cable or #9977 for a 4.3 meter (14 foot) cable.
- Color: Classic blue - #9063 ... charcoal brown - #9064 ... pebble gray - #9065.
- Machine Nomenclature:

English US #2750	Spanish Speaking #2931
Japanese #2930	Portuguese (Brazil) #2933
Canadian French #2935	

SPECIAL FEATURES

Magnetic Reader Attachment (#6351): Allows two additional Magnetic Hand Scanners, Magnetic Slot Readers or Dual Entry magnetic Slot Readers to be attached to the 3646 mdl 1. **Maximum:** One. **Field Installation:** Yes.

Major Revision

3646 Scanner Control Unit (cont'd)

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a *Repair Center Machine Repair Authorization Form #2110*, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a Time and Material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time and materials basis at the Repair Center. "Authorization Form #2110" applies.

Magnetic Hand Scanner: P/N 4123495.

MAGNETIC SLOT READER MAGNETIC SLOT READER, DUAL ENTRY

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Ordering Instructions: See IBM.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

WALL MOUNTING BRACKETS

A two piece mounting bracket is available to mount the 3646 Scanner Control Unit to a wall, column, or other vertical surface.

One piece mounts on the 3646 and the other mounts on the vertical surface. There are four bracket holes on the back of the 3646 and four mounting screws supplied with the brackets. The customer is responsible for supplying the fasteners for the wall bracket.

Ordering Instructions: See IBM.

Warranty: Wall mounting brackets are warranted free from defects of workmanship and materials for 90 days.

Wall Mounting Brackets: P/N 4151768 or feature code #9450.

SUPPLIES (None)

3647 TIME AND ATTENDANCE TERMINAL

PURPOSE

A data entry terminal designed for attendance and other data entry labor reporting applications.

MODELS

Model 1 001

Prerequisites: A loop station connector installed on an IBM Multiuse Communications Loop. For magnetic stripe reading, a Magnetic Slot Reader, Dual Entry Magnetic Slot Reader, or a Magnetic Hand Scanner is required.

When ordering this machine for attachment to a 4331 processor the appropriate M4331 pages should be reviewed.

Customer Setup(CSU): Machine only.

HIGHLIGHTS

The 3647 Time and Attendance Terminal is designed for attendance, labor reporting, and other data entry applications. The base 3647 has a magnetic scanner adapter and a four-digit display that can be used for time of day. Two optional features are available:

- **Function Switch** - A six-position rotary switch that is customer definable.
- **Control Feature** - Provides control signals to allow door openings, audible alarms, etc.

An optional magnetic slot reader mounting bracket accessory (P/N 8632451) provides attachment for a slot reader. This mounting bracket is firmly attached to the 3647 via a keylock. The slot reader cable is coiled within the bracket.

The 3647 can be table- or wall-mounted. An optional wall mounting bracket accessory (P/N 4151768) is available.

The 3647 provides:

- **Time of Day Clock** - The initial time is set under program control and can be set for a 12- or 24-hour clock with time displayed in hours and minutes or hours and hundredths of hours.
- **Input Buffer** - An input buffer mode of operation can be selected to store multiple input messages. This provides a high walk-by rate and allows input when the controller, loop, or data link is inoperative. A no-buffer mode of operation can also be selected to permit interactive processing on each input message.
- **Invalid Document Code** - An invalid document code option can be selected that allows input messages to be checked for the presence of a non-numeric character. Input without this character is rejected by the 3647.
- **Time Stamping** - A time stamping option can be selected that sends the displayed time of day with each input message transmitted to the controller.

Customer Setup: The 3647 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup, and checkout of the 3647 at the time of delivery or when relocating the 3647.
- Removing and packing of the 3647 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3647 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs), prompt retry and recovery actions, and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: The standard maintenance agreement as described in the General Information section applies to the 3647 Time and Attendance Terminal; however, there is no regularly scheduled IBM preventive

maintenance. Maintenance of the 3647 Time and Attendance Terminal will normally be performed at the installed location. If purchased, the terminals are eligible for Maintenance Agreement service immediately following expiration of the warranty period.

Physical Environments: The 3647 Time and Attendance Terminal may be used in industrialized work areas of a wide range of business, industrial, and commercial establishments.

It can resist:

- Concentration of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with the terminal operational sites.
- Vibration and shock associated with shipping, placement, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Installation Manual - Physical Planning*, GA24-3675.

On-Site Testing Allowance: The 3647 Time and Attendance Terminal will be eligible designated units when the 3630, 4331 Loop Adaptor or 8100 controller to which they are attached qualifies for an on-site testing allowance.

Systems Engineering Services: Systems Engineering Services are available upon customer request and at a charge to assist the customer in the use of the 3647.

Ordering Instructions: See IBM

Magnetic Slot Reader Mounting Bracket: P/N 8632451.

SUPPLIES

None required with machine order. Supplies may be ordered through IBM for initial and replacement quantities. For further information consult your DP Supplies Coordinator.

3651 STORE CONTROLLER MODELS 25, 75

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The control unit for a 3650 Programmable Store System. Using standard retail functions tailored by the customer to his own requirements, and/or customer-supplied supermarket application programming, the 3651 controls the operation of the 3650 Programmable Store System and its related terminals and provides for communications with an appropriate S/370, 30XX, or 4300 virtual storage processor.

MODELS 25, 75

Model B25: 9.2 megabyte integral disk storage. Limited features and processing capability. Supported by Programmable Store System Host Support only. Attaches 3275 model 3, 3653 model 1 and 1P, 3683 (all models), and 3663 model 1P, 2 and 3P terminals.

(Canada only) **Model C25:** Same as model B25 except has 18.4 megabyte integral disk storage. The model C25 is physically larger than the B25.<)

Model A75: 5 megabyte integral disk storage. Many features, full processing capability. Supported by Programmable Store System Host Support only. Attaches 3275 model 3, 3653 model 1 and 1P, 3683 all models, 3657 model 1, and 3663 model 1P, 2 and 3P terminals.

Model B75: Same as model A75 except has 9.3 megabyte integral disk storage.

Model C75: Same as model A75 except has 18.6 megabyte integral disk storage. The model C75 is physically larger than the model A75 and B75.

Model D75: Same as model A75 except has 27.9 megabyte integral disk storage. The model D75 is the same physical size as the model C75.

Note: The 3651 model B25 (Canada only) and C25 (<) Store Controller provide a lower entry system for those users who do not require the internal processing capability of the 3651 model A75, B75, C75 and D75. The effect of the different internal processing capability upon overall system performance is dependent upon the total system configuration and workload. To establish a supportable system configuration for any model Store Controller, systems design must be performed using the performance models and configuration aids available from IBM.

HIGHLIGHTS

The 3651 is a modular, programmable unit that provides the link between its attached terminals and the host data processing center. The 3651 is normally used to collect data from the various parts of the system, perform edit, logic, and arithmetic operations on that data and then log and/or forward it to its ultimate destination within the overall system - terminal or data processing center. The 3651 mdl 75 can also communicate with another mdl 75. Application functions for retail operations via 3653 mdl 1 terminals or 3653 mdl 1P terminals, when functioning as 3653 mdl 1 terminals are provided as standard. All other applications are performed by customer-supplied application programming. In mdls B25, (Canada only) C25, A75, B75, C75 and D75, customer-supplied supermarket and/or retail application programs may be used along with, or instead of, the standard retail operations. Standard features include the following:

- Loop Adapter

Mdl 25: Provides for attachment of one in-store local loop.

Mdl 75: Provides for attachment of one in-store local loop and one additional loop which may be specified as local or remote (see Figure 1).

Controller Storage

The basic 3651 contains storage optionally expandable via special features (see "Special Features"). System configuration as well as user programs determine if additional storage increments are required.

All Models

Basic Storage: 61,440 bytes
 Maximum Storage: 126,976 bytes

Integral Disk Storage

The Integral Disk Storage is used for storage of selected controller functions, user-written application programs, system configuration data, data logging and data sets (files).

Host Communications Adapter: Mdl 75 (Canada only) and Mdl 25 with External Modem Interface (#9150) (<) Provides for transmission to and from a properly equipped S/370, 30XX, or 4300 processor. The basic transmission rate is 2400 bps over switched or non-switched networks with 4800 bps as a specify option. Also provides for communications with 8100 processors over nonswitched lines using SDLC. This adapter interfaces to appropriate IBM modems or to the local Attachment Interface of the 4331 processor or to the Direct Connection interface of 8100 processors. With the appropriate features available on mdl 75, only the Host Communications Adapter can communicate with another 3650 Programmable Store System or locally attach a 3704, 3705, 3720 or 3725. (Canada only) (Mdl 25 with 1200 bps Integrated Modem #9512 provides for transmission to and from a properly equipped S/370, 30XX, or 4300 processor. The basic transmission rate is 1200 bps over switched network using an IBM integrated modem.<) See "Communications Facilities" below and M2700 pages.

To communicate with another 3650 system or local attachment to a 3704, 3705, 3720 or 3725 see "Special Features" below.

Audible Alarm: Activated when predetermined events require operator attention or intervention for system operation. A contact closure to which the customer can attach his remote alarm is available as an option with 3669/3689 Attachment. (See "3669/3689 Attachment" in "Special Features" below)

Controller Storage Save: (Mdl 75 only) Critical areas of controller storage are automatically written on the integral disk unit when power is turned off or a power failure is detected.

Terminal Device: The terminals which are identified above under the different mdls of the 3651 are attached to the 3651 via Local/Remote Loop Adapter. Only the 3683 terminal, all mdls, will attach to 4800 bps Local Loop Adapter. Remote Loop Adapter available at 2400 bps only. A maximum of 191 terminals can be addressed by the 3651. However, the number of terminals which can be supported depends upon traffic volumes, desired response times, applications to be performed, and the mdl of the 3651.

One 3784 Line Printer mdl 1 may be attached to the 3651 Control Unit mdl 75.

Communications Facilities: The Host Communications Adapter (mdls 25 and 75), Auxiliary Communications Adapter (available on mdl 75 only) and 3669/3689 attachment (available on mdl 75 only) permit operation at the speeds indicated, over the facilities shown below, when using the appropriate DCE. For information concerning the facilities, see M2700 pages.

- At 1200 bps - on facility CA2 (switched - Canada only)
- At 1200 bps - on the public switched telephone network or a nonswitched voice grade line.
- At 2400 or 4800 bps - on the public switched telephone network, a nonswitched voice grade line, a public switched data network or a public nonswitched data network.

Prerequisites: At the host location, a virtual storage S/370, 30XX, or 4300 processor with properly equipped 3704, 3705, 3725 or communications adapter. See M2700, 3704, 3705, and 3725 pages.

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
235V #2814	230V #9904

(Japan only) > For 100V 50/60 Hz, see RPQ 780210 for ordering instructions, prerequisites and limitations. <)

- Machine Nomenclature:

Canadian Eng #2934	Japanese #2930

French #2928	UK English #2927
German #2929	US English #2750
Italian #2932	

- Line Facilities: Modem Attachment, Host Communications Adapter - one modem can be attached to this adapter on the 3651. The 3651 provides a cable and interface for connection of modems at transmission rates of 1200, 2400 and 4800 bps for communication with the S/370, 30XX, or 4300 processor. If switched network is selected, auto answer capability is standard. If a non-mandatory modem is used, specify code #9770 Wrap Cable is available to facilitate problem determination. The modem must provide the clocking, a CCITT V.24/V.28 or RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less on the Host Communications Adapter and the Auxiliary Communications Adapter.

Service (bps)	Specify Code
1200	#2821
2400	#2826
4800	#2827

- (Canada only) > Modem Attachment Host Communications Adapter: One IBM modem can be attached to this adapter on

the 3651. The 3651 (except mdl 25) provides a cable and interface for connection of IBM modems at transmission rates of 2400 or 4800 bps for communications with the S/370, 30XX, 4300 processor or 8100 System. Can also be attached without modem to the local Attachment Interface (#4801) of a 4331 processor, mdl group 1 or 2. Can also be attached without modem at 4800 bps to the Direct Connection interface (SDLC FAC 16) of an 8101, 8130, or 8140 processor. The 3651 mdl 25 is featured to provide either a switched 1200 bps integrated modem (#9512) or an external modem interface (#9150) for connection of IBM modems at transmission rates of 2400 or 4800 bps for communications with the S/370, 30XX, 4300 processor or 8100 System. If switched network is selected, auto answer capability is standard. If leased operation is selected, dial backup is provided on a manual dial basis using the 3863, 3864, 3872 or 3874 Modem with appropriate special features. 4-wire Switched Network Backup is available with the 3863 mdl 1 and 3864 mdl 1.

- External Modem Interface (#9150): (Mdl 25) Provides a cable and interface on the Host Communications Adapter for connection of an IBM modem at transmission rates of 2400 or 4800 bps for communications over switched or leased networks. If switched network is selected auto answer capability is standard. Limitations: Not available with 1200 bps Integrated Modem (#9512). Maximum: One. Field Installation: Yes. Prerequisites: A 3863, 3864, 3872 or 3874 modem.
- If a non-IBM modem is used, Specify Code #9770 Wrap Cable is available to facilitate problem determination. The non-IBM modem must provide the clocking, an RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less on the Host Communications Adapter and the Auxiliary Communications Adapter.

Service (bps) Specify Code

2400	#9120
4800	#9126

Notes:

- For communications capabilities product description and special features, see M2700, 3863, 3864, and 3872 pages.
 - Specify codes #9120 and #9126 are not applicable with 1200 bps Integrated Modem (#9512).
- 1200 bps Integrated Modem (#9512): (Mdl 25) Provides an integrated modem for operation over switched communication facilities at 1200 bps. Auto answer is provided. The cable provided is compatible with the IBM Protective Coupler (CBS type) available as P/N 1649100 (see RPQ 8Q0130 for description). For Canada, an additional cable is provided for attachment to the Canadian protective coupler. Limitations: Not available with External Modem Interface (#9150). Field Installation: Yes. Maximum: One. Prerequisites: An FCC-registered protective device (DAA) of the CBS type is to be provided by the user. <)
 - Modem Attachments:
 - For Host Communications Adapter (specify one):
 - 3976 mdl 3. PTT-mandatory modems at 1200 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2982. Prerequisite: #2858.
 - 3863 or 3872. PTT-mandatory modems at 2400 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.26 or V.26bis, and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2891, #2897.

- (Canada only > Facility K3M (mdl 25 only). Specify: #2897. Prerequisite: #9150.
 - Facility K3M (mdl 75 only). Specify: #2897. <)
 - 3864. PTT-mandatory modems at 4800 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.27 or V.27bis or V.27ter, and ISO Standard 2110, or PTT-mandatory modems at speeds up to 4800 bps on nonswitched limited distance (base-band) lines complying with CCITT Recommendations (1976) V.24, V.28 and ISO Standard 2110. Refer to M2700 pages. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2954.
 - TCTS Dataroute Network in Canada at 2400 or 4800 bps (mdl 25). Specify: #2846. Prerequisites: #9150.
 - CN/CPT Infodat Network in Canada at 2400 or 4800 bps (mdl 25). Specify: #2846. Prerequisites: #9150.
 - TCTS Dataroute Network in Canada at 2400 or 4800 bps (mdl 75). Specify: #2846.
 - CN/CPT Infodat Network in Canada at 2400 or 4800 bps (mdl 75). Specify: #2846.
 - NTT DDC Network in Japan at 2400 or 4800 bps. Specify: #2846.
 - NTT DDX Network in Japan at 2400 or 4800 bps.
 - 3704/3705/3725 Direct Attach at 2400 bps (3651 mdl 75 only). Specify: #2863.
 - In Japan to satisfy the NTT's DTE Self Test requirements when attaching a non-IBM modem. Specify: #2946.
 - Transdata Network in Brazil at 2400/4800 bps non-switched service.
 - 3669 mdl 1 or 3689 mdl 1 for 3650 backup or host communication on Canadian Public Switched Telephone Network. Specify: #9200. Prerequisites: #8069.
- Note: Maximum one 3669 per 3651. Aux. Comm. Adapter (#6185, #2703, #2704) not allowed.
2. For Aux. Comm. Adapter Feature (#6185, #2703, #2704): These features not allowed if feature #8069 and specify #9200 (3669 Attachment on Host Comm. Adapter) are present. Only one of the Aux. Comm. Adapters (#6185, #2703 or #2704) allowed per 3651 mdl 75.
- For 3650 Backup:
 - ▲ 3669 mdl 3. Specify: #9210.
 - ▲ 3669 mdl 1 or 3689 mdl 1 for 3650 backup on Canadian Public Switched Telephone Network.
 - For 3651 to 3651 Operation:
 - ▲ 3976 mdl 3. PTT-mandatory modems at 1200 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2721. Prerequisites: #2703.
 - ▲ 3863, 3864, 3872, or 3874. Specify: #2727. Prerequisites: #6185.
- ▲ TCTS Data Route Network in Canada (2400 bps). Specify: #2726. Prerequisites: #6185.
 - ▲ PTT-mandatory modems at 2400 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.26 or V.26bis and ISO Standard 2110, or PTT-mandatory modems at 2400 bps on nonswitched limited distance (base-band) lines complying with CCITT Recommendations (1976) V.24, V.28 and ISO 2110. Refer to M2700 pages. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin.
 - ▲ In Japan, to satisfy the NTT's DTE self-test requirements when attaching a non-IBM modem. Specify: #2946. Prerequisites: #6185.
 - ▲ Transdata Network in Brazil at 2400/4800 bps nonswitched service.
 - ▲ Facility K3M in Canada. Specify: #2725. Prerequisites: #6185.
- For Remote Loop Communications: Specify one for each Remote Loop Adapter (#9552 or #6111).
- ▲ 3872 mdl 1 for Multipoint Remote Loops. Specify: #2892.
 - ▲ 3872 mdl 1 with #6101 for Serial Remote Loops. Specify: #2892.
 - ▲ PTT-mandatory modems at 2400 bps on non-switched lines complying with CCITT Recommendations (1976) V.24, V.26, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2867.
- Controller Designation: Specify #9491 on the first 3651 mdl 25 or 75 to be used with a host system location requiring 3650 Programmable Store System Host Support. Specify #9492 on each additional 3651 mdl 25 or 75 in the network. Specification of #9491 will provide IBM control code for the controller and all its attached devices (except the 3683 terminal) via a DTR sent to the designated host location.
- In addition, if #9491 is specified, also specify #9493 if any 3683 terminals are attached to the 3651 controller and if a 3680 system is not attached to the same host system as the 3651. Specification of #9493 will provide 3683 control code. (If a 3680 system is attached to the same host system, the 3683 control code is provided by a specify code on the 3684.) When #9491 is specified, additional information must be specified as follows:
1. Specify one of the following to indicate magnetic tape density (media) used at the host system location. The tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.
 - #9412: 9-track 800 bpi
 - #9413: 9-track 1600 bpi
 - #9414: 9-track 6250 bpi
- The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.
2. Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:
 - Line 1 - IBM Programming Systems Rep.
 - Line 2 - c/o (Name of Customer)
 - Line 3 - Street Address (or P.O. Box)
 - Line 4 - City, Country, Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code #9491). Whenever controller data is updated by an EC, the EC will be shipped to the most current Microcode Control (MC) address.

In addition, if #9493 is specified with #9491, specify #9490 if there is a storage requirement that prevents 3683 operation with the current level of 3683 control code (i.e., EC 320560 or later). #9490 provides 3683 control code level EC 320503 which operates in the same control code storage allocation as is required for 3683 control code level EC 320502. It is strongly recommended that new 3683 customers and 3687 customers do not take this specify option.

- Specify the following: #9504 - for 3650 BSC or SDLC Programmable Store Systems host support under DOS/VS VTAM or BTAM, OS/VS1 VTAM or BTAM, and OS/VS2 VTAM or BTAM.

Note: The corresponding release of 3650 PSS Host Support must be ordered from IBM. See SCP pages.

- Store Loop Polarity Tester: One is furnished at each site at no charge. See "Accessories" for additional Store Loop Polarity Testers.

Notes:

- Tester matches receptacle ("Female Loop Connector"), P/N 5162880. See "Accessories".
 - The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)
 - Second Loop Adapter (mdl 75 only): Specify #9442 to designate the second loop adapter as local or specify #9552 to designate the second loop adapter as remote. Do not use these specify features if ordering 4800 bps local loop adapter for loop positions 1 and 2 (#4895). See Figure 1 below.
- Note:** Specify #9552 not allowed with 3669/3689 Attachment (#8069).
- RFI Standard: The RFI Standard (Specify #2759) is now provided on all machines as standard.

SPECIAL FEATURES

Control Storage Features: The amount to be ordered is dependent upon the number and type of terminals attached to the system as well as system configuration and user programs. For available storage configurations, see Table A below.

Storage Increment - Type II (#1564): Each #1564 provides the 3651 with an additional 16,384 positions of storage. Maximum: Three (see Table A). Field Installation: Yes. Prerequisites: The 3651 must be equipped with Storage Expansion Feature (#1570) and First Storage Increment (#1571).

Table A

Storage Configuration		Feature Distribution		
Total Storage	Storage Expansion (#1570)	First Storage Increment (#1571)	Storage Increment Type II (#1564)	
(A) 61440	0	0	0	
(B) 77824	1	1	0	
(C) 94208	1	1	1	
(D) 110592	1	1	2	
(E) 126976	1	1	3	

Storage Expansion Feature (#1570): Provides the capability of expanding storage beyond 61,440 bytes. Maximum: One. Field Installation: Yes. Note: First Storage Increment (#1571) or First Storage Increment (#1571) and Storage Increment - Type II (#1564) are required to provide the appropriate additional positions of storage (see Table A).

First Storage Increment (#1571): Provides the 3651 with the first 16,384 additional positions of storage. See Table A. Maximum: One. Field Installation: Yes. Prerequisites: #1570.

Aux Comm Adapter Synchronous Clock and CCITT Interface (#2703): (Mdl's A75, B75, C75, D75) Provides a separate 600/1200 bps communications interface which can operate independently of the Host Communications Adapter and communicate via a 3976 mdl 3 or mandatory PTT (or equivalent) modems to another 3651 mdl 75 with the same feature. Limitations: Only one Auxiliary Communications Adapter (#2703, #2704, #6185) allowed per 3651 mdl 75, not allowed with 3669/3689 Attachment #8069. Maximum: One. Field Installation: Yes. Prerequisites: A 3976 mdl 3 or a mandatory 600/1200 bps PTT modem (and in some countries RPQ 7B0212) and appropriate specify code plus another 3651 mdl 75 similarly equipped.

Auxiliary Communications Adapter Direct Attach (#2704): (Mdl's A75, B75, C75, D75) Provides a 2400 bps communications interface which operates independently from the Host Communications Adapter to allow direct communications with another 3651 mdl 75 with the same feature without the use of modems. Limitations: Only one Auxiliary Communications Adapter (#2703 or #2704 or #6185) allowed per 3651 mdl 75, not allowed with 3669/3689 attachment (#8069). Maximum: One. Field Installation: Yes. Prerequisites: Another 3651 mdl 75 with (#2704).

Synchronous Clock and CCITT Interface (#2858): (Canada only) (> (Not C25) <) This feature provides interface for the host communication adapter for attachment of the 3976 Modem mdl 3 or a supported PTT-mandatory modem at 1200/600 bps. See the M2700 pages, facility C2 or D5, for details. Operation at 600 or 1200 bps is selectable. Limitations: Not allowed with 3669/3689 Attachment (#8069) with specify #9200. Maximum: One. In Japan, #2946 must be specified to satisfy the NTT's DTE Self-Test requirements when attaching a non-IBM modem. Note: Required with specify code #2982.

Direct Attachment 3704/3705 (#2863): (Mdl's A75, B75, C75, D75) Provides clocking from the Host Communications Adapter allowing the direct attachment to a local 3704 or 3705 at 2400 bps. Limitations: Not allowed with 3669/3689 attachment (#8069) with specify #9200. Maximum: One. Field Installation: Yes. Prerequisites: The 3704 or 3705 must be equipped with Line Set, Type 1F (#4716). Note: A 6m (20 ft) external cable is provided which connects to the 3704/3705 cable.

IML-Write Adapter (#4633): Provides the 3651 with the ability to write an IML (Initial Machine Load) tape on a user provided tape cassette recorder to be read by a Point-of-Sale terminal equipped with the appropriate IML-Read Adapter (#4632 or #4633) feature. (Refer to "IBM 3650 Programmable Store System Introduction Manual", GA27-3163, for cassette recorder interface requirement.) Maximum: One. Field Installation: Yes.

Local Loop Adapter, Add'l (#4882): (Mdl's A75, B75, C75, D75) Provides an additional Local Loop Adapter as the Third Loop on the 3651. The actual number of terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the loops as well as the communications link to the S/370. See "Terminal Devices" above. Specify: See Figure 1. Limitations: Not available on the 3651 if 9600 bps Loop Adapter (#4890), 4800 bps Loop Adapter (#4900) or Remote Loop Adapter (#6111) is installed. Maximum: One. Field Installation: Yes.

9600 bps Loop Adapter (#4890): (Mdl's A75, B75, C75, D75) Provides a 9600 bps local Loop Adapter as the Third Loop. The feature provides for the attachment of 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) feature installed. The actual number of 3275 Display Station mdl 3s installed will depend upon program capacity and time requirements of the 3651 to service the Loops and

the communications link to the S/370. See "Terminal Devices" above. Limitations: Not available if Local Loop Adapter, Add'l (#4882), 4800 bps Loop Adapter (#4900) or Remote Loop Adapter (#6111) is installed. Only 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) can be attached to this Loop adapter. Specify: See Figure 1. Maximum: One. Field Installation: Yes.

4800 bps Loop Adapters (#4895): (Mdl's A75, B75, C75, D75) Provides 4800 bps Loop Adapters in Loop Adapter positions 1 and 2. The actual number of 3683 terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the loops as well as the communication link to the S/370. See "Terminal Devices" above. Limitations: Not allowed with additional 2400 bps Local Loop Adapter (#9442) or 2400 bps Remote Loop Adapter (#9552). Specify: See Figure 1. Maximum: One. Field Installation: Yes.

4800 bps Loop Adapter (#4900): (Mdl's A75, B75, C75, D75) Provides a 4800 bps local loop adapter as the third loop adapter on the 3651. The actual number of 3683 terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the loops as well as the communications link to the S/370. See "Terminal Devices" above. Specify: See Figure 1. Limitations: Not available on the 3651 if 2400 bps Local Loop Adapter (#4882) or 9600 bps Local Loop Adapter (#4890) or 2400 bps Remote Loop Adapter (#6111) is installed. Maximum: One. Field Installation: Yes.

Remote Loop Adapter (#6111): (Mdl's A75, B75, C75, D75) Provides a Remote Loop Adapter as the third loop on the 3651 for online service for up to 12 remote sites per Remote Loop Adapter. The feature provides an interface to a 3872 Modem on site which via leased line connects to a 3659 Remote Communications Unit at each remote site. This allows for the extension of the Loop to up to (1) three remote locations, with a 3659 mdl 1 at each site, (2) 12 remote locations, with a 3659 mdl 2 (multipoint) at each site, (see "Terminal Devices" above). The 3651 treats the remote Loop as if it were a local Loop. Specify: See Figure 1. Limitations: Not available if Local Loop Adapter, Add'l (#4882), 9600 bps Loop Adapter (#4890) or 4800 bps Loop Adapter (#4900) is installed. Maximum: One. Field Installation: Yes. Prerequisites: One 3872 with #6101 or #6102 per Remote Loop Adapter at 3651 site and a 3659 Remote Communications Unit at each remote site. When more than one remote site is attached using 3659 mdl 1, a half-duplex 2-wire terminated, non-switched voice grade line is required between the 3651 and the first remote site between successive remote sites, and from the last remote site back to the 4-wire terminated nonswitched voice grade line is required. When using the 3659 mdl 2 for more than one remote site, 4-wire duplex multipoint service is required. The 3659 mdl 2 requires that the 3872 be a basic control station (no special features) or equipped with #6302. Note: The 3872 or equivalent PTT listed modem may be used.

Auxiliary Communications Adapter (#6185): (Mdl's A75, B75, C75, D75) Provides a separate 2400 bps or 4800 bps communications interface which can operate independently of the Host Communications Adapter. It can be used for either one of the following but not both: (1) 3651 mdl 75 to mdl 75 communications, or (2) Communications with another 3650 system via a 3669 Store Communications Unit at 2400 bps(Canada only) or a 3689 Store Communications Unit at 4800 bps(<). Limitations: Only one Auxiliary Communications Adapter (#2703 or #2704 or #6185) allowed per 3651 mdl 75, not allowed with 3669/3689 Attachment (#8069) with specify #9200 for Host Communications Adapter. The 4800 bps Auxiliary Communications Adapter cannot operate concurrently with 4800 bps Host Communications Adapter and the three 4800 bps Loop Adapters (#4895 and #4900). Only four of the five may operate concurrently at greater than 2400 bps. Maximum: One. Field Installation: Yes. Prerequisites: (1) For 3651 mdl 75 to mdl 75 communications: A 3863, 3864, 3872, or 3874, or a mandatory PTT 2400 bps or 4800 bps modem (and, in some countries, RPQ 7B0212) and appropriate specify code, plus another 3651 mdl 75 similarly equipped. (2) For backup with another 3650 system: #8069 with #9210, or a 3669 Store Communications Unit at 2400 bps(Canada only) or a 3689 Store Communications Unit at 4800 bps(<).

3669/3689 Attachment (#8069): (Mdl's A75, B75, C75, D75) Provides the capability to attach one 3669 Store Communications Unit, which

allows communications over switched networks at 2400 bps(Canada only> or one 3689 Store Communications Unit, which allows communications over switched networks at 4800 bps(<)) with another 3650 system, and alternately with a S/370 host processor. This feature can be provided for use with either the Host Communications Adapter or the Auxiliary Communications Adapter (#6185), but not with both. If the Auxiliary Communications Adapter is present, however, then this feature must be installed for use with the Auxiliary Communications Adapter. Limitations: When used with Auxiliary Communications Adapter, (#6185), it cannot communicate with a host processor. #9210 not allowed with Auxiliary Communications Adapter Synchronous Clock and CCITT Interface (#2703) or Auxiliary Communications Adapter Direct Attachment (#2704). #9200 not allowed with Direct Attachment 3704/3705 (#2863) or Synchronous Clock and CCITT Interface (#2858). Specify: (1) #9200, for use with Host Communications Adapter, #9210 for use with Auxiliary Communications Adapter #6185. (2) #9220 if local audible alarm is desired, #9230 if contact closure is desired when operator attention is required. Maximum: One. Field Installation: Yes. Prerequisites: (1) Local Loop Adapter, specify #9442 for 2400 bps; or 4800 bps Local Loop Adapter, specify #4895. (2) 3669 (Canada only> or 3689(<)) Store Communications Unit. (3) Auxiliary Communications Adapter (#6185) if #9210 is specified. (Except Canada> Note: FC8069 (3669/3689 Attachment) is compatible with the 3669 mdl 3 with RPQ ZB7983 4800 bps operation.<)

3784 Adapter (#8154): (Mdl's A75, B75, C75, D75) Provides the capability to directly attach one 3784 Line Printer mdl 1 to the 3651 controller. Fixed length cables are supplied as standard. Refer to "3650 PSS Installation Manual -- Physical Planning", GA27-3167. Maximum: One. Field Installation: Yes. Prerequisites: Specify #9716 on the 3784 mdl 1 for attachment of the 3784 to the 3651 mdl A75 and B75 and #9717 for attachment to the 3651 mdl C75 or D75.

Figure 1

Loop Adapter Position	Loop *Adapter	Special Feature	Specify Code
1	Local	2400 bps	Standard
1 & 2	Local	4800 bps	#4895
2	Add'l		
	Local	2400 bps	#9442
	Remote	2400 bps	#9552
3	Add'l		
	Local	2400 bps	#4882
	Add'l		
	Local	4800 bps	#4900
		9600 bps	#4890
	Remote	2400 bps	#6111

Unless the 4800 bps Local Loop Adapter feature (#4895) is ordered for positions 1 and 2, Loop Adapter Position 1 is occupied by the standard Local Loop Adapter (2400 bps) and Loop Adapter Position 2 is also standard and must be specified as 2400 bps local (#9442) or 2400 bps remote (#9552). If loop adapter position 2 is specified as remote, see Remote Loop Adapter (#6111) for prerequisites which will apply. For Loop Adapter Position 3, either a 2400 bps Add'l Local (#4882) or a 4800 bps Add'l Local (#4900) or 2400 bps Remote (#6111) or 9600 bps Local (#4890) Loop Adapter may be ordered. Limitations: Host communications, Auxiliary Communications, and Loop Adapters 1-3 cannot operate at 4800 bps or greater simultaneously. One adapter must be 2400 bps or less to allow all communications to operate simultaneously.

MODEL CONVERSIONS

The following model changes can be made in the field:

From	To	A75	B75	C75	D75
A50	X		X*		
A60	X		X*		

A75	X*
B25	X*
B50	X
B60	X
(Canada only>	
C25	X* X*<)
C75	X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

(Canada only> On purchased model 25 to model 75 changes, External Modem Interface (#9150) is a prerequisite on the model 25. <)

On purchased model 50 to model 75 changes, either Local Loop Adapter, Add'l (#4882 with #9442 or #9443) or Remote Loop Adapter (#6111 with #9552 or #9553) is a prerequisite on the mdl 50.

ACCESSORIES

Cables: IBM shielded twisted-pair cable (or equivalent) or bulk indoor loop cable is required for attachment of 3650 units. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

- Twisted-pair cable - For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation within your country.

Bulk Indoor Loop Cable (P/N 5165886): Bulk Indoor Loop Cable to attach 3650 units may be purchased from IBM or a customer-selected source. See "Physical Planning Manual", GA27-3074, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM.

Cables P/N 7838695: This Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b.) Maximum allowable cable temperature range is -34 degrees C to +105 degrees C. This Bulk Indoor Loop Cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). Warranty: Loop Cable is warranted free from defects of workmanship and materials for 90 days.

Loop Accessories

Female Loop Connector (P/N 5162880): The Female Loop Connectors will be used in all positions of the 3650 Store Loops where terminals will potentially be installed. The corresponding male connector will either be the plug provided on each terminal or, in the case of the loop position currently not occupied by a terminal, the Loop Shorting Plug (see below).

Loop Shorting Plug (P/N 1860198): The Loop Shorting Plug will be used in all 3650 Store Loop positions that are not occupied by terminals. See "3650 Physical Planning Manual", GA27-3074, for details.

Store Loop Polarity Tester: Order via MES or PSR from Vimercate.

SUPPLIES

Contact IBM.

3651 STORE CONTROLLER MDLS A50, B50

(NO LONGER AVAILABLE)

PURPOSE

Through its standard functions, tailored by the customer to his own requirements, the 3651 controls the operation of the 3650 Retail Store System and its related terminals and provides for communication with an appropriate S/370, 30XX, or 4300 virtual storage processor.

MODELS A50, B50

Model A50: 5 megabytes of integral disk storage

Model B50: 9.3 megabytes of integral disk storage

HIGHLIGHTS

The 3651 is a modular, programmable unit that provides the link between point-of-sale (3653), receiving-marking (3275 mdl 3 and 3657), management (via 3275 mdl 3), and the host data processing center. The 3651 collects data from the various parts of the retail system, performs edit, logic, and arithmetic operations on that data and then logs and/or forwards it to its ultimate destination within the overall system-terminal or data processing center. The 3651 also communicates with its attached terminals on an interactive basis and processes inquiries against its files. Standard features include the following:

- **Local Loop Adapter:** Provides for the attachment of one in-store loop.
- **Controller Storage:** The basic 3651 contains storage optionally expandable via special features to 106,496 bytes (see "Special Features"). System configuration as well as user programs determine if additional storage increments are required. Operation with many user programs will require the additional storage increments.
- **Integral Disk Storage:** The Integral Disk Storage is used for storage of selected controller functions, user written application programs, system configuration data, data logging and data sets (files).

	Mdl A50 (5MB)	Mdl B50 (9.3MB)
Bytes per Track	15,360	15,360
Tracks per Cylinder	2	2
Bytes per Cylinder	30,720	30,720
Cylinders per IDS	167	301
Storage Capacity		
Movable Head	5,130,240	9,246,720
Fixed Head	122,880	122,880

Host Communications Adapter: Provides for transmission to and from a properly equipped S/370, 30XX, or 4300 Processor. The basic transmission rate is 2400 bps over nonswitched or switched networks with 4800 bps as a specify option. This adapter interfaces to appropriate IBM modems (see "Communication Facilities" below and M2700 pages). For local attachment to 3704/3705 or communications adapter on a 4321/4331 processor, see "Special Features".

Audible Alarm: Is activated when predetermined events require operator attention or intervention for system operation.

Controller Storage Save: Critical areas of controller storage are automatically written on two areas of the integral disk unit when power is turned off or a power failure is detected.

Terminal Devices: The following terminals are attached to the 3651 Store Controller via Local/Remote Loop Adapter: 3653 Point of Sale Terminal, 3275 mdl 3 Display Station, and the 3657 Ticket Unit. Local Loop adapter number one can address 63 terminals and the other two Loop adapters (local or remote) can each address 64 terminals. However, the number of terminals which can be supported on each Loop depends upon traffic volumes, desired response times, and applications to be performed.

One 3784 Line Printer mdl 1 may be attached to the 3651 controller unit.

To establish a supportable systems configuration, systems design should be performed using the performance models and configuration aids available from IBM.

Communication Facilities: The communications adapter permits operation at the speeds indicated, over the facilities shown below, when using the appropriate modem. For information concerning the facilities, see M2700 pages. The alphanumeric communication facility references below correspond to those shown on the charts on those pages.

- At 1200 bps: PSTN or NSVGL
- At 2400 bps: PSTN, NSVGL, PSDN or PNSDN
- At 4800 bps: NSVGL, PSDN or PNSDN

PSTN = the public switched telephone network

NSVGL = a nonswitched voice grade line

PSDN = a public switched data network

PNSDN = a public nonswitched data network

Prerequisites: A 3704 or 3705 in 2701, 2703 Emulation Mode for BSC systems and in NCP/VS mode for SDLC systems (with appropriate features; see M3704 and 3705 pages) attached to any virtual storage S/370 or 4300 processor (except 3115). Also attaches via a Communications Adapter feature on the 4321 or 4331 processor. See M4321 or 4331 pages for details. Communications at 1200 bps require Synchronous Clock and CCITT Interface (#2858).

German #2929	US English #2750
Italian #2932	

- **Modem Attachment Host Communications Adapter:** One IBM modem can be attached to this adapter on the 3651. The 3651 provides a cable and interface for connections of IBM modems at transmission rates of 1200, 2400 or 4800 bps for communications with the S/370, 30XX, or 4300 processor. Attachment can also be without modem to the local Attachment Interface (#4801) of a 4331 processor. If switched network is selected, auto answer capability is standard. If a non-IBM modem is

used, Specify Code #9770 Wrap Cable is available to facilitate problem determination. The non-IBM modem must provide the clocking, an RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less.

Specify
Code

Speed (bps) Facility (1)

#2821	1200	PSTN
#2822	2400	PSTN
#2823	1200 (2)	NSVGL
#2824	1200 (3)	NSVGL
#2825	2400 (2)	NSVGL or PNSDN
#2826	2400 (3)	NSVGL or PNSDN
#2827	4800 (2)	NSVGL or PNSDN
#2828	4800 (3)	NSVGL or PNSDN

PSTN = the public switched telephone network

NSVGL = a nonswitched voice grade line

PNSDN = a public nonswitched data network

Notes:

1. For communications capabilities, product description and special features, see M2700, 3863, 3864, and 3872 pages.
2. Point-to-point network.
3. Multipoint network.

If a non-mandatory modem is used, Specify Code #9770 Wrap Cable is available to facilitate problem determination. The modem must provide the clocking, a CCITT V.24/V.28 or RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less.

● Modem Attachments:

1. For Host Communications Adapter (specify one):

- PTT-mandatory modems at 1200 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin.
- 3872 Modem. Specify: #2891.
- Facility K3M in Canada. Specify: #2897.
- PTT-mandatory modems at 2400 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.26 or V.26bis, and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2897.
- PTT-mandatory modems at 4800 bps on switched or nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.27 or V.27bis or V.27ter, and ISO Standard 2110, or PTT-mandatory modems at speeds up to 4800 bps on nonswitched limited distance (base-band) lines complying with CCITT Recommendations (1976) V.24, V.28 and ISO Standard 2110. Refer to M2700 pages. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Specify: #2846.
- TCTS Dataroute Network, Canada at 2400 or 4800 bps.
- CN/CPT Infodat Network, Canada at 2400 or 4800 bps.
- NTT DDC Network, Japan at 2400 or 4800 bps.
- NTT DDX Network, Japan, at 2400 or 4800 bps.
- 3704/3705 direct attach at 2400 bps. Specify: #2863.

- In Japan, to satisfy the NTT's DTE self test requirements when attaching a non-IBM modem. Specify: #2946.

- Transdata Network in Brazil at 2400/4800 bps non-switched service.

2. Remote Loop Communications (specify one for each Remote Loop Adapter, #6111):

- 3872 mdl 1 with Point-to-point (#6101). Specify: #2892.
- PTT-mandatory modems at 2400 bps on non-switched lines complying with CCITT Recommendations (1976) V.24, V.26, V.28 ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin.

- Controller Designation: Specify #9491 on first 3651 to be used with a host system location requiring RSS/Host support and #9492 on each additional 3651 in the network.

When #9491 is specified, additional information must be specified as follows:

1. Specify one of the following to indicate magnetic tape density (media) used at the host system location. The tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

- #9412 -- 9-track 800 bpi
- #9413 -- 9-track 1600 bpi
- #9414 -- 9-track 6250 bpi

The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

2. Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

- Line 1 -- IBM Programming Systems Rep
- Line 2 -- c/o (Name of Customer)
- Line 3 -- Street Address (or P.O. Box)
- Line 4 (etc.) -- City, Country, Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code #9491). Whenever controller data is updated by an EC, the EC will be shipped to the most current TPC address.

- Specify #9503 for 3650 SNA Retail Store Systems requiring Release 3 RSS/Host Support under DOS/VS VTAM, OS/VS1 VTAM and OS/VS2 VTAM. All controllers shipped to new customers after June, 1976 require RSS/Host Release 3 and should be specified with #9503. Notes: (1) #9503 is a prerequisite for #1559, #1560 and #1564. (2) The corresponding release of 3650 RSS Host Support must be ordered. See SCP pages.

- System Changes: Specify one of the following:

- Changes to On-Order Network: If more than one 3651 is on order and the one with #9491 specified is deferred (or cancelled), the 3651 with #9492 specified and the earliest schedule date must be selected as the new 'first' 3651.

On the newly-selected 'first' 3651, delete #9492 and add #9491. In addition, specify all items required above when #9491 is ordered (item previously specified on the deferred or cancelled machine). On the deferred 3651, delete #9491 and add #9492, then delete all items associated with #9491 which are being added to the new 'first' 3651. It is also required to specify the 3650 Retail Store System Support Release which will be used.

- Changes to Installed Network -- MESS:

Important: Close coordination with host system location is required since changes to the entire network must be made concurrently.

If an installed 3651 with (#9491 and either #9501 or #9502 specified) is discontinued for any reason, an installed 3651 (with #9492 specified) must be selected as the first 3651 in the network. On the newly selected 'first' 3651, an MES is required to effect the following changes:

1. Delete #9492 and add #9491.
2. For #9491: Add #9501 or #9502.

- Changes at Host System Location Affecting 3651: If host system location changes the density of tape drives (e.g., from 800 bpi to 1600 bpi), the media Specify code must be changed on the on-order or installed 3651 with #9491 specified. The former media code must be deleted and a new one added.

- Store Loop Polarity Tester: One is furnished at each site at no charge. See "Accessories" for additional Store Loop Polarity Testers.

Notes:

- Tester matches receptacle ("Female Loop Connector"), P/N 5162880. See "Accessories".
- The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)

- RFI Standard: The RFI Standard (#2759) is now provided on all machines as standard.

SPECIAL FEATURES

Control Storage Features: The amount to be ordered is dependent upon the number and type of terminals attached to the system as well as system configuration and user programs. For available storage configurations, see Table A below.

Storage Increment - Type I (#1559): #1559 provides the 3651 with an additional 8,192 positions of storage. Maximum: One. Field Installation: Yes. (See Table A.) Prerequisites: #9503.

Storage Expansion (#1560): Contains 16,384 positions of storage to provide the capability of expanding storage beyond 57,344 positions to a maximum of 106,496 positions. Maximum: One. Field Installation: Yes. (See Table A.) Prerequisites: #9503.

Storage Increment - Type II (#1564): Each #1564 provides the 3651 with an additional 16,384 positions of storage. Maximum: Three. Field Installation: Yes. Prerequisites: #9503. (See Table A.)

Table A

Stor Conf	Feat Dist		
Total Stor	Stor Increment Type I	Stor Increment Type II	Stor Expansion
	8,192 Pos.	16,384 Pos.	16,384 Pos.
(A) 40,960	0	0	0
(B) 49,152	1	0	0
(C) 57,344	0	1	0
(D) 65,536	1	0	1
(E) 73,728	0	1	1
(F) 81,920	1	1	1
(G) 90,112	0	2	1
(H) 98,304	1	2	1
(I) 106,496	0	3	1

Notes:

1. Field installation of Storage Increment - Type I is only recommended in changing from configurations A, E and G. Storage Increment - Type II is not used in configuration A, B and D.

2. Customers who elect to purchase Storage Increment - Type I and later order additional storage should consider purchase of Storage Increment - Type II initially because some field upgrades of storage may require replacement of initial feature and installation of new feature.

Synchronous Clock and CCITT Interface (#2858): This feature provides interface for the host communication adapter for attachment of the 3976 Modem mdl 3 or a supported PTT-mandatory modem at 1200/600 bps. See M2700 pages for details. Operation at 600 or 1200 bps is selectable. Maximum: One. In Japan, #2946 must be specified to satisfy the NTT's DTE Self-Test requirements when attaching a non-IBM modem. Note: Required with specify code #2982.

Direct Attachment 3704/3705 (#2863): This feature, which operates at 2400 bps, provides the user (whose 3651 Store Controller, mdl A50 or B50 is located within 100 feet of a 3704 or 3705 Communications Controller with the ability to cable-connect these units without modems and a carrier communication line. Prerequisites: 3704 or 3705 must be equipped with Line Set, Type 1F (#4716). Field Installation: Yes. Note: With this feature, a 6m (20 ft) external modem cable is provided which is connected to the cable from the 3704 or 3705.

IML-Write Adapter (#4633): Provides the 3651 with the ability to write an IML (Initial Machine Load) tape on a user-provided tape cassette recorder (refer to "IBM 3650 Retail Store System Introduction Manual", GA27-3075), to be read by a Point-of-Sale terminal equipped with the IML-Read Adapter (#4632) feature. Maximum: One. Field Installation: Yes.

Local Loop Adapter, Add'l (#4882): This feature provides a second or third Local Loop Adapter on the 3651. Up to a maximum of 64 terminals can be attached to each additional Loop. The actual number of terminals will depend upon the program capacity and time requirements of the 3651 to service the Loops as well as the communication link to the Host processor (see "Terminal Devices" above). Limitations: Cannot exceed a total of three Loop Adapters (local or remote) per 3651. Maximum: Two. Field Installation: Yes. Specify: See Figure 1.

9600 bps Loop Adapter (#4890): Provides a 9600 bps local Loop Adapter. Available in lieu of a second or third Local Loop Adapter. The feature provides for the attachment of 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) feature installed. The actual number of 3275 Display Station mdl 3s installed will depend upon program capacity and time requirements of the 3651 to service the Loops and the communication link to the Host processor (see "Terminal Devices" above). Limitations: Cannot exceed a total of three Loop adapters (local or remote) per 3651. Only 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) can be attached to this Loop adapter. Maximum: One. Field Installation: Yes. Specify: See Figure 1.

Remote Loop Adapter (#6111): Provides online service for up to 12 remote sites per Remote Loop Adapter. Available in lieu of a second or third Local Loop Adapter. The feature provides an interface to a 3872 Modem or equivalent PTT-listed modem on site which via leased line connects to a 3659 Remote Communications Unit at each remote site. This allows for extension of the Loop to up to (1) three remote locations, with a 3659 at each site, (2) 12 remote locations, with a 3659 mdl 2 (multipoint) at each site, with a total of 64 terminals per Loop (see "Terminal Devices" above). The 3651 treats the remote Loop as if it were a local Loop. Limitations: Cannot exceed a total of three Loop adapters (local or remote) per 3651. Maximum: Two. Field Installation: Yes. Prerequisites: One 3872 Modem or equivalent PTT-listed modem with Point-to-Point (#6101) feature, Multipoint (no feature or #6302) or equivalent PTT-listed modem per Remote Loop Adapter at 3651 site and a 3659 Remote Communications Unit at each remote site. When more than one remote site is attached using 3659 mdl 1, a half-duplex 2-wire terminated, non-switched voice grade line is required between the 3651 and the first remote site, between successive remote sites, and from the last remote site back to the 3651. When only one remote site is to be attached, a duplex, 4-wire terminated nonswitched voice grade line is required. When using the 3659 mdl 2 for more than one remote site, 4-wire duplex multipoint service is required.

3784 Adapter (#8154): Provides the capability to directly attach one 3784 Line Printer mdl 1 to the 3651 controller. Fixed length cables are supplied as standard. Refer to "3650 PSS Installation Manual -- Physical Planning", GA27-3167. Maximum: One. Field Installation: Yes. Prerequisites: #9716 on the 3784. Minimum storage required on the 3651 is 48K.

Note: For attachment of the 3784 Line Printer, the controller must have EC 349850 applied and operating under RSS/Host Support Release 3. New 3651 controllers must have #9503 specified.

Figure 1

Loop Adapter Position	Loop *Adapter	Special Feature	Specify Code
2	Add'l	#4882	#9442
	Local		
	Remote	#6111	#9552
	9600 bps	#4890	#9662
3	Add'l	#4882	#9443
	Local		
	Remote	#6111	#9553
	9600 bps	#4890	#9663

* Loop Adapter Position 1 is occupied by the standard Local Loop Adapter. For Loop Adapter Position 2 and 3, either an Add'l Local (#4882) or Remote (#6111) or 9600 bps (#4890) Loop Adapter may be ordered. For each one ordered, also specify the applicable #9XXX code from the chart above. The 9600 bps Loop Adapter (#4890) may be ordered only once.

MODEL CONVERSIONS

The following model changes can be made in the field:

From	To		
	B50	A75	B75
A50	X*	X	X*
B50			X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

On purchased model 50 to model 75 changes, either Local Loop Adapter, Add'l (#4882 with #9442 or #9443) or Remote Loop Adapter (#6111 with #9552 or #9553) is a prerequisite on the model 50.

Customers who elect to purchase the 3651 model A50 or B50 and Storage Increment Type I (#1559) should consider the model A75 or B75 initially as field conversions to the model A75 or B75 require the replacement of this feature.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See "Physical Planning Manual", GA27-3074, or "3680 Site Planning and Site Preparation Guide", GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM.

Cables (P/N 7838695): Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b.) Maximum allowable cable temperature range is -34 C to +105 C. This Bulk Indoor Loop Cable P/N 7838695 should be ordered in multiple lengths of 304.8m (1,000 ft). Warranty: Loop Cable is warranted free from defects of workmanship and materials for 90 days.

Loop Accessories

Female Loop Connector (P/N 5162880): The Female Loop Connectors will be used in all positions of the 3650 Store Loops where terminals will potentially be installed. The corresponding male connector will either be the plug provided on each terminal or, in the case of the loop position currently not occupied by a terminal, the Loop Shorting Plug (see below).

Loop Shorting Plug (P/N 1860198): The Loop Shorting Plug will be used in all 3650 Store Loop positions that are not occupied by terminals. See "3650 Physical Planning", GA27-3074, for details.

Store Loop Polarity Tester (P/N 1859559): ** The Store Loop Polarity Tester is used by the customer to check Loop wiring prior to installing 3650 systems. One is provided at no charge for each 3651 site. See "Specify" section. For details, see "3650 Physical Planning Manual", GA27-3074.

SUPPLIES

Contact IBM.

3651 STORE CONTROLLER MDLS A60, B60**PURPOSE**

The control unit for a 3660 Supermarket System. Controls all functions of the 3663 Supermarket terminals. A 3669 adapter is included, which allows communication at 2400 bps over appropriate communication facilities with a properly equipped S/370, 30XX, or 4300 processor. The Dual Communications Adapter feature allows communications at 600/1200 bps with the host S/370, 30XX, or 4300 processor over switched network facilities. For backup purposes, the control unit, through the 3669 Store Communications Unit, can also communicate with and control 3663 Supermarket terminals in one other preassigned location. See "Communication Facilities" and "Prerequisites".

MODELS A60, B60

Model A60: 5 megabytes of integral disk storage

Model B60: 9.3 megabytes of integral disk storage

HIGHLIGHTS

Up to 24 3663 Supermarket terminal stations can be attached to a 3651 mdl A60 or B60 in one store. Each 3663 mdl 1 or each 3663 mdl 2 counts as 1 out of the 24. In addition, for backup purposes, a 3651 mdl A60 or B60 can control all the 3663 Supermarket terminals that are normally controlled by the other pre-assigned 3651 mdl A60 or B60 (normally at another location).

The 3651 mdl A60 or B60 (using the 3663 Supermarket Terminal) supports the following functions, in most combinations.

Customer Checkout:

- Automatic pricing through code lookup in a master price file
- Automatic handling of multiple priced items
- Automatic handling of mix and match group pricing
- Automatic distribution of net sales by department (up to 54)
- Automatic application of transaction discounts
- Automatic computation of sales taxes with automatic handling of taxable and non-taxable items
- Provision for tax exempt transactions
- Automatic control of maximum value of food stamps that should be accepted
- Check authorization facilities (positive or negative) through lookup against a check authorization record
- Computation of change due

All functions can be controlled to inhibit initiation by unauthorized personnel. Many capabilities which are available but are not applicable can be disabled at generation time via SDR (System Definition Records).

Store Support:

- Preparation of the following accounting reports:
 - Store summary
 - Individual cashier performance and tender reconciliation
 - Store office tender reconciliation
 - Sales by department (up to 54)
 - Distribution of miscellaneous income and disbursements by account
- Current inquiries for department sales, cashier performance and cash position, and store cash position
- Inquiries and changes to master price records and operator authorization control records
- Setting time and date for the internal clock
- Customer checkout training mode
- Printing miscellaneous messages received previously from the host S/370, 30XX, or 4300 processor

- Entry of miscellaneous messages for subsequent retrieval by the host S/370, 30XX, or 4300 processor
- Reporting of items returned by customers which are returned to stock
- Updating the system with data received from the host S/370, 30XX, or 4300 processor
- Shelf Label preparation

The above functions are compatible with variable length reconciliation periods, e.g., daily or weekly, and they are compatible with 24-hour store operation. All functions are individually controlled to inhibit initiation by unauthorized personnel.

Data Accumulation: The 3651 mdl A60 or B60 accumulates the following by-product data for subsequent retrieval by the host: Item movement totals, all accounting and performance totals used in store reports, totals of taxes and taxable sales, productivity totals for each terminal station in 15 minute increments, check authorization data requested, and individual logged entries covering coupons received, exception events, and security sensitive events.

Host S/370, 30XX, or 4300 Processor Transmission: The 3651 mdl A60 or B60 can transmit to the host, upon receiving a request, all of the data shown under "Data Accumulation", and other data, or records in the 3651. The 3651 will clear out data or records upon request by the host. The 3651 can receive records, record changes, commands or other pertinent data from the host.

Communication Facilities: For in-store operation, two store loops provide the communications linkage to the 3663 Supermarket terminals. See "Installation Manual - Physical Planning", GA27-3079.

The communications adapter permits operation over PTT-supplied C2, C3 or D5 facilities for out-of-store communications. For information concerning that facility, see M2700 pages.

Prerequisites:

A 3669 Store Communications Unit or a 3663 mdl 1 is prerequisite to add a 3663 mdl 2.

A properly equipped S/370, 30XX, or 4300 processor must be available. The S/370 must contain a virtual storage processor and can be any virtual storage S/370, 30XX, or 4300 processor. One of the following must be utilized:

- 3704, 3705, or 3725 Communications Controller, equipped with appropriate features.
- ICA feature on S/370 mdls 115, 125, 135, 135-3, 138.
- Communication Adapter Feature on 4331 Processor.

Limitations: The modem used by the 3704, 3705, 3725 or Communications Adapter on 4331 Processor must be either a 3872 or equivalent, an IBM 2400 bps Integrated modem or equivalent, 3976 mdl 3 or a PTT-mandatory modem with switched network features.

The Dual Communications Adapter is required if 600/1200 bps switched host communications and 2400 bps nonswitched backup communication is to be used. In Australia and New Zealand, host communications will be handled at 600/1200 bps on switched lines using either the Datel Switched Service Plan 32E or the Post Office Datel 600 Mandatory Service.

The Dual Communications Adapter is required if 600/1200 bps switched host communications and 2400 bps nonswitched backup communications is to be used.

Publications: GA27-3076

SPECIFY

- Power (AC, 1-phase):

MACHINES

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
235V #2814	230V #9904

(Japan only > For 100V 50/60 Hz, see RPQ 780210 for ordering instructions, prerequisites and limitations.<)

- RFI Standard: The RFI Standard #2759 is now provided on all machines as standard.
- Communications: #9071 for Binary Synchronous Communication, or #9072 for Synchronous Data Link Control Communication.
- Machine Nomenclature:

Canadian Eng #2934	Italian #2932
Canadian Fr #2935	Spanish #2931
French #2928	UK English #2927
German #2929	US English #2750
- Controller Designation: Specify #9491 on the first 3651 to be used with a host system location and #9492 on each additional 3651 in the network.

Note: The physical location of the host system is required to be specified on the order when #9491 is specified. When #9491 is specified, additional information must be specified as follows:

- Specify one of the following to indicate magnetic tape density (media) used at the host system location. This tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.
 - #9412 -- 9-track 800 bpi
 - #9413 -- 9-track 1600 bpi
 - #9414 -- 9-track 6250 bpi

The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

- Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

Line 1 -- IBM Programming Systems Representative
Line 2 -- c/o (Name of Customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 (etc.) -- City, Country, Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code #9491). Whenever controller data is updated by an EC, the EC will be shipped to the most current TPC address.

Note: The 3660 Supermarket System Host Support must be ordered from ISD. See SCP pages.

- Store Loop Polarity Tester: Order Store Loop Polarity Tester, P/N 1859559 for site of store Loop wiring. One is furnished at each site at no charge. See "Accessories" for additional Store Loop Polarity Testers.

Notes:

- Tester matches receptacle ("Female Loop Connector"), P/N 5162880. See "Accessories".
- The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)

SPECIAL FEATURES

Dual Communications Adapter (#2901): This feature provides two separate interfaces to two different modems or services. One

interface attaches a 3669 mdl 3. The other interface attaches the following:

- 3976 mdl 3: All WT countries and where PTT modem is mandatory.

Only one of the two connection paths is active at any one time. The attached modems must include auto answer capability.

Business machine clocking is provided to the modems for speeds of 600/1200 bps. Modem clocking is used for 2400 bps.

This feature is required in countries where a switched network facility at 2400 bps is not supported through the 3669 or RPQ equivalent. Specify: Modem Service (specify one): #2977 for 3976 mdl 3 or PTT-mandatory modems at 1200 bps on switched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin.

Storage Increment (#7680): Provides the 3651 with 8,192 bytes of additional control storage. Maximum: One. Field Installation: Yes. System RPQs: The following 3660 System RPQ can be ordered.

- RPQ 7B0211 - PTT-Mandatory Interface on 3669 Store Communications Unit mdl 3 for backup on leased lines where PTT-Mandatory modem is required.

MODEL CONVERSIONS

Model Changes between the model A50 or B50 and the model A60 or B60 are not recommended for field installation. 3651 features cannot be interchanged between model A60 and a model 50 or 75.

Model changes can be made in the field from model A60 to B60, A75 and B75, and from B60 to B75. Changes from A to B models require the replacement of integral disk storage. This change requires replacement of the integral disk storage. Adequate provision must be made for retaining the data contained on the replaced disk storage. All replaced parts become the property of IBM.

The following model changes can be made in the field:

	To B60	A75	B75
From A60	X	X	X*
B60			X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See "Physical Planning Manual", GA27-3074, or "3660 Site Planning and Site Preparation Guide", GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Specify: Bulk indoor loop cable P/N and number of feet desired. Allow a lead time of 120 days.

Cables (P/N 7838695): Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b.) Maximum allowable cable temperature range is -34 C to +105 C. "This Bulk Indoor Loop Cable" (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). Allow a lead time of 120 days. Warranty: Loop Cable is warranted free from defects of workmanship and materials for 90 days.

MACHINES

Loop Accessories

Female Loop Connector (P/N 5162880): The Female Loop Connectors will be used in all positions of the 3650 Store Loops where terminals will potentially be installed. The corresponding male connector will either be the plug provided on each terminal or, in the case of the loop position currently not occupied by a terminal, the Loop Shorting Plug (see below).

Loop Shorting Plug (P/N 1860198): The Loop Shorting Plug will be used in all 3650 Store Loop positions that are not occupied by terminals. See "3650 Physical Planning", GA27-3074, for details.

Store Loop Polarity Tester (P/N 1859559): ** The Store Loop Polarity Tester is used by the customer to check Loop wiring prior to installing 3650 systems. One is provided at no charge for each 3651 site. See "Specify" section. For details, see "3650 Physical Planning Manual", GA27-3074.

Major Revision

3653 POINT OF SALE TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

An intelligent input/output terminal for the 3650 Programmable and Retail Store System to provide retail point-of-sale data collection, credit authorization, and inquiry functions. Self-contained intelligence allows the 3653 to continue most sales functions when disconnected from the 3650 system after a parameter initialization from either the Store Controller or Magnetic Wand Reader.

MODELS

- Model 1 001** Not customer-programmable. Attaches to 3651 models B25, (Canada only - C25, -) A50, B50, A75, B75, C75 and D75.
- Model 1P P01** Customer programmable. Optionally will function as a model 1 (non-customer programmable). Attaches to 3651 models B25, (Canada only - C25, -) A50, B50, A75, B75, C75 and D75. When attached to Model A50 or B50, it can function as a model 1 only. Basic storage is 36K bytes. This may be increased to 60K bytes through installation of Storage Increment features.

HIGHLIGHTS

A solid state, unitized, packaged unit. It features: data entry via the magnetic wand reader feature and a 10 numeric-key, 19 function-key keyboard; step-by-step display of operator instructions; printing of data in response to an inquiry; display of numeric data as it is being key entered; transmission of data to a 3651 for logging over a unique transmission line capable of handling large volumes of short messages from many terminals; and a cash drawer with removable till.

Keyboard: A 10-key numeric pad (machines shipped to the UK will have one additional key for the halfpence) and nineteen function keys provide entry for variable source data. Types of transactions are indicated through the numeric pad, as well as data fields. Once a field has been entered, the depression of a function key causes one or more of the following functions to happen: Editing for minimum and maximum field length; modulo check; price look-up; credit authorization, printing; transmission to the 3651; and, change in guidance or error feedback.

Printer: A 3-station printer which produces a cash receipt or sales-check as well as a journal for each transaction.

Display: An 8-digit numeric display plus monetary symbol and "--" with five backlit captions shows numeric data as it is being keyed, extended prices, status codes for credit referrals, subtotals, totals, amount due, change, and refund amounts.

Operator Guidance: Step-by-step instructions are provided to the operator for each transaction by twenty backlit messages. Additional guidance is provided by the type of transactions shown on the numeric keys.

Status Indicators: Advise the operator that the terminal is: ready for use, waiting for a response to an inquiry or transmission to the 3651, offline from its 3651, or that the journal roll take-up spool is full.

Selectable Functions: A limited number of additional functions may be selected to further extend the flexibility of the 3653 mdl 1 (or 1P when functioning as a mdl 1).

Special Contract/Proposal Considerations: Special contract terms will apply for the purchase and maintenance of the 3653. These terms will relieve IBM of responsibility for any loss of cash contained in a 3653 after its delivery to the customer.

IBM will not provide warranty or maintenance service on a 3653 containing cash. The customer will be responsible for removing, controlling, and replacing cash so that IBM can fulfill its warranty and maintenance obligations. The specific contractual terms will be made available by country headquarters.

The 3653 is maintained under "Central Facility" type maintenance.

Prerequisites: The 3650 system controller is a 3651 Store Controller mdl 25, 50 or 75. See M3651 pages for details.

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement letter must include the following statement:

"It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3653 which contains cash or other

valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations.

When a failure occurs in a cash drawer of any 3653 and it cannot be opened prior to maintenance by IBM, the customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Customer Responsibilities:

1. The customer must provide (purchase, install, and maintain) all the necessary 3650 communication lines and female connectors within the store. See "Customer Responsibilities" in the M2700 pages for customer responsibilities concerning communication facilities between the 3651 and the host S/370 or 4300 processors, and between the 3651 and remote sites.
2. The customer is responsible for using the IBM-provided problem determination procedures for identifying the failing unit.
3. The use of the magnetic stripe on the merchandise ticket, credit card, and employee badge was chosen for the 3650 Retail Store System because of its advantages over other encoding methods. The encoding on the tickets, cards, and badges contains data integrity formats and check characters. This does not imply, however, that they are not subject to fraud techniques. Implementing of any additional data security is the responsibility of the customer.
4. Because the 3653 terminals are interchangeable, the customer may wish to replace the failing unit with a spare and must be advised to procure sufficient spare units for such use by him.

The number of spare units needed by the customer depends on the number of units he has installed, his application requirements, his physical store location and layout, etc. An estimated minimum number of spare units, based upon the number of units actually installed, is shown in the following table:

Units Installed	Minimum Spare Units Recommended
10-20	1
20-30	2
30-50	3
50-70	4
70-100	5
100 or more	6

Maintenance: Installation of 3653s in the immediate sales area may preclude the acceptability of online repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the failing terminal to a repair facility located within the store for subsequent repair. It will be the Customer's responsibility to ascertain this failing terminal and move it to the repair site. At this location the CE will repair and test the terminal online via a customer-provided store loop termination.

Bibliography: IBM 3650 Retail Store System Introduction, GA27-3075.

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	208V #9902
220V #2813	230V #9904
235V #2814	

Note: For France only, the higher voltage group is available.

Plugs: Machines are furnished with power plugs selected by country code.

- Machine Nomenclature:

Canadian English #2934	German #2929
Canadian French #2935 *	Italian #2932
English UK #2927	Japanese #2930
English US #2750	Spanish #2931
French #2928	

* plus RPQ X45628

3653 Point of Sale Terminal (cont'd)

RPOs will be accepted for additional nomenclatures not mentioned here. Note: All 3653s shipped to WT countries contain the required special characters for the following countries:

Austria/Germany	Finland/Sweden
Belgium/France	Italy
Canada (English)	Japan
Canada (French)	Portuguese-speaking
Denmark/Norway	Spanish-speaking

The applicable Character Set will be selected by programming and need not be specified here.

- Journal Lock: **#9322** if lock is desired on access cover to journal take-up roll, journal tape supply, and cash receipt tape supply. For additional or replacement locks and keys, see "Accessories".
- Till Cover with Lock: **#9770** if top cover for cash drawer till is desired. For additional tills and covers and additional or replacement cash drawer locks and keys, see "Accessories".
- Till with movable bill dividers: **#9799** if movable bill dividers are desired. Otherwise, a till with fixed bill dividers will be supplied.
- Decimal Quantity Key: Specify **#2901** if the Decimal Quantity Selectable Function is chosen. Provides a key on the 3653 keyboard with appropriate nomenclature is the key position above the "Quantity" key.
- Cash Drawer Lock: The 3653 is equipped with a cash drawer lock. A group of 25 unique lock numbers has been reserved to allow a customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following types on the 3653 order:

#9101	#9106	#9111	#9116	#9121
#9102	#9107	#9112	#9117	#9122
#9103	#9108	#9113	#9118	#9123
#9104	#9109	#9114	#9119	#9124
#9105	#9110	#9115	#9120	#9125

If none is specified, a lock will be selected at random from a larger group of lock types; each 3653 will be shipped with two cash drawer keys. For additional or replacement keys, see "Accessories".

- Adding Machine Layout on Modifiable Keyboard: Specify **#2996** provides an "adding machine" layout of the numeric keys instead of the "touch-tone" pad layout normally shipped on the Modifiable Keyboard feature (**#4990**). Adding machine layout provides a key arrangement of: Top row (7,8,9); middle row (4,5,6); bottom row (1,2,3). **Field Installation:** Not recommended.

SPECIAL FEATURES

Functional Expansion Increment - Type I (#4223): [Mdl 1] Provides the 3653 with the capability to support additional functions. The capability provided by this feature is equal to that provided by Functional Expansion (#4222) (see Note 1 below). **Limitations:** The third Type I Increment (#4223) cannot be installed on a 3653 with Functional Expansion Increment - Type II (#4224). #4223 is mutually exclusive with #4222 (see Note 2 below for allowable configurations). **Maximum:** Three. **Field Installation:** Yes.

Functional Expansion Increment - Type II (#4224): [Mdl 1] Provides the 3653 with the capability to support additional functions. The capability provided by this feature is twice that provided by Functional Expansion Increment - Type I (#4223) (see Note 1 below). **Limitations:** Cannot be installed on 3653 with third Functional Expansion Increment - Type I (#4223). #4224 is mutually exclusive with #4222. See Note 2 below for allowable configurations. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Must have two Functional Expansion Increment - Type I (#4223) installed.

Storage Increment (#4225): [Mdl 1P] Provides an additional 8,176 bytes of storage. **Maximum:** Three. **Field Installation:** Yes.

IML-Read Adapter (#4632): Provides a means to initialize 3653 terminals when a 3651 Store Controller mdl B25, (Canada only - C25, -) A75, B75, C75 or D75 is unavailable or unable to provide the IML (Initial Machine Load). An adapter is provided for attaching an external tape cassette recorder (refer to *IBM 3650 Retail Store System Introduction*, GA27-3075) and reading data previously recorded at a 3651 equipped with the IML-Write Adapter (#4633). **Maximum:** One. **Field Installation:** Yes.

Magnetic Wand Reader (#4944): A hand operated wand used to read single track delta distance encoded magnetic merchandise tickets,

credit cards, and employee badges. The small lightweight wand attached via a four foot long, flexible cord, allows encoded merchandise tickets to be read without removing them from the merchandise. See Notes 3 and 4 below. **Maximum:** One. **Field Installation:** Yes.

Modifiable Keyboard (#4990): Provides an alternate keyboard designed to aid in faster keying and in customizing to a user's requirements. Provides up to 16 department motor keys. **Maximum:** One. **Field Installation:** Not recommended.

Notes:

- Order Confirmation of allowable or maximum combination of additional functions to be used with Functional Expansion Increments must be obtained from IBM.
- The table below defines Plant Installable configurations and the maximum allowable field upgrades of #4223 and #4224.
- The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request.
- See "Program Loading at Power-On Time" below for other use of wand.

Number Of Functional Expansion Increments
If Plant Installed Configuration is:

Type I (#4223)	0	0	1	1	2	2	2	3
Type II (#4224)	0	0	0	0	0	0	1	0

Is Field Upgrade Possible?

Yes Yes Yes Yes Yes Yes No *

Maximum Upgrade Above Plant Installed Configuration Allowable is:

Type I (#4223)	2	3*	1	2*	1*	0	0	0
Type II (#4224)	1	0	1	0	0	1	0	1*

* Customers who elect to purchase the third #4223 and anticipate later ordering #4224 should consider purchase of #4224 initially because field upgrade requires the replacement of the third #4223.

Program Loading at Power-On Time
With 3650 Retail Store System Release I:

3651 Available: The IML and Parameter Initialization are loaded from the 3651 Store Controller.

3651 Unavailable: The IML must be obtained from a back-up 3651 Store Controller Parameter Initialization is accomplished by wand using magnetically encoded tickets with the Magnetic Wand Reader (#4944) at each 3653.

With Retail Store System Release II and Release III:

3651 Available: The IML, selectable functions and Parameter Initialization are loaded from the 3651 Store Controller.

3651 Unavailable: The IML, selectable functions and Parameter Initialization requires one 3653 with the IML-Read Adapter (#4632) feature on each local loop and at each remote location.

With 3650 Programmable Store System:

3651 Available: This IML is loaded from the 3651 Store Controller.

3651 Unavailable: The IML requires one 3653 with the IML Read Adapter (#4632) feature on each local loop and at each remote location.

MODEL CONVERSIONS

Model changes from model 1 to model 1P can be made in the field. All replaced parts of the base model become the property of IBM. The Functional Expansion features (#4222, #4223 and #4224) cannot be interchanged between the model 1 and the model 1P and would remain with the customer if a model change is made.

ACCESSORIES

Cash Till and Cover With Lock: Additional cash tills and till covers with locks may be ordered.

3653 Point of Sale Terminal (cont'd)

Note: See "Locks and Keys" later in this section.

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

VERSION	STEM NUMBER/KEY ALIGNMENT
OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal
-B	Small raised projection in keytop
-C	Circular, concave top on key button
-M	Minimal concavity of circular keytop
SIZE	UNITS
Square	1 x 1
Single	1 x 1-1/3
Long	1 x 2
Double	1-1/3 x 2

Engraved Keytops: Keytops containing pre-defined messages are available for use on the 3653 terminal keyboards. Blank keytops are also available for customer engraving.

Retail Keytops: The following is a list of pre-defined keytops available in the 3650 Retail Store System nomenclature:

Universal Keytops: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3653 Retail terminals. These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in the four standard sizes and in two heights. They consist of two parts; a white bottom button and a clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with

Key Stops (P/N 1650058): * The key stop is a small ring collar which is placed over the stem of a keybutton and under the keytop. The collar holds the keytop in the up position and prevents its use.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device which fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard.

Two keytop extractors are supplied with each 3651 controller. The customer may desire additional extractors.

Locks and Keys: The 3653 is equipped with a cash drawer lock and can be equipped with an optional journal lock (#9322). The terminal is shipped with two cash drawer keys. The cash drawer lock will be randomly selected unless specified otherwise. If the customer wishes to add or replace keys or locks with a specific identification number (stamped on lock and key) he should state the 3653's machine serial number and the key identification number. **Note:** Without a Key Identification Number, the order should state Machine Serial Number and the words "NEW LOCK REQUIRED". If the optional journal lock is specified, the terminal will be shipped with two journal keys also. Additional or replacement keys may be purchased from IBM or a local locksmith. Cash Drawer Lock Key blank part numbers are listed below if the customer requires key blanks and/or for replacement keys if ordered from IBM. Locks may be changed in the field. Allow eight weeks for shipment.

3653 Cash Drawer Lock (including two keys), P/N 1851086

3653 Journal Lock, P/N 5998329

3653 Journal Lock Key, P/N 5182265* (order by machine type and P/N)

3653 Cash Drawer Lock Key, (order by machine type, lock serial number, and key P/N from the following chart):

Lock Serial Number	Lock Key Blank P/N
H2601 - H2800	8549431
H2801 - H3000	8549482
H3001 - H3200	6021144
H3201 - H3400	6021145

Note: For each set of keys, specify machine serial number, key type (cash drawer or journal), key identification number (stamped on key).

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 1136970 or equivalent, should be used for machines installed prior to June, 1975. Machines installed after this date and those machines previously installed that are changed

3657 TICKET UNIT

PURPOSE

Magnetic Merchandise Ticket Input/Output Unit for the 3650 Programmable and Retail Store System.

MODELS

Model 1 001

Maximum: The maximum number of 3657s that can be attached to a 3651 depends upon the number of positions available and the traffic volumes and response times required.

Prerequisites: An available loop position.

HIGHLIGHTS

The 3657 is an online, high-speed batch ticket encoder that can also perform batch ticket reading. Tickets are one inch high and contain a magnetic stripe 1/4-inch wide that runs the length of the ticket. The 3657 encodes this stripe with machine readable data which is read by the 3657 or by a wand reader available on the 3653 Point of Sale Terminal. Tickets also contain two lines of human readable data.

Two general types of tickets are used. For additional ticket types, contact IBM for details.

Two types of tickets used:

- (1) Label -- 1-inch x 1-inch self-adhering paper stock with a protective backing. The 1-inch x 1-inch label dimension applies to label and backing. The label when detached is approximately 0.940-inch x 0.940-inch.
- (2) Tag -- 1-inch x 2-inch and 1-inch x 3-inch heavy-duty paper stock attached to merchandise by hanging or stapling.

Input: 1-, 2- or 3-inch roll stock or 2-inch individual tags.

Batch Reading: Individual 2-inch tickets can be read from a cartridge. Tickets are fed from a removable cartridge and, if successfully read, directed to a ticket bin. Tickets that are unsuccessfully read are stacked into an identical cartridge. Additional or replacement cartridges can be ordered.

Output: 1-, 2- or 3-inch roll, strip or 2-inch individual tags.

Rated Speed: Speed is dependent on length of ticket, number of header tickets, output method selected and competing traffic on the Loop.

Header Tickets: Are print-only tickets which may be interspersed in the ticket output stream for batch or purchase order identification. Header tickets are not considered as merchandise identifiers.

Tickets per Minute

Ticket Size	Approximate Speed
1-inch roll	500
2-inch roll	250
3-inch roll	167
2-inch individual	130 (both make mode and read mode)

Printing: The two lines of human readable data are printed with two identical 8-wire matrix print heads. Characters are 0.117 inch high spaced 12 characters per inch. A 64-character set oriented to the retail industry is provided. Uses a cassette ribbon replaceable by the customer ... Contact IBM.

Ticket Data Content

Ticket Size	No. Characters	
	Encode	Print
1-inch	19	22
2-inch	40	42
3-inch	60	64

SPECIFY

- Power (AC, 1-phase):

- Graphic Feature:

English UK #2958	Italy #2968
English US #2956	Japan #2955
France #2964	Spanish Speaking #2969
Germany #2957	

- Katakana Graphic Print: #2894, if desired. This feature provides a 121-character set consisting of 57 Katakana (Japanese) characters in addition to the standard set of 64 characters.

MODEL CONVERSIONS None

ACCESSORIES

Hopper/Stacker Cartridge (P/N 5560620): The 3657 is shipped with two hopper/stacker cartridges. Additional or replacement cartridges may be purchased.

SUPPLIES

Merchandise tickets may be purchased from the National Distribution Division. For information pertaining to prices and delivery schedules, contact IBM.

MACHINES
3661 STORE CONTROLLER

[NO LONGER AVAILABLE]

PURPOSE

The control unit for a 3660 Supermarket Key-Entry System controls all functions of the 3663 Supermarket terminals and provides for communication with the appropriate Host System. See "Communication Facilities" and "Prerequisites".

MODELS

Model 1 001 A controller that houses a direct access diskette drive with a 1-sided removable diskette.

Prerequisites: One 3663 Supermarket Terminal mdl 2 must be locally attached.

A properly equipped S/370, 30XX or 4300 processor must be available. The S/370, 30XX or 4300 processor must contain a virtual storage processor. For minimum configuration requirements, refer to S/370, 30XX or 4300 System Programming pages. In addition, either a 3704 or 3705 must be used or an ICA on a S/370 mdl 115, 125, 135, 135-3 or 138, or a Communications Adapter (#1601) feature on the 4331. 1200 bps external modems may be used with 3704, 3705, and ICA on S/370 mdl 115, 125, 135, 135-3 or 138, or a Communications Adapter (#1601) feature on the 4331. 1200 bps internal modems may be used with 3704, 3705, and ICA on S/370 mdl 115 or 125, or a Communications Adapter (#1601) feature on the 4331. For required features, see M2700 pages.

Communication Feature - one of the following arrangements must be used:

- (1) Communications Feature With Clocking (#1482), Interface (#3701), and an external modem operating at 1200 bps, or
- (2) Communications Feature With Clocking (#1482), 1200 bps Integrated Modem-Switched (#5501), and FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.

IBM has not tested the 3660 Supermarket Key-Entry System on non-virtual IBM Systems. If a customer elects to establish communications with other than a virtual host system, he must understand that IBM does not assume responsibility for the resolution of any programming problems resulting from this system configuration.

HIGHLIGHTS

Up to 12 3663 Supermarket Terminals may be included in a 3660 Supermarket Key Entry System. One 3663 mdl 2 must be attached to the 3661 via local attachment, (standard) and a second 3663 mdl 2 may be attached to the 3661 via the optional 3663 mdl 2 Local Attachment Feature. All other 3663 Terminal Stations in the system, up to 11, depending locally upon the number of locally attached stations, are attached via a store loop.

The 3661 with the 3663 Supermarket Terminals provides the following functions:

Customer Checkout:

- Automatic pricing through code look-up in a master price file for up to 250 items standard and up to 1,275 items with Add'l Storage (#1222).
- Automatic handling of multiple priced items in master file.
- Automatic handling of mix and match group pricing for items in the master price file.
- Automatic distribution of net sales by department.
- Automatic application of transaction discounts.
- Automatic computation of sales taxes, if applicable, with automatic handling of taxable and non-taxable items.
- Check verification facilities (negative with reason code) through look-up against a check verification record.
- Computation of change due.

All functions can be controlled to inhibit initiation by unauthorized personnel.

Store Support: Preparation of the following accounting reports:

- Store Summary
- Individual cashier performance and tender reconciliation
- Store office tender reconciliation
- Sales by department (up to 9)
- Distribution of miscellaneous income and disbursements by account.
- Current inquiries for department sales, cashier performance and cash position, and store cash positions.
- Maintenance of master price file, check verification file, and operator authorization file.
- Productivity totals for each terminal station and store totals in 60 minute increments.
- Setting time and date for the internal clock.
- Customer checkout training mode.
- Printing miscellaneous messages received previously from from the host.
- Entry of miscellaneous messages for subsequent retrieval by the host.
- Reporting of items returned by customers which are returned to stock.
- Updating the system with data received from the host.
- Shelf Label Preparation.

Most store support functions may be performed concurrently with customer checkout. All functions are individually controlled to inhibit initiation by unauthorized personnel.

Data Accumulation: The 3661 accumulates the following by-product data for subsequent retrieval by the host: Item movement totals, all accounting and performance totals used in store reports, totals of taxes and taxable sales, if applicable, productivity totals for each terminal station in increments of sixty minutes, exception events, and security sensitive events.

Host S/370, 30XX or 4300 Processor Transmission: The 3661 can transmit to the host, upon receiving a request, all of the data shown under "Data Accumulation" and other data or records in the 3661. The 3661 will clear out data or records upon request of the host. The 3661 can receive records, record changes, commands or other pertinent data from the host. See "Programming Support" section for description of host, programming support, and requirements. Host communication cannot be performed concurrently with customer checkout or store support procedures.

Communication Facilities: For in-store operation, a store loop provides the communication link to the 3663 Supermarket Terminals. See *Installation Manual-Physical Planning*, GA27-3079, for further information.

The Communications Adapter permits operation at the speeds indicated over the facilities shown below when using the appropriate modem. For information concerning the facilities, see M2700 pages.

SPECIFY

- Power (AC, 1-phase):

50 Hz 110V #2805 123.5V #2811 220V #2813 235V #2814	60 Hz 115V #9901
--	----------------------------
- Communications:
 - Binary Synchronous Communication #9075
 - Synchronous Data Link Control #9076
- Modem Cable (external modem): A 10-foot cable to the modem is standard. If a longer cable is required, specify #9442, indicating length as a quantity of 20, 30, 40, or 50 feet.
- Store Loop Polarity Tester: Order Store Loop Polarity Tester, P/N 1859559, from plant of manufacture. One is furnished at no charge to each 3660 site for testing Store Loop wiring.

Note: Tester matches receptacle P/N 5162880 which can be ordered on MES or PSR from Raleigh.

3661 Store Controller (cont'd)

- Machine Nomenclature (specify one):

Canadian English #2934	German #2929
Canadian French #2935	Italian #2932
English US #2750	Spanish #2931
French #2928	

SPECIAL FEATURES

Add'l Storage (#1222): Provides an additional 8,192 bytes of storage to increase the number of item records from a minimum of 250 to a maximum of 1,275. **Maximum:** One. **Field Installation:** Yes.

Communications With Clocking (#1482): Required for attachment to communication facilities through the 1200 bps Integrated Modem (#5501) or any external modem which does not have internal clocking. Also required for CCITT Interface (#3701). **Maximum:** One. **Field Installation:** Yes.

CCITT Interface (#3701): Provides the appropriate cables and interface logic necessary to attach the following:

- Datel Switched Service Plan 32 - Australia
- Datel 600 Switched Service - New Zealand

Limitations: Cannot be installed with 1200 bps Integrated Modem, Switched (#5501). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched (#5501): Provides the point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. **Limitations:** Cannot be installed with Interface (#3701). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1482. The user must provide FCC-registered protective circuitry of the CBS type (or equivalent).

Scale Adapter (#6672): Allows attachment of an electronic scale that meets the interface requirements in *Scales Interface to the IBM 3663 Supermarket Terminal* document which is available from Corporate Industry Relations for use with locally attached 3663 mdl 2. **Maximum:** Two. **Field Installation:** Yes. **Specify:** #9576 if scale will be used with first 3663 mdl 2, or #9577 if it will be used with second 3663 mdl 2.

3663 Mdl 2 Local Attachment (#8110): Provides for the local attachment of a second 3663 mdl 2. **Maximum:** One. **Field Installation:** Yes. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3661.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual*, GA27-3074, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM.

Cables (P/N 7838695): Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable -- UL-approved for duct and plenum installation (NEC Art. 725-2b) ... maximum allowable cable temperature range is -34 C to +105 C. This bulk indoor loop cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). Allow a lead time of 120 days. **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

SUPPLIES

Contact IBM.

3663 SUPERMARKET TERMINAL

PURPOSE

In conjunction with the 3651 mdl B25, (Canada only) C25, +IA60, B60, A75, B75, C75, D75 Store Controller or the 3661 Store Controller, the 3663 Supermarket Terminal provides the input and output facilities necessary to process transactions in a supermarket environment. It replaces and extends the function of mechanical supermarket registers.

MODELS

- Model 1** 001 Station and Control -- One printer, display, keyboard, cash drawer and control segment for operating one checkstand.
- Model 1P** P01 [NO LONGER AVAILABLE] Station and Control -- One printer, display, keyboard, cash drawer and customer programmable control segment for operating one checkstand.
- Model 2** 002 Station Only -- One printer, display, keyboard, and cash drawer that attaches to a 3663 model 1, 1P or 3P or the 3661 Store Controller, for operating additional checkstands. One 3663 model 2 must be attached to the 3661, a second and a third 3663 model 2 may be attached via #8110 and #8111 respectively (#8110 is a prerequisite for #8111.)
- Model 3P** P03 [NO LONGER AVAILABLE] Control Segment Only -- A customer programmable control segment for controlling one or optionally up to three, 3663 model 2s. **Note:** The first 3663 model 2 attachment is provided in the basic 3663 model 3P.

Limitations: The mdl 1 is not available in conjunction with the 3651 Store Controller mdl B25, A75, B75, C75, or D75.

The mdl 1P is not available in conjunction with the 3651 Store Controller mdl A60 or B60 - Supermarket or with the 3661 Store Controller.

The mdl 3P is not available in conjunction with the 3651 Store Controller mdl A60 or B60 - Supermarket or with the 3661 Store Controller.

Prerequisites: One 3663 mdl 2 must be attached to the 3663 mdl 3P.

With 3651 Store Controller mdl B25, (Canada only) C25, A75, B75, C75 or D75: (1) An available store loop position ... (2) For attachment of a 3663 mdl 2 to the store loop, a 3663 mdl 1P with a Mdl 2 Attachment Feature is a prerequisite unless the 3663 mdl 2 is attached to a 3663 mdl 3P. For attachment of a 3663 mdl 2 to a 3663 mdl 3P, a Mdl 2 Attachment Feature (#4900) is a prerequisite if it is the second 3663 mdl 2 attached to the 3663 mdl 3P. A 3rd Mdl 2 Attachment Feature (#4901) is a prerequisite if it is the third 3663 mdl 2 attached to the 3663 mdl 3P. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3663 mdl 3P.

With 3651 Store Controller mdl A60 or B60: (1) A 3669 Store Communications Unit and an available store loop position ... (2) A 3663 mdl 1 with a Mdl 2 Attachment (#4900) feature is prerequisite for each 3663 mdl 2 to be added to a store loop.

With 3661 Store Controller: (1) An available local attachment on the 3661 or a store loop position. **Note:** One 3663 mdl 2 must be attached to the 3661 via the standard local attachment. One or two additional 3663 mdl 2s can be locally attached via optional Local Attachment Features ... (2) For attachment of a 3663 mdl 2 to the store loop a 3663 mdl 1 with a Mdl 2 Attachment Feature is a prerequisite, unless the 3663 mdl 2 is attached to a 3663 mdl 3. For attachment of a 3663 mdl 2 to a 3663 mdl 3, a Mdl 2 Attachment Feature (#4900) is a prerequisite if it is the second 3663 mdl 2 attached to the 3663 mdl 3. A 3rd Mdl 2 Attachment Feature (#4901) is a prerequisite if it is the third 3663 mdl 2 attached to the 3663 mdl 3. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3663 mdl 3.

HIGHLIGHTS

Has a storage area for each station into which keyed (or scanned if a 3667 Checkout Scanner is attached) data is entered prior to being transmitted to the 3651 Store Controller mdl B25, (Canada only) C25, A60, B60, A75, B75, C75 or D75 or the 3661 Store Controller. Checks for code accuracy, sequence control, field length, and correct number of fields. Another storage area at each station is used for receiving a previously entered message after being processed at the 3651 mdl B25, (Canada only) C25, A60, B60, A75, B75, C75 or D75 or the 3661. Upon

receiving messages, data is edited and transferred to the printer and display.

With the appropriate special adapter features, the 3663 can attach non-IBM coin and trading stamp dispensers, non-IBM front end scales, and 3667 Checkout Scanners. In addition, a Document Insert feature can be added to the printer to allow "franking" (printing special data) on checks.

Keyboard: Has a ten-key numeric pad plus function keys. In part these include department keys, special item modification keys (for price, quantity and weight entries), tender payment keys, coupon entry keys, and other related supermarket required keys. (See the *IBM 3660 Supermarket System Introduction Manual*, GA27-3076, or the *IBM 3650 Programmable Store System Introduction Manual*, GA27-3163, for details).

Printer: Has two tape print locations as standard. Using a horizontal radial printing technique, the first tape printed is the customer receipt. The second tape is for summary journal data. An optional Document Insert feature position may be added. Alphameric printing is accomplished with a dot matrix print head. Printing in each position is up to 30 characters. Customer receipt tape printing is at 80 lines per minute. Summary journal tape printing is at 50 lines per minute. Document Insert printing is at 35 lines per minute. Shelf labels can be printed at 3-4 labels per minute, depending upon the size of the label.

Cash Drawer: Has a removable and lockable till with five spring-weighted bill compartments and five coin compartments. The bill compartments are adjustable to accommodate varying bill sizes existing in different countries.

A 3-position lock controls power to the station and manually opens the drawer regardless of power status. The key is removable in any position. No terminal function can be initiated with the drawer open.

Display: A variable character display panel allows displaying an alphameric message of up to 22 characters in length. Characters are 0.4 inches high and variable in width.

Communications: Provided over two 2-wire customer-provided loops called store loops. Messages from the 3651 mdl B25, (Canada only) C25, A60, B60, A75, B75, C75 or D75 or the 3661 are monitored by the 3663 Supermarket Terminal for terminal destination. A pluggable address scheme is provided for terminal numbering. See the *Installation Manual - Physical Planning*, GA27-3079, for the 3660 Supermarket System and *Installation Manual - Physical Planning*, GA27-3167, for the 3650 Programmable Store System.

Packaging: Stations can be specified fully integrated (all I/O segments under a single cover) or integrated with a remote display. An optional special feature with a specify code will provide a distributed station (I/O segments separately covered to allow location flexibility).

Customer Responsibilities:

1. See M2700 pages for customer responsibilities concerning communications facilities.
2. Customer is responsible for obtaining, installing, and testing the necessary store loops, including the set of connectors required for each terminal and Store Loop junction box. See the *Installation Manual-Physical Planning* for the 3650 Supermarket System. Also see "Proposal Considerations" in the General Information section for use of a Polarity Tester.
3. In cooperation with the marketing representative, and the CE Installation Planning Representative, order the required system cables from IBM.
4. The customer is responsible for laying and/or routing all 3663 cables (supplied by IBM or by non-IBM supplier for attached devices) and providing suitable protection for these cables. IBM-supplied cables will be shipped 30 days prior to shipment of IBM components to provide sufficient time for installation of these cables. See the *Installation Manual-Physical System* for the 3660 Supermarket System for further details.
5. The customer is responsible for providing a facility to support all station segments, distributed or integrated. One integrated station may be located on the control segment if desired.
6. The customer is responsible for obtaining and maintaining the additional features required to complete a checkout environment beyond those elements supplied by IBM.
7. The customer is responsible for ensuring that scales attached to the system comply with weights and measures regulations.

3663 Supermarket Terminal (cont'd)

8. If a customer wishes to rearrange keytops on the 3663, a device is available to aid him or he may have IBM service do this on a "Time and Material" basis. A device is automatically supplied with every Store Controller.

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement Letter must include the following statement: "It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3663 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations."

When a failure occurs in the cash drawer of any 3663 and it cannot be opened prior to maintenance by IBM, the Customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Maintenance: Agreement for IBM to install and maintain the 3663 must be reviewed by CE country management prior to making any commitment to the customer.

SPECIFY

- Power (AC, 1-phase): Specify one.

50 Hz	60 Hz (Not available on 3663-3P)
110V #2805	115V #9901
123.5V #2811	208V #9902
220V #2813	230V #9904
235V #2814	

- Packaging: Specify #9547 for fully integrated, #9549 for integrated but with remote display. Specify #9548 for distributed; special feature #3425 (Distributed Station) is a prerequisite. Specify one specify code for each 3663 mdl 1 or mdl 1P and one for each 3663 mdl 2; if #9548, feature code #3425 for each 3663 mdl 1, 1P and mdl 2 also. Specify codes need not be the same for all 3663s in a store. Changes in packaging of installed terminals are not permitted in the field.
- Cabling: See cable order form Z120-2516 and refer to *Installation Manual - Physical Planning*, GA27-3079, for the 3660 Supermarket System and *Installation Manual - Physical Planning*, GA27-3167, for the 3650 Programmable Store System.
- Keypad Arrangement: Specify #9353 for a reversed keypad (top row -- 7, 8, 9; middle row -- 4, 5, 6; bottom row -- 1, 2, 3). **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, if installed on one 3663 mdl 1 or 2, it must be installed on all 3663 mdl 1s and 2s in the store. Do not specify if Optional Keyboard (specify code #9488) is ordered. Delete this specify on existing orders pending, if Optional Keyboard (specify code #9488) is to be added. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended.
- Cash Drawer Locks: A separate group of 25 lock numbers has been set aside to allow a customer to use the same key in multiple terminals. If this is desired, specify one of the following locks on the 3663 order:

#9101	#9106	#9111	#9116	#9121
#9102	#9107	#9112	#9117	#9122
#9103	#9108	#9113	#9118	#9123
#9104	#9109	#9114	#9119	#9124
#9105	#9110	#9115	#9120	#9125

If this option is not specified, a lock will be randomly selected from another, larger, group of unique lock numbers.

- Machine Nomenclature (specify one):

Canadian English #2934	French #2928
Canadian French #2935	German #2929
English UK #2927	Italian #2932
English US #2750	Spanish #2931

Note: All 3651 mdl B25, (Canada only) C25, A60, B60, A75, B75, C75 or D75 Store Controllers shipped to countries contain the required graphics for output on 3663s for the following countries:

France	Spanish Speaking
Germany	UK

The graphics not applicable will be selected by the host by means of options and need not be specified here.

- Keyboard Type: One keyboard type must be specified for each 3663 mdl 1, 1P and 2. Specify code #9020 will provide the Regular Keyboard with the 10-key pad positioned on the left. This keyboard may have up to nine department keys. **Limitations:** In the 3660 Supermarket Scanning and Key Entry System, if installed on more than one 3663 in the local or back-up store, all key assignments must be the same. Not compatible with Optional Keyboard (#9488). In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended.

Specify code #9488 will provide the Optional Keyboard with the 10-key pad positioned in the center. The left to right dimension is 16-1/2 inches in the distributed version, special feature code #3425, (no change in the size of the integrated version). An expanded keytop shipping group is included to provide variety in colors, heights and sizes of blank keytops. Also, a means is provided to allow placing single or double sized keys in many locations. **Limitations:** In the 3660 Supermarket Scanning and Key Entry System, this keyboard must be installed on all 3663s in a store and is not compatible with specify code #9020, the Regular Keyboard. All key assignments must be the same. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1 and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended. **Prerequisites:** In the 3660 Scanning System, special feature #3880 is required on all 3663 mdl 1s in the store if any of the following features are installed in the same store: Coin Dispenser Adapters -- #1821, #1822.

SPECIAL FEATURES

Add'l Department Keys (#1059): [Mdl 1, 1P, 2] Provides six additional department keys and a set of 25 prelabeled keytops. **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, if installed on more than one 3663 in the store or backup store, the key assignments for all of the additional keys must be the same. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments.

Storage Expansion Feature (#1580): [Mdl 1P, 3P] Provides the capability of installing storage increments 4 through 9. **Limitations:** This feature now applies only to mdls 1P and 3P that were scheduled for shipment prior to August 1, 1980 and lower than EC level 320637. **Maximum:** One. **Field Installation:** Yes.

Checkout Scanner Adapter Type 2 (#1763): [Mdl 1, 1P] Allows attachment of a 3667 checkout Scanner for operation with the 3663 mdl 1 or 1P to which it is attached. **Limitations:** Cannot be installed when 3663 is attached to the 3661 Store Controller. Cannot be installed when #1761 is installed. **Maximum:** One. **Field Installation:** Yes. Note: For countries that have EAN scan label requirements, see RPQ 7S0250 (EAN/UPC Scanner Adapter) for ordering instructions, prerequisites, and limitations.

2nd Checkout Scanner Adapter Type 2 (#1764): [Mdl 1, 1P] Allows attachment of a 3667 Checkout Scanner for operation with an attached 3663 mdl 2. **Limitations:** Cannot be installed when 3663 is attached to the 3661 Store Controller. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1763, #4900 and the 3663 mdl 2.

Coin Dispenser Adapter Type 2 (#1821): [Mdl 1, 1P, 3P] Allows attachment of an 8-column Coin Dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment Interfaces to the IBM 3663 Supermarket Terminal" document available from Corporate Industry Relations) to any one station of a 3663 mdl 1, 1P or 3P. **Maximum:** One. **Limitation:** Not available if Coin Dispenser Type 1 (#1811) (no longer available) is installed. **Field Installation:** Yes.

2nd Coin Dispenser Adapter Type 2 (#1822): [Mdl 1, 1P, 3P] Allows attachment of a second 8-column Coin Dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment

3663 Supermarket Terminal (cont'd)

Interfaces to the IBM 3663 Supermarket Terminal" document available from Corporate Industry Relations). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1821.

3rd Coin Dispenser Adapter Type 2 (#1823): [Mdl 3P] Allows attachment of a third 8-column coin dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment Interfaces to the IBM 3663 Supermarket Terminal" document available from Corporate Industry Relations). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1821, #1822 and a third mdl 2 attachment (#4901).

Document Insert (#3451): [Mdl 1, 1P, 2] Provides a third location on the printer for printing on an inserted form (refer to 3660 Supermarket Systems Introduction, GA27-3076, for details on forms). **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, if this feature is desired for a mdl 1 on the store loop, it must be installed on the attached mdl 2 (if any) or vice versa. **Maximum:** One on each 3663 mdl 1, 1P or 2. **Field Installation:** Not recommended.

Storage Increment (#3880): [Mdl 1, 1P, 3P] Provides 2,048 additional positions of storage. All replaced parts become the property of IBM. **Limitations:** If this feature is required on one 3663 mdl 1, it must be installed on all 3663 mdl 1s in the store. This feature is only allowed on mdl 1 and on mdl 1P and 3P scheduled for shipment prior to August 1, 1980 and lower than EC level 320637. **Maximum:** One on 3663 mdl 1, nine on mdl 1P and 3P. **Field Installation:** Yes. **Prerequisites:** Installation of more than 3 Storage Increments (mdl 1P and 3P only) requires one Storage Expansion Feature (#1580).

Storage Increment (#4225): [Mdl 1, 1P, 3P] Provides 8,176 bytes of additional storage. **Limitations:** Not compatible with feature #3880 or #1580. This feature is to be used on all mdl 1P and 3P scheduled for shipment subsequent to August 1, 1980 and at EC level 320637 or higher. For mdl 1P and 3P shipped prior to August 1, 1980 an "as required" EC is necessary to allow installation of this feature. **Maximum:** Three. **Field Installation:** Yes.

IML-Read Adapter (#4634): [Mdl 1, 1P, 3P] Provides a means to initialize 3663 terminals when a 3651 Store Controller mdl A25, B25, (Canada only) C25, A75, B75, C75 or D75 is unavailable or unable to provide the IML (Initial Machine Load). An adapter is provided for attaching an external tape cassette recorder (refer to IBM 3650 Retail Store System Introduction Manual, GA27-3075), and reading data previously recorded at a 3651 equipped with the IML-Write Adapter (#4633). **Maximum:** One. **Field Installation:** Yes.

Mdl 2 Attachment (#4900): [Mdl 1, 1P, 3P] Allows attachment of one 3663 mdl 2 to a 3663 mdl 1 or 1P, or allows attachment of a second 3663 mdl 2 to a 3663 mdl 3P. **Maximum:** One. **Field Installation:** Yes. **Note:** The basic 3663 mdl 3P provides for attachment of the first 3663 mdl 2 as a standard feature.

3rd Mdl 2 Attachment (#4901): [Mdl 3P] Allows attachment of the third 3663 mdl 2 to a 3663 mdl 3P. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4900 on 3663 mdl 3P.

Optional Keyboard (#5470): [Mdl 1, 1P, 2] Provides a new keyboard option. The left to right dimension is 16-1/2 inches in the distributed version. (No change in the size of the integrated version). Department keys are placed in a horseshoe fashion around a centrally located numeric keypad. An expanded keytop shipping group is included to provide variety in names, colors, heights and sizes of keytops. Also, a means is provided to allow placing single or double sized keys in many locations. **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, this feature must be installed on all 3663s at a location if the feature is desired on any unit at that location. It is not compatible with the Add'l Department Keys (#1059) feature and a basic keyboard. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended. **Prerequisites:** In the Scanning System, Expanded Capability (#3880) is required on all 3663 Mdl 1s in the store if any of the following features are installed in the same store: Coin Dispenser Adapters (#1821 or #1822).

Receipt Station Half Space (#6226): [Mdl 1, 1P, 2] Vertical spacing in the receipt station is modified to provide half normal vertical spacing, i.e., 10 vertical spaces per inch. The spacing may be manually switched to normal (5 lines per inch). This feature also detects end of label and start of label as well as "End of Forms". Depending on label size, approximately 3-4 labels per minute can be printed. **Limitations:** Only one printer per Control Segment can be used when printing shelf

labels. 3663s attached locally to the 3661 cannot install this feature. **Maximum:** One. **Field Installation:** Yes.

Scale Adapter (#6671): [Mdl 1, 1P, 3P] Allows attachment of an electronic scale (that meets the interface requirements in "Non-IBM Scales Interface to the IBM 3663 Supermarket Terminal" document available from Corporate Industry Relations). **Maximum:** Two on mdl 1 or 1P; three on mdl 3P. **Field Installation:** Yes. **Note:** See Customer Responsibilities **Prerequisites:** For mdl 1P and 3P, the 3650 Programmable Store System Point of Sale Application/Supermarket Environment Program Product (5748-D21) is a mandatory requirement in all states conforming to the National Bureau of Standards Handbook #44 for Weights and Measures. **Prerequisites:** For mdl 1P and 3P, the 3650 Programmable Store System Point of Sale Application/Supermarket Environment Program Product (5748-D21) is a mandatory requirement for certain countries. **Specify:** #9561 if Scale will be used for the station portion of a 3663 mdl 1 or 1P or for the first 3663 mdl 2 attached to a 3663 mdl 3P, or #9562 if it will be used for a 3663 mdl 2 attached to a 3663 mdl 1 or 1P, or for the second 3663 mdl 2 attached to a 3663 mdl 3P, or #9563 if it will be used for the third 3663 mdl 2 attached to a 3663 mdl 3P.

Stand-alone Initial Machine Load (#7555): [Mdl 1, 3] Allows a user-provided tape cassette to be attached to a 3663 Supermarket Terminal mdl 1 to provide IML capability if required when the 3663 is operating in standalone mode. **Maximum:** One.

MODEL CONVERSIONS

Not recommended for field installation except from model 1 to 1P. All replaced parts become the property of IBM.

ACCESSORIES

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

Version	Stem Number/Key Alignment
OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal
-B	Small raised projection in keytop
-C	Circular, concave top on key button
-M	Minimal concavity of circular keytop
Size	Units
Square	1 x 1
Single	1 x 1-1/3
Long	1 x 2
Double	1-1/3 x 2

Engraved Keytops: Keytops containing pre-defined messages are available for use on the 3663 terminal keyboards. Blank keytops are also available for customer engraving. Keytops can be ordered by P/N Specify P/N and quantity.

The following is a list of pre-defined keytops available in the 3660 Supermarket System nomenclature:

UNIVERSAL KEYTOPS: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3663 Supermarket Terminals. These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in four standard sizes and in two heights. They consist of two parts; a white bottom button and a clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with either black or white ink. The user may define unique key button messages, print these messages on the desired color label, affix the printed color label to the white bottom key button and snap on the clear protective cover. Extra clear plastic covers are also available for use as spares.

Accessories can be ordered by P/N. Specify P/N and quantity.

Key Stops (P/N 1650058): Specify P/N and quantity.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device that fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard. Two keytop extractors are supplied with each 3651 controller. If the customer desires additional extractors, they may be ordered by P/N

Locks and Keys: The 3663 Stations are equipped with three locks and a complement of keys as follows:

- Cash Drawer Lock -- different for each station unless specified otherwise. The Cash Drawer Keylock is shipped with two keys as standard.
- Till Cover Lock -- One standard key fits all tills. One key shipped as standard per till.

IBM Canada Ltd.

MACHINES

M 3663.7
Jan 85
Major Revision

3663 Supermarket Terminal (cont'd)

- Summary Journal Lock -- One standard key fits all summary journals. One key shipped as standard per summary journal.

Additional or replacement keys may be purchased from IBM or a local locksmith. Cash Drawer Lock Key blank part numbers are listed below if the customer requires key blanks and/or for replacement keys if ordered from IBM. Locks may be changed in the field. A customer authorization letter with key identification number (stamped on key and lock) must accompany the order. If the customer does not specify a specific key number, a new lock with keys will be selected randomly. Allow 6 to 7 weeks for shipment. Note: To order extra keys, specify machine serial number and the key identification number being replaced. Without a key identification number, a new lock must be ordered, with the words "NEW LOCK REQUIRED".

3663 Cash Drawer Key - Specify: Machine serial number, key identification number, machine type, lock serial number, and key P/N from the following chart:

Lock Serial Number	Lock Key P/N
H2601 - H2800	8549431
H2801 - H3000	8549482
H3001 - H3200	6021144
H3201 - H3400	6021145

** 3663 Cash Drawer Keylock with 2 keys (random selection) - P/N 1851086 *, 3663 Summary Journal Lock (with 2 keys) - P/N 1851371 *.

*Specify: Machine serial number and the key identification number being replaced.

Tills: The 3663 Supermarket terminal stations are equipped with a removable till and locking cover. Additional tills with locking covers may be ordered. Specify P/N and quantity. See 3663 Till Cover Key under "Locks and Keys".

** 3663 Till P/N 1851138, (Canada only -> 3663 Till with Fixed Bill Slots P/N 1851117. ->)

SUPPLIES

Ribbons: A black ribbon, P/N 1136970, or equivalent, is recommended; should be used for machines installed prior to June, 1975. Machines installed after this date and those machines previously installed that are changed to the new ribbon drive mechanism should use P/N 1136660 or equivalent. Contact IBM. See 3660 Supermarket System Introduction, GA27-3076, for roll paper and Document Insert forms specifications.

3667 CHECKOUT SCANNER

PURPOSE

Fixed-head optical reader for the 3650 Programmable Store System and the 3660 Supermarket System. The 3667 is 71.1cm (28 inches) high and it is particularly adaptable to:

- Checker unload mode of checkout
- Seated checker operation

MODELS

Model 1 001 Checkout Scanner

HIGHLIGHTS

When used with the 3650 Programmable Store System, can also read industry standard European Article Numbering (EAN-13) symbols. (When used with the 3650 Programmable Store System, interpretation of all symbols is done by the user application program.)

A fixed head scanner designed to be placed in the checkstand so that greater accuracy and productivity may be achieved. One scanner may be operated with each station; both scanner adapters are located on the 3663 mdl 1/1P.

The scanner contains a laser system which complies with the safety standards proposed by the United States Department of Health, Education and Welfare (Proposed Performance Standard for Laser Products, March 6, 1973 - Class 1, 21 CFR 278) and with ANSI and ACGIH proposed standards.

The scanner reads the new Universal Product Code symbol (Version A & E), announced by the USA Uniform Grocery Product Code Council or the European EAN Universal Product Code via RPQ 7S0250 on the 3663.

Alternate product codes, which may result from national and/or international harmonization efforts, will be addressed by IBM following adoption and publication of the corresponding agreed specifications.

Prerequisites: If the 3667 is to operate with a 3663 mdl 1 or 1P, the 3663 mdl 1 or 1P requires Checkout Scanner Adapter Type 2 (#1763).

If the 3667 is to operate with a 3663 mdl 2, the 3663 mdl 1 to which that 3663 mdl 2 is attached requires Checkout Scanner Adapter Type 2 (#1763) and 2nd Checkout Scanner Adapter Type 2 (#1764).

Customer Responsibilities: See "Customer Responsibilities" section in M3663 pages.

Refer to *Installation Manual - Physical Planning for the 3660 System* for correct ambient light intensity requirements.

A number of countries presently have adopted, and others are considering the adoption of regulations governing the use of laser products. Users should determine the extent of regulation in their countries. The customer is responsible for providing the remaining checkstand furniture components and their maintenance. Window replacement is a customer responsibility.

The 3667 Scanner must be mechanically restrained in its final mounted position. During maintenance, the 3667 can be tipped forward by a downward force in the extended components drawer. The customer must provide this restraint. Unless the 3667 is restrained from tipping by the geometry of the checkstand, an IBM-provided Safety Clip or Safety Bracket must be ordered for each 3667. It is the responsibility of the customer to locate and install the restraining hardware (see "Specify").

Copies of the UPC Symbol Specifications and the UPC Guidelines are available at a charge from the UPC Council. Write to:

Uniform Product Code Council, Inc.
7061 Corporate Way, Suite 106
Dayton, Ohio 45459
513-435-3870

For copies of the General Specifications for the Article Symbol Marking (EAN) write to:

Secretary General E.A.N.
Rue Des Colonies 54, Bte 8
1000 Bruxelles - Belgique

SPECIFY

- Machine Nomenclature (specify one):

Australian #2918	French #2928
Canadian English #2934	German #2928
Canadian French #2935	Italian #2932
English UK #2927	Spanish #2931

If none of the above is specified, English US will be supplied.

- **Cable Requirements:** See M3663 pages.

- **Packaging/Labels:** Certain countries require special packaging and/or labels to be legally in compliance with the current regulations. Machines installed in these countries must have the appropriate specify code:

Canada* **#2934 or #2935**

*Nomenclature Specify Code above provides the additional required items.

- **Scan Direction:** Specify **#9604** for Normal Scan Direction. This is typically used for Over the Counter (OTC) operation, sometimes referred to as checker unload.

Optional Scan Direction: Specify **#9605** for optional scan direction. This is typically used for Over the End (OTE) operation, sometimes referred to as customer unload.

See *IBM 3650 Programmable Store System Installation Manual - Physical Planning*, GA27-3167, or *IBM 3600 Supermarket Systems; Installation Manual - Physical Planning*, GA27-3079, for illustration of scan direction options.

- **Item Sensor Position:** Prior to the availability of specify **#9301** and **#9302**, the item sensors were shipped in the low position.

Specify: #9301 for Item Sensor-High Position. This position may be desired with specify **#9604** (Normal Scan Direction). (Caution: Small flat items may not be sensed in this position causing re-scans or possibly missed items. Contact your Market Support Center for more information.)

Specify: #9302 for Item Sensor-Low Position. This position may be desired with Specify **#9605** (Optional Scan Direction).

- **Restraining Hardware:** See *3660 System Installation Manual - Physical Planning*, GA27-3079, to determine type of restraining hardware desired. Order one of the following for each 3667 to be installed:

- 1) Safety Clip - for each 3667, order (1) B/M **5194716** to secure one rear 3667 leg to the customers' stationary horizontal mounting surface, or
- 2) Safety Bracket - for each 3667, order (1) B/M **5194758** to secure the 3667 lower rear cabinet extension to the customers' stationary vertical checkstand surface.

Order the Safety Clip or Safety Bracket on MES. This is a no-charge item to the customer and a quantity sufficient for three months' installation may be submitted on a single MES order for a given customer.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Window (P/N 5563123): The 3667 Checkout Scanner is equipped with a replaceable window. With use, it will tend to get scratched and need to be replaced periodically. Window replacement is a customer responsibility. Specify P/N and quantity.

3669 STORE COMMUNICATION UNIT

PURPOSE

To provide communications for the 3650 Programmable Store System and the 3660 Supermarket System over PTT-supplied facilities between a 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 and:

- The host S/370, 30XX or 4300 Processor (3669 mdl 2 only) via a 3872 Modem, 2400 bps Integrated Modem or a PTT mandatory modem attached to a 3704, 3705 or 3725 Communications Controller with switched line features, or a Communications Adapter (#1601) feature on the 4331.
- The store loops at another predesignated store location via another 3669 at that location, to provide backup operation for that store in case its 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 is inoperative.
- The 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 in the predesignated store via the 3669 in that store for the purpose of data reconciliation when the backup operation is terminated. If both Store Controllers are 3650 mdl 75, communication can also be performed for purposes other than backup data reconciliation.
- The host 4341, 4361, 4381, 303X or 3090 processor via a 3872 Modem or a PTT mandatory modem attached to a 3720 Communication Controller and operating over switched lines.

In Australia and New Zealand, host communications will be handled at 600/1200 bps on switched lines using the Datel Switched Service Plan 32E or Post Office Datel 600 Switched Service.

The 3669 mdl 3 is designed to provide communications between two predesignated store locations over a nonswitched, 2-wire, half-duplex or 4-wire duplex, point-to-point line. It must be used in countries which do not require mandatory modems over the non-switched telephone network. For countries that require mandatory PTT modems, RPQ 7B0211 must be ordered. It requires a voice-grade telephone line facility of normal quality. For 4800 bps transmission speed, RPQ ZB7983 must be ordered. See your TP Coordinator for local availability of this facility.

MODELS

Model 3 003: Nonswitched Network

Prerequisites: A 3650 Programmable Store System or a 3660 Supermarket System (equipped with a 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75). An appropriate communications facility and attachment arrangement (see M2700 pages). A store loop equipped with at least one 3663 Supermarket Terminal mdl 1 or 1P. Communications with any virtual storage S/370, 30XX or 4300 processor (4331, 4341, 4361, 4381, 3033, 3033MP, 3158MP, 3168, 3168MP VTAM only), (165II BTAM only) or 3081 via the 3704, 3705 or 3725, or an ICA (BTAM only) on a S/370 mdl 115, 125, 135, 135-3 or 138 or a Communications Adapter (#1601) feature on a 4331 or 4361. Communications with any virtual storage 4341, 4361, 4381, 303X, 308X, or 3090 processor (VTAM only) via the 3720 Communication Controller.

HIGHLIGHTS

The 3669 is a synchronous signal converter designed to connect, under switched control, either a 3651 Store Controller mdl A60, B60, A75, C75 or D75 or two store loops to the PTT-supplied communications network. Diagnostic test functions are normally under control of the 3651 mdl A60, B60, A75, B75, C75 or D75 during initial power on. An additional switch setting allows the performance of manual diagnostic test. Auto answer is included as a standard feature.

Attachment: One cable is provided to interface to the store loop. One cable is provided to attach to the Communications line on a mdl 3.

Customer Responsibilities: (1) See M2700 pages ... (2) Customer is responsible for obtaining, installing, and testing the store loops. See "Installation Manual - Physical Planning" (GA27-3079) for the 3660 Supermarket System.

SPECIFY

- Power (AC, 1-phase):

50 Hz		60 Hz	
110V	#2805	100V	#2730
123.5V	#2811	115V	#9901
200V	#2806	200V	#2732
220V	#2813	208V	#9902
235V	#2814	230V	#9904

- Machine Nomenclature (specify one):

English US	#2750	German	#2929
English UK	#2927	Spanish	#2931
French	#2928	Italian	#2932

SPECIAL FEATURES

Direct Line Attachment (#2939): Available in some countries to meet PTT specifications to have the 3669 homologated. Consult your Teleprocessing Coordinator to determine if whether it is required. Maximum: One. Field Installation: Yes.

RPQS

PTT (RPQ 7B0211): Mandatory Interface on 3669 Store Communication Unit.

Note: RPQ 7B0211 interfaces with mandatory PTT modems at 2400 bps. It can be used with dual communications adapter for leased backup connections or with single communications adapter for switched backup on host connection.

RPQ ZB7983 - 4800 BPS transmission speed on 3669 Model 3.

(Canada only > RPQ 8Q0129: Cable - Modem to Protective Coupler (DAA). This RPQ provides a 3669 modem cable equipped with a "quick-disconnect" plug type connector. This type connector is required for use on the Protective Coupler P/N 1649100 available from IBM. If the RPQ cable is not ordered, the 3669 will be shipped with a modem cable equipped with eight spade-lugs for use on screw terminal type connectors provided on some Protective Couplers not available from IBM. <)

3683 POINT OF SALE TERMINAL

PURPOSE

A user-programmable input/output terminal for the 3650 Programmable Store System or the 3680 Programmable Store System which provides the point of sale transaction, data collection, credit authorization, price look-up and other inquiry and data entry functions. The self contained programmable segment allows the 3683 to continue most sales functions when disconnected from the 3651 Store Controller or the 3684 Point of Sale Control Unit, and after receiving a program load from the 3651 or the 3684.

MODELS

A description of each available model of the 3683 is as follows:

Model 1 001: Comprised of a base unit with 32K bytes of base storage and an integrated printer. The cash receipt station is standard. Additional print stations, journal, validation or label printer may be added as features for a maximum of three print stations.

Model 1A A01: Same as the 3683 model 1 except that the 3683 model 1A has 56K bytes of base storage and provides for the attachment of a 3687 Checkout Scanner. Limitations: Cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), Storage Increment-8K (#7710), Storage Increment-24K (#7730) or Expansion Feature I (#3880).

Model 2 002: Comprised of a base unit with 56K bytes of base storage and a 1- or 2-station distributed printer. The printer is contained in a separate set of covers cable connected to the base unit. The cable length is 3.6m (12 ft.). The cash receipt station is standard. Only the journal print station may be added to allow for a maximum configuration of two print stations. All other I/O (cash drawer, displays or keyboards) must be distributed or remote when used with this unit. Limitations: Cannot install Label Printer (#8726), Validation Printer (#8725), Integrated Cash Drawers (#1571 and #1573), Storage Increment-8K (#7710), or Storage Increment-24K (#7730).

Model 2A A02: Same as the 3683 model 2 except that the 3683 model 2A enables attachment of a 3687 scanner. Limitations: In addition to those listed under 3683 model 2, cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), or Expansion Feature I (#3880).

Model 3 003: Comprised of a base unit with 56K bytes of base storage and a 1-, 2-, or 3-station distributed printer. The printer is contained in a separate set of covers cable connected to the base unit. The cable length is 3.6m (12 ft.). The cash receipt station is standard. Additional print stations, journal, validation or label printer may be added as features for a maximum configuration of three print stations. All other I/O (cash drawers, displays or keyboards) must be distributed or remote when used with this unit. Limitations: Cannot install Integrated Cash Drawers (#1571 or 1573), Storage Increment- 8K (#7710) or Storage Increment- 24K (#7730).

Model 3A A03: Same as the 3683 model 3 except that the 3683 model 3A provides for the attachment of a 3687 Scanner. Limitations: In addition to those listed under 3683 model 3 cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), or Expansion Feature-1 (#3880).

Limitations: On 3683 mdls 1, 2 or 3, when six of the following features are installed, Storage Retention (#7785) is required.

IML Read Adapter	#4633
Magnetic Wand Reader	#4945*
Non-IBM EAN/UPC Wand Attachment	#4946*
Non-IBM OCR Hand-Held Reader Adapter	#5422*
Non-IBM Coin Dispenser Adapter	#5431
Non-IBM Scale Adapter	#5433
Storage Expansion-POS	#6991
Totals Retention	#8010

* mutually exclusive

3683 mdls 1A, 2A or 3A will allow up to a maximum of three of the following features to be installed in the base unit before Expansion Feature-II (#3881) is required. When the features are installed, the sum of the unit values should not exceed 3. When the unit value exceeds 3 or if Storage Expansion-POS (#6991) is required, then Expansion Feature-II (#3881) must be installed.

Feature	Unit/Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
IML Read Adapter (#4633)	1

Prerequisites: 1) A 3651 Store Controller mdl 25 or 75 or 3684 Point of Sale Control Unit model 2 provides the control segment for the 3683. See M3651 or 3684 pages for details. 2) A keyboard, #2712 or #2713, and a display, #3331, #3332, #3346, or #3348 must be ordered for each 3683. If a 3683 mdl 2, 2A, 3 or 3A is ordered, a distributed display (#3335 or #3338) or a remote display (#3333 or #3337) are the only type of display that can be attached. A distributed keyboard attached by Distributed Keyboard Attachment (#3240) is the only keyboard that can be attached, and if a cash drawer is attached, it can only be attached by Cash Drawer -- Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577).

Customer Responsibilities: See S3650 and 3680 pages for general description of customer responsibilities.

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgment Letter must include the following statement:

"It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3683 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations.

When a failure occurs in the cash drawer of any 3683, and it cannot be opened prior to maintenance by IBM, the customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Customer Setup: The 3683 will be shipped with customer setup instructions. The customer is responsible for:

- Unpacking, placement, set up and checkout of the 3683 at time of delivery, or when relocating the 3683.
- Relocation of the 3683 (if required) to allow IBM service access.
- Using and following the 3683 Problem Determination Procedures.

Maintenance: 3683s located in the immediate sales area may preclude the customer acceptability of online repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the failing terminal to a repair facility located within the store for subsequent repair. At this location the CE will repair and test the terminal online via a customer-provided store loop termination.

HIGHLIGHTS

A modular input/output unit with features and mdls that provide for an integrated or distributed terminal. It features data entry by keyboard or from a Magnetic, non-IBM EAN/UPC or a non-IBM OCR Hand-Held Reader or from a 3687 Checkout Scanner and data output via an 8-digit numeric display, with up to 32 indicators for operator guidance and machine status conditions, or an alphameric display with 36 character positions and printing of data under program control. The minimum configuration must include a base unit plus a Keyboard and a Display (see "Prerequisites"). The 3684 mdl 2, as well as the 3651 mdl 25 or 75, is capable of transmitting or receiving data with several 3683s over a 2400 bps loop. The 3651 mdl 75 and the 3684 mdl 2 are capable of transmitting or receiving data with several 3683s, all mdls, over a 4800 bps loop. Separate printer-based mdls (2, 2A, 3, and 3A) of the 3683 are available to provide the ability to distribute the printer from the bases unit. All I/O devices (cash drawers, displays, keyboards) must be distributed when these mdls are designated.

Base Unit: Provides (1) the base electronic storage and intelligence and an audible alarm; and, (2) a matrix printer with cash receipt station. Basic storage for the 3683 mdl 1 is 32K bytes. This can be increased to 56K bytes by Storage Increment features and to 120K bytes via the Storage Expansion feature. The base storage for the 3683 mdls 1A, 2, 2A, 3 and 3A is 56K bytes. They also can be increased to 120K bytes via the Storage Expansion feature. An audible alarm, activated when system operation, is also part of the base unit.

Printer: A matrix, bidirectional printer which prints a 38-character print line at 15 characters per 25.4mm (inch) spacing. Vertical spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. It uses an easily replaceable cartridge ribbon. In addition to the standard character sets, an all-points addressable capability allows (by customer programming) printing of customer logo and special graphics including Kanji. Additional print stations can be ordered as features. The cash receipt station will accept 88.9mm (3.5 in.) diameter roll paper, 69.85mm (2.75 in.) wide.

Storage Increments: When storage on a 3683 mdl 1 is upgraded from 40K to 48K or to 56K by field installation, the new Storage Increment feature displaces the old. Removed parts belong to the customer. Prior to using a removed module in another 3683 the compatibility of the part should be verified and an RPQ must be submitted to allow reinstallation on another machine.

SPECIFY

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	120V #2800
200V #2806	
220V #2813	
230V #2821	
240V #2801	

Note: A 2.8m (9 ft) power cord and plug will be shipped with each machine from the plant of manufacture. The country code will be used to select a power cord and plug to the specifications most commonly used in that country.

Specify #2710 for power cord without a plug.

For Canada only, specify #9890 for locking plug or #9891 for non-locking plug (both at 60 Hz, 120 Volts, 1-phase).

For Japan only, specify #9890 for locking plug or #9881 for non-locking plug (for either 50 Hz or 60 Hz, 100 volts, 1-phase).

Note: 120V AC, 60 Hz is compatible with existing 115V systems.

- Machine Nomenclature:

Canadian English #2934
Canadian French #2935
English US #2950
Japanese #2930
Spanish #2931

- Loop Speed: Specify #9420 for 2400 bps loop speed or #9430 for 4800 bps loop speed.
- Controller Designation: Specify #9493 on the 3651 controller for 3683 control code if 3683 terminals are attached to the 3651 controller and if a 3680 system is not attached to the same host system. See "Specify" in M3651 pages.

SPECIAL FEATURES

Cash Drawer-Integrated-First (#1571): (Mdls 1, 1A) Provides a cash drawer with housing with removable till that is integrated with the 3683 base unit. The cash drawer has a media slot that will accommodate approximately a 25mm (1in.) stack of documents. Opening the cash drawer is under program control. A cash drawer lock is provided. See note below for special ordering instructions for lock and removable bill dividers. Maximum: One. Limitations: Only one additional cash drawer may be ordered - either Cash Drawer Integrated-Second (#1573), Cash Drawer Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577). Field Installation: Yes.

Cash Drawer-Integrated-Second (#1573): (Mdls 1, 1A) Provides a second Integrated Cash Drawer with housing and removable till that is installed directly below Cash Drawer-Integrated-First (#1571). Functionally equivalent to Cash Drawer-Integrated-First (#1571). Maximum: One. Prerequisites: #1571. Field Installation: Yes.

Cash Drawer-Distributed (#1575): Provides a distributed cash drawer with housing and removable till that can be located up to 3.6m (12 ft) from the 3683 base. Functionally equivalent to Cash Drawer-Integrated-First (#1571). Maximum: Two, if no other drawer is ordered. One, if Cash Drawer Integrated-First (#1571) or non-IBM Cash Drawer Attachment (#1577) is ordered. Field Installation: Yes.

Non-IBM Cash Drawer Attachment (#1577): Provides an IBM-defined interface with cable and other plug for attaching a non-IBM Cash Drawer. Maximum: Two, if no IBM Cash Drawer is ordered. One, if a Cash Drawer Integrated-First (#1571) or Cash Drawer Distributed (#1575) is ordered. Limitations: An attached non-IBM Cash Drawer must meet the IBM-defined interface as stated in the IBM 3680 PSS Cash Drawer Attachment (FC #1577) Product Attachment Information available from Industry Relations. Field Installation: Yes.

Notes:

- For cash drawer tills and covers, see "Accessories".
- Specify #9799 for each IBM cash drawer ordered (#1571, #1573 or #1575) if a till with movable bill dividers is desired.
- Cash Drawer Lock: Each IBM cash drawer (#1571, #1573 or #1575) is equipped with a lock. A group of 25 unique lock numbers has been reserved to allow a customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following features on the cash drawer order:

#9101	#9106	#9111	#9116	#9121
#9102	#9107	#9112	#9117	#9122
#9103	#9108	#9113	#9118	#9123
#9104	#9109	#9114	#9119	#9124
#9105	#9110	#9115	#9120	#9125

If none is specified, a lock will be selected at random from a larger group of lock types. Each cash drawer will be shipped with two cash drawer keys.

Distributed Keyboard Attachment (#3240): Provides for locating the keyboard up to 3.6m (12 ft) from the 3683 base. Prerequisites: #2712 or #2713. Maximum: One. Field Installation: Yes.

Display, One-Sided (#3331): An operator display and guidance unit consisting of an 8-digit numeric display and 32 indicators for operator guidance and machine status. The display is used to display numeric input or output data such as item number, totals, amount due, etc. The 32 indicator lights point to labels that describe machine status or guidance. The unit will be shipped with the indicators labeled to correspond to the country language specified. However, the customer may re-label all but five indicators and, under customer program control, define their use. A legend sheet, with a variety of legends, will be shipped with each machine. Maximum: One. Limitations: Cannot be ordered with Display-Two Sided (#3332), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Display, Two-Sided (#3332): An operator and customer display guidance unit which contains all the functions of Display, One-Sided (#3331) plus an 8-digit numeric display with 6 indicators on the back of the unit for customer viewing. Maximum: One. Limitations: Cannot be installed with Display-One Sided (#3331), Display-Customer Remote (#3333), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Display-Customer Remote (#3333): A customer display and status indicator unit that is connected to the 3683 by a 3.6m (12 ft) cable. The unit consists of an 8-digit numeric display and 12 indicators (6 are shipped with labels and 6 without). All are re-legenable. The display and indicators are under customer program control. Maximum: One. Prerequisites: #3331. Limitations: Cannot be installed with the Display-Two Sided (#3332), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Distributed Display Attachment (#3335): Provides for distributing Display-One Sided (#3331) or Display-Two Sided (#3332) up to 3.6m (12 ft) from the 3683 base. Maximum: One. Prerequisites: #3331 or #3332. Limitations: Cannot be installed with Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Alphameric Display (#3336) (NO LONGER AVAILABLE): An operator/customer display consisting of two rows of 18 characters, each for a total of 36 characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3683. Maximum: One. Limitations: Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Remote Second Alphameric Display (#3337) (NO LONGER AVAILABLE): A customer display that is connected to the 3683 by a 3.6m (12 ft) cable. The display consists of two rows of 18 characters each, for a total of 36 characters and is used to display numeric as well as alphabetic data such as item number, description, etc. Maximum: One. Prerequisites: #3336. Limitations: Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Distributed Alphameric Display Attachment (#3338) (NO LONGER AVAILABLE): Provides for distributing the Alphameric Display (#3336) up to 3.6m (12 ft) from the 3683 base. Maximum: One. Prerequisites: #3336. Limitations: Cannot be installed with numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Alphameric Display, Type II (#3346): An operator/customer display consisting of two rows of 18 characters each for a total of 36 characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3683. Maximum: One. Limitations: Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335) or with Alphameric Display (#3336 or #3337). Field Installation: Yes.

Distributed Alphameric Display, Type II, Attachment (#3348): Provides for distributing the Alphameric Display, Type II (#3346) up to 3.6m (12 ft) from the 3683 base. Maximum: One. Prerequisites: #3346. Limitations: Cannot be installed with a numeric display

(#3331, #3332, #3333 or #3335) or with an Alphameric Display (#3336 or #3337). Field Installation: Yes.

Expansion Feature-I (#3880): (Mdl 1, 2, 3) Provides facilities to accommodate additional features that cannot be installed on the base unit. Prerequisites: On 3683 mdls 1, 2 or 3, this feature is a prerequisite to install any of the following: IML Read Adapter (#4633), Magnetic Wand Reader (#4945), Non-IBM EAN/UPC Wand Attachment (#4946), Non-IBM OCR Hand-Held Reader Adapter (#5422), Non-IBM Coin Dispenser Adapter (#5431), Non-IBM Scale Adapter (#5433). Maximum: One. Limitations: Cannot be installed with Expansion Feature-II (#3881) or with Storage Expansion-POS (#6991). This feature will allow installation of up to a maximum of four of the following features. When the features are installed the sum of the unit values should not exceed 4. Field Installation: Yes.

Feature	Unit/Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
*Non-IBM OCR Hand-Held Reader Adapter (#5422)	1
*Magnetic Wand Reader (#4945)	1
IML Read Adapter (#4633)	1
*Non-IBM EAN/UPC Wand Attachment (#4946)	2

* mutually exclusive

Expansion Feature-II (#3881): Provides expanded facilities on the 3683 to permit installation of features not accommodated by the base unit (all mdls) or by the addition of Expansion Feature I (#3880) on 3683 mdls 1, 2 or 3. Prerequisites: This feature is a prerequisite to install Storage Expansion-POS (#6991) and displaces Expansion Feature-I (#3880), if installed on 3683 mdls 1, 2 or 3. This feature is a prerequisite if both the non-IBM EAN/UPC Wand Attachment (#4946) and the IML Read Adapter (#4633) are to be installed. Limitations: Cannot be installed with Expansion Feature-I (#3880). Maximum: One. Field Installation: Yes.

IML Read Adapter (#4633): Provides a means to initialize 3683 terminals when a 3684 mdl 2 is unavailable or unable to provide the IML (Initial Machine Load), or provides a means to initialize 3683, 3653 mdls 1 (EC 349653 or higher is prerequisite) and IP, or 3663 mdls IP and 3P terminals when a 3651 Store Controller mdl 25 or 75 with a 3683 attached to its loop is unavailable or unable to provide the IML. An adapter is provided for attaching an external user-provided tape cassette recorder and reading data previously recorded at a 3684 mdl 2 with the IML Write Adapter (#4634), or at a 3651 mdl 25 or 75 with the IML Write Adapter (#4633). (Refer to "IBM 3680 Planning and Site Preparation Guide", GA27-3213, for cassette recorder interface requirement.) Prerequisites: On 3683 mdls 1, 2 or 3, #3880 or #3881 is a prerequisite to this feature if the non-IBM EAN/UPC Wand Attachment (#4946) is installed. Maximum: One. Field Installation: Yes.

Journal Lock (#4690): Provides a special lock and security cover over the printed journal. See note below for special lock selections. Maximum: One. Prerequisites: #4695. Field Installation: Yes.

Journal Printer (#4695): Provides a journal print station with a journal roll take-up mechanism. Print line length is 38 characters at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer permit the customer to highlight exceptions through special graphics designed and controlled by user programming. A 12.7mm (0.5 in.) signature window is provided. The journal station will accept 88.9mm (3.5 in.) diameter roll paper, 69.85mm (2.75 in.) wide. Maximum: One. Field Installation: Yes.

Manager Keylock (#4905): Provides a keylock mounted on the keyboard that allows customer programming to interrogate the position of the keylock when the key is operated. Possible uses include the enforcement of a manager override to a restricted security function.

See note below for special lock selection. Maximum: One. Prerequisites: #2712 or #2713. Field Installation: Yes.

Note: Two groups of ten unique specify numbers have been reserved to allow a customer to order a specific journal lock or manager keylock for each terminal. (The 3683 and 3684 use the same journal lock and manager keylock numbers, therefore all terminals within a store could have the same lock if desired.) If the same lock is desired on the journal and manager keylock, specify the respective locks with the same value in the last digit. That is, if #9203 and #9303 are specified, the same lock (#9203) will be installed at both locations.

Journal Lock Manager Keylock

#9201	#9301
#9202	#9302
#9203	#9303
#9204	#9304
#9205	#9305
#9206	#9306
#9207	#9307
#9208	#9308
#9209	#9309
#9210	#9310

If none is specified, a lock will be selected at random from a larger group of lock types. Each lock feature will be shipped with two keys. For additional or replacement keys, see "Accessories".

Keyboards, General: All keyboards have customer legendable keybuttons except for 11 keybuttons which have molded legends. All single and double function keys are under customer program control. Double keys may be moved, added or deleted by the user. Several colors and sizes of decal sheets with common legends by country language will be shipped with the 3683. See "Accessories" for released keybuttons that may be ordered for any unique customer requirement. Maximum: One keyboard (#2712 or #2713). Field Installation: Yes.

35-Key Modifiable Keyboard (#2712): A 35-key keyboard that includes:

- 5 Legended system function keys.
- 19 Unlegended function keys.
- 11 Keys with round, numeric legended keybuttons in the data entry arrangement.

48-Key Modifiable Keyboard (#2713): A 48-key keyboard that includes:

- 5 Legended system function keys.
- 32 Unlegended function keys.
- 11 Keys with round, numeric legended keybuttons in the data entry arrangement.

Magnetic Wand Reader (#4945): (Mdl 1, 2, 3) A hand operated wand used to read single track delta distance encoded magnetic merchandise tickets, credit cards, employee badges, etc. The small lightweight wand attached via a 1.2 meter (4 foot) long, flexible cord allows encoded merchandise tickets to be read without removing them from the merchandise. See note. Prerequisites: On 3683 mdls 1, 2 or 3, #3880 or #3881. Limitations: Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a non-IBM OCR Hand-Held Reader Adapter (#5422). Maximum: One. Field Installation: Yes.

Note: The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request from Industry Relations.

Non-IBM EAN/UPC Wand Attachment (#4946): (Mdl 1, 2, 3) Provides an adapter to support the attachment of a non-IBM EAN/UPC Bar Code hand-held wand reader. This feature provides an external connector to attach the non-IBM wand reader. The types of wand readers that can attach to this feature are either analog output wand readers (Intermec 1233R or equivalent) or digital output wand readers (Hewlett-Packard HEDS 3000 or equivalent) that meet the requirements stated in the Non-IBM EAN/UPC Wand Reader Attachment, Product Attachment Information for the 3650/3680 document which is available from Industry Relations/Product Information Corporate Headquarters Armonk. Prerequisites: On the 3683 Mdl 1, 2 or 3 Expansion Feature #3880 or #3881. Also on the 3683 Mdl 1, 2 or 3 Expansion Feature II (#3881) is a prerequisite to this feature if the IML Read Adapter (#4633) is installed. The IBM Multiple Supplier Systems Bulletin, GI20-6648, applies to the non-IBM wand reader. Limitations: When this attachment is used with an analog output wand reader, it is possible that this feature may experience failures if operated within five miles of a high power AM transmitter of the type used for television broadcasting. Cannot be installed with the Magnetic Wand Reader (#4945) or non-IBM OCR Hand Held Reader Adapter (#5422). Maximum: One. Field Installation: Yes. Specify: #9660 for analog wand interface or #9661 for digital wand interface.

Non-IBM OCR Hand-Held Reader Adapter (#5422): (Mdl 1, 2, 3) Provides an adapter to support the attachment of an IBM 3687 Mdl 2 Checkout Scanner or a non-IBM OCR hand-held wand reader that meets the requirements stated in the IBM Retail System OCR A/B Wand Reader Product Attachment Information document which is available from Industry Relations. This feature provides a 1.83 meter (6 foot) cable with an ITT--Cannon DBC-25S type connector to attach the IBM 3687 Mdl 2 or the non-IBM OCR Hand-Held Reader unit. Prerequisites: On 3683 Mdl 1, 2 or 3, #3880 or #3881. Limitations: Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a Magnetic Wand Reader (#4945). Maximum: One. Field Installation: Yes.

Non-IBM Coin Dispenser Adapter (#5431): Provides an IBM-defined serial interface for attaching a non-IBM-manufactured coin dispenser that meets the requirements stated in the "IBM 3680 PSS System non-IBM Coin Dispenser Adapter Product Attachment Information" document which is available from Industry Relations. For further information on the attachment, refer to the Market Support Center. Prerequisites: On 3683 mdls 1, 2 or 3, #3880 or #3881. There is no prerequisite feature on a 3683 mdl 1A, 2A or 3A. Maximum: One. Field Installation: Yes.

Non-IBM Scale Adapter (#5433): Provides an IBM defined serial or parallel interface for attaching a non-IBM manufactured scale that meets the requirements stated in the "IBM 3680 PSS System non-IBM Scale Adapter Product Attachment Information" document which is available from Industry Relations. For further information on the attachment, refer to the Market Support Center. Specify: #9385 if Serial Interface is to be installed; #9386 if Parallel Interface is to be installed. On Parallel Interface also specify #9387 if scale is a 10kg Metric scale. On Serial Interface specify #9388 if scale is a 5-digit scale. Otherwise, scale is assumed to be a 4-digit scale. Prerequisites: On 3683 mdls 1, 2 or 3, #3880 or #3881. There is no prerequisite feature on a 3683 mdl 1A, 2A or 3A. Maximum: One. Field Installation: Yes.

Storage Expansion-POS (#6991): Provides the capability for expanding the storage capacity of a 3683 from a maximum of 56K to a maximum of 120K bytes. This feature permits installation of up to four 16K Storage Increments (#7720) on 3683s. Prerequisites: Expansion Feature II (#3881) must be installed. In addition, the 3683 mdl 1 must have Storage Increment -- 24K (#7730) installed. Maximum: One. Field Installation: Yes.

3683 MDL 1 STORAGE CONFIGURATOR

32K	Base Storage
40K	8K - #7710, or
48K	16K - #7720, or
56K	24K - #7730

	Expansion Feature II - #3881

	Storage Expansion-POS-#6991 (#7730 and #3881 are prerequisites)
72K	16K - #7720
88K	16K - #7720 (2)
104K	16K - #7720 (3)
120K	16K - #7720 (4)

3683 MDL 1A, 2, 2A, 3, OR 3A STORAGE CONFIGURATOR

56K	Base Storage

	Expansion Feature II - #3881

	Storage Expansion-POS-#6991 (#3881 is a prerequisite)
72K	16K - #7720
88K	16K - #7720 (2)
104K	16K - #7720 (3)
120K	16K - #7720 (4)

Storage Increment--8K (#7710): (Mdl 1) Provides an additional 8,192 bytes of storage. Maximum: One. Limitations: Cannot be installed with Storage Increments--16K (#7720) or Storage Increment--24K (#7730) or on a 3683 mdl 1A, 2, 2A, 3 or 3A. Field Installation: Yes.

Storage Increment--16K (#7720): Provides an additional 16,384 bytes of storage. Maximum: One, if Storage Expansion-POS (#6991) is not installed; four, if Storage Expansion-POS (#6991) is installed. Limitations: Cannot be installed with Storage Increment--8K (#7710) or 24K (#7730) or on the 3683 mdls 1A, 2, 2A, 3 or 3A unless Storage Expansion-POS (#6991) is installed. Field Installation: Yes. Note: If Storage Increment--8K (#7710) is installed, it must be removed to install this feature.

Storage Increment--24K (#7730): (Mdl 1) Provides an additional 24,576 bytes of storage. Maximum: One. Limitations: Cannot be installed with #7710 or #7720. Field Installation: Yes. Note: If Storage Increment--8K (#7710) or Storage Increment--16K (#7720) is already installed, it must be removed to install this feature.

Storage Retention (#7785): Provides an internal battery and charger to power storage during a power interruption. All data and programs are protected so that a transaction in process when power was interrupted will continue when primary power is restored. The duration of storage retention depends on the charged state of the battery. When fully charged, storage will be retained for approximately 12 minutes. The number of times the battery is discharged greatly affects battery life; therefore, facilities are provided to allow the customer through programming, to deactivate the battery for scheduled power off conditions such as store closing. Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. Replacement batteries may be ordered through IBM (see "Accessories") or through other sources that meet the supply battery specifications as defined by IBM. Maximum: One. Field Installation: Yes. Prerequisites: Storage Retention (#7785) had to be specified on 3683 mdls 1, 2 or 3 when six of the following features are installed:

#4633 #5431
#4945* #5433

#4946* #6991
#5422* #8010

* mutually exclusive

Totals Retention (#8010): Provides an additional 240 bytes of customer programmable storage that are powered by its own battery to protect loss of information such as totals, transaction number, terminal address, etc. when power is turned off or power interruptions occur. An early warning status condition will be given to the program when the battery needs replacing. Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. (See "Accessories" for battery life characteristics and types of batteries required for replacement.) Maximum: One. Field Installation: Yes.

Validation Printer (#8725): (Mdls 1,1A, 3, 3A) Provides a flatbed document validation station for printing on inserted forms. Prints 38 characters per line at 15 characters per 25.4mm (inch). Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer allow logos, special graphics including Kanji and highlighting to be designed and printed by user programming. Maximum: One. Limitations: Cannot be installed with Label Printer (#8726). Field Installation: Yes.

Label Printer (#8726): (Mdls 1,1A, 3, 3A) Provides a flatbed station capable of printing on inserted forms or labels. Includes the capabilities of the Validation Printer Feature (#8725) and in addition includes the capability of printing labels. Prints 38 characters per line at 15 characters per 25.4mm (inch). Vertical line spacing is 6.3 lines per 25.4mm (inch) at the rate of 20 lines per second. The all points addressable characteristics of the printer allow logos, special graphics, and highlighting to be designed and printed by user programming. Label printing capabilities include "card stock"; shelf labels and gummed labels on a carrier. Maximum: One. Limitations: Cannot be installed with Validation Printer (#8725). Field Installation: Yes. Note: If the Label Printer feature is to be field installed in place of the Validation Printer (#8725), removed parts belong to the customer.

MODEL CONVERSIONS

Only upgrades to the "A" model designation from the same base model are available in the field (e.g., 1 to 1A). Customer Price Quotations and Customer Order Acknowledgement letters for purchase MESs must state "Installation of this base mdl change involves the removal of parts which become the property of IBM." Prerequisites: When upgrading a 3683 model 1 to a 3683 model 1A, Storage Increment-24K (#7730) is required.

ACCESSORIES

Battery, Storage Retention (P/N 8543856): ** A nickel cadmium battery that will provide power to retain data and programs in main storage and registers during a primary power interruption. A 12.5 volt battery is shipped with the initial order for Storage Retention Feature #7785.

Battery, Totals Retention: Provides power for 240 bytes of storage to secure totals, transaction sequence number, terminal address, and other user-defined data against power off or power interruptions. This power source (Eveready #E134, Mallory TR134R or equivalent) is customer replaceable. The capacity rating of this type of battery when new is approximately 1,000 milliamp hours. The life of the battery is determined by the shelf life which is approximately 9,000 hours. This means if a battery is installed in a 3683 six months after manufacture, its useful machine life will be six months on the average. It is recommended that the user's program test the battery state at least once per day. When the battery condition reaches the low threshold state, there are approximately 72 hours of battery life left. Procurement and replacement of the battery is the customer's responsibility. The customer must ensure

that the power is "On" on the terminal when the battery is replaced or all information will be lost.

Cash Till and Cover With Lock: Additional cash tills and till covers with locks may be ordered.

- Cash Till Cover with Lock and Keys P/N 1851126
- Cash Till P/N 1860161

Note: See "Locks and Keys" later in this section.

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

Version Stem Number/Key Alignment

OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal

-B Small raised projection in keytop
-C Circular, concave top on key button
-M Minimal concavity of circular keytop

Size	Units
Square	1 x 1
Single	1 x 1-1/3
Long	1 x 2
Double	1-1/3 x 2

Engraved Keytops: Keytops containing pre-defined messages are available for use on the 3683 terminal keyboards. Blank keytops are also available for customer engraving.

Retail Keytops: The following is a list of pre-defined keytops available in the 3650/3680 PSS-Retail Store System nomenclature:

Universal Keytops: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3683 Point of Sale terminal (and the 3684 Point of Sale control unit). These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in the four standard sizes and in two heights. They consist of two parts: a white bottom button and a

clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with either black or white ink. The user may define unique key button messages, print these messages on the desired color label, affix the printed color label to the white bottom key button and snap on the clear protective cover. Extra clear plastic covers are also available for use as spares.

Key Stops (P/N 1650058): ** The key stop is a small ring collar which is placed over the stem of a keybutton and under the keytop. The collar holds the keytop in the up position and prevents its use.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device which fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard.

Two keytop extractors are supplied with each 3651 controller. The customer may desire additional extractors.

Locks and Keys: The 3683 is equipped with a cash drawer lock and can be equipped with an optional journal lock #4690 and optional Manager Keylock #4905. In addition, the 3684 has an optional Diskette Cover Lock. The cash drawer lock and all other locks ordered will be shipped with two keys. The cash drawer lock, journal lock, manager lock, and diskette cover lock will be randomly selected unless specified otherwise (see "Special Features"). If the customer wishes to replace a unique lock, the order should state the 3683 machine serial number, lock name and the lock identification number (stamped on lock).

Note: Without an identification number, the order should state machine serial number, lock name and the words "NEW LOCK REQUIRED". Additional or replacement keys may be purchased from a local locksmith or from IBM Locks may be purchased from IBM and may be changed in the field. The following randomly selected locks (with two keys) may be ordered by P/N:

	P/N
3683/3684 Cash Drawer Lock	8543351
3683/3684 Journal Lock	8543620
3683/3684 Manager Lock	8547992
3684 Diskette Cover Lock	8543620

When ordering key blanks from a local locksmith or Hudson Lock, Inc., specify the Hudson Blank Number as follows:

IBM Lock Serial Number	Hudson Blank Key Number
IB101M THRU IB210M	KBYI10
IBM326 THRU IBM350	KBYL01
IBM426 THRU IBM525	KBYL02

Hudson Lock Inc., Sales Dept.
81 Apsley Street
Hudson, Massachusetts 01749

Loop Accessories: Female Loop Connector (P/N 5162880): The Female Loop Connectors will be used in all positions of the 3650 and 3680 Store Loops where terminals will potentially be installed. The corresponding male connector will either be the plug provided on each terminal or, in the case of the loop position currently not occupied by a terminal, the Loop Shorting Plug (see below).

Loop Shorting Plug (P/N 1860198): The Loop Shorting Plug will be used in all 3650 and 3680 Store Loop Positions that are not occupied by terminals. See "3650 Physical Planning Manual", GA27-3074, or "3680 Site Planning Guide" for details.

Store Loop Polarity Tester (P/N 1859559): ** The Store Loop Polarity Tester is used by the customer to check Loop wiring prior to installing 3650 and 3680 systems. One is provided at N/C for each controller site. Refer to the 3651 or 3684 "Specify" section of the sales manual. For details, see "3650 Physical Planning Manual", GA27-3074, or "3680 Site Planning Guide".

Magnetic Slot Reader (P/N 4123500 or RPQ 7B0563): The Magnetic Slot Reader (MSR) attaches by a 1.5m (4ft.11in.) cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. This slot reader accommodates a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards.

The MSR has three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. A magnetic reader attachment feature (RPQ 7B0560) on the appropriate machine is required to use the MSR. To order the MSR via Machine Order, for delivery with the 3683/3684, RPQ 7B0563 should be ordered. MES orders for the MSR should order P/N 4123500.

Maintenance: High densities of hard particulates may decrease MSR head life. In this environment, the customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Readers	Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. In countries other than Canada, warranty service for the Magnetic Scanners will be performed by the CE. In Canada, warranty service for the Magnetic Scanners will be performed at the Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form #2110, pack and mail it and the defective Scanner to:

IBM Canada Ltd.
Canadian Distribution Center
Dept. 415
75 Barber Green Road
Don Mills, Ontario M3C 1H7

Optionally, the customer can obtain post-warranty maintenance on a Time and Material basis from CE other than Canada. In Canada, optional IBM maintenance is available on a time and materials basis at the Repair Center. Authorization Form #2110 applies.

Note: A Magnetic Reader attachment feature RPQ 7B0560 is required to use the Magnetic Slot Reader.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 7034640 or equivalent, is required.

Paper: Roll paper 88.9mm (3.5 in.) diameter, 69.85mm (2.75 in.) wide is required at the cash receipt and journal print stations.

Contact IBM.

3684 POINT-OF-SALE CONTROL UNIT

PURPOSE

A user-programmable input/output, data collection and processing terminal with a 985,088 byte integrated diskette for the 3680 Programmable Store System. Model 1 of the 3684 is designed for single terminal stores. The 3684 model 1 contains a single programmable segment with appropriate features to allow the user to perform the point-of-sale, data collection, credit authorization, price look-up, inquiry, data entry and host communication functions. The point-of-sale features and functions are similar to the 3683 Point-of-Sale Terminals.

Model 2 of the 3684 is designed to perform the Point of Sale function and to act as a master control in multiple terminal stores. There are two self-contained programmable segments, one to perform the point-of-sale function similar to the 3683, and the second to perform the control function for communication with its own point-of-sale segment and with additional loop-attached 3683 (models 1, 2 or 3) terminals. In addition, the control segment controls the diskette and host communication input/output functions.

MODELS 1, 2

Model 1 001: Single unit

Model 2 002: Master unit

Prerequisites:

1. A 3704, 3705 or 3725 in 2701, 2703 Emulation Mode (or Integrated Communications Adapter) for BSC system and in NCP/VIS mode for SDLC systems (with appropriate features ... see M3704, 3705 and 3725 pages) attached to any virtual storage S/370 or 4300 processor.
2. A keyboard (#2712 or #2713) and a display (#3331, #3332, #3346 or #3348) must be ordered for each 3684.
3. A 3720 in 2701, 2703 Emulation Mode for BSC system and in ACF/NCP Mode for SDLC system attached to any virtual storage 4341, 4361, 4381, 303X, 308X or 3090 processor.

HIGHLIGHTS

A modular input/output unit with features that provide for an integrated or a limited distributed (cash drawer and display) package. It features data entry by keyboard or from a magnetic, non-IBM EAN/UPC, or non-IBM OCR hand-held reader and data output by an 8-digit numeric display, with up to 32 indicators for operator guidance and machine status conditions, or an alphameric display with 36 character positions and printing of input or output data under program control. It features a cash drawer with removable till and adjustable divider option. An integrated diskette is used for customer program storage, data and table storage, diagnostic programs and error logging. The minimum configuration must include a base unit plus a keyboard and a display. (See "Prerequisites".)

Base Unit: Consists of (1) programmable segments and storage (56K for mdl 1; mdl 2 has 32K for the point-of-sale segment and 56K for the control segment.); (2) a matrix printer with a cash receipt station; and (3) a 985,088 byte diskette drive. An audible alarm, activated when predetermined events require operator attention or intervention for system operation, is also part of the base unit.

Printer: A matrix, bidirectional printer which prints a 38-character print line at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. It uses an easily replaceable cartridge ribbon. In addition to the standard character sets, an all-points addressable capability allows (by customer programming) printing of logos and special graphics including Kanji. Additional print stations can be

ordered by special feature. The cash receipt station will accept 88.9mm (3.5") diameter roll paper, 69.85mm (2.75 in.) wide.

Diskette: A 985,088 byte Diskette 2D is used on both mdls. The diskettes are formatted to 256 byte blocks. The diskette is removable and interchangeable.

Communications: All 3684 mdls may have BSC or SDLC communication capability. Depending on customer selection at system generation, either or both protocols may reside in the terminal and either may become active when loaded from the diskette.

System Attachment: The 3684 mdls 1 and 2 attach to any virtual storage S/370 or 4300 processor via a 3704, 3705, 3720 or 3725 Communications Controller in 2701, 2703 Emulator Mode (or Integrated Communications Adapter) for BSC systems and in NCP/VIS mode for SDLC systems. Attachment is over communication lines at speeds of 600, 1200, 2400 or 4800 bps. The 3684 has the capability of concurrent host communication and point-of-sale function, which allows store operations to continue when transmitting or receiving data from the host processor.

The 3684 mdl 1 and 2 can communicate with the 8100 System over nonswitched communication facilities using SDLC, and with the Series/1 over switched, nonswitched point-to-point or multipoint facilities using BSC. The Host Command Processor (HCP) Facility in the 3684 can communicate with a user program in the 8100 executing at the Data Stream Interface, or with a user program in the Series/1 using Read/Write support of the Realtime Programming System. A user-written program in the 3684 can communicate with a user program in the 8100 at the DSI level or in the DPPX/DTMS environment, or with a user program in the Series/1 using RPS Read/Write communications support.

Communications Facilities: The 3684 operates in data half-duplex point-to-point or multipoint mode on half-duplex or duplex facilities at transmission speeds of 1200/600, 2400/1200, 4800/2400 bps on nonswitched facilities. In addition, the 3684 also operates in half-duplex point-to-point mode at transmission speeds of 1200/600, 2400/1200 and 4800/2400 bps on switched facilities. See M2700 pages.

Modems: A 1200 bps Integrated Modem feature (#5530) or an external modem may be attached to a 3684. External modems require the External Modem Interface feature (#3701).

Modems	Speed (bps)	Lines
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw or Sw voice grade
3864-1,2	4800/2400	Nonsw or Sw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3872-1	2400/1200	Nonsw or Sw voice grade
3976-3	1200/600	Nonsw or Sw voice grade
5811-10	2400/4800/ 9600	Limited distance modem
5811-18		Rack mount version of mdl 10
5811-20	2400/4800/ 7200/9600	Nonsw baseband Rack mount version of mdl 20
5811-28		
5812-10	2400/4800/ 7200/9600	Nonsw baseband
5812-18		Rack mount version

MACHINES

of mdl 10

Note: 4-wire Switched Network Backup is available on 3863, and 3864 modems with feature #7953 installed.

Switched network backup mode of operation is possible using an appropriately featured external modem. For communications capabilities, product utilization and special features, see M2700, 3863, 3864, 3872 pages.

In-Store Communications: The 3684 mdl 2 performs a master control function for 3683s that are attached to the 3684 by a 2400 or 4800 bps loop. Interactive communication capability exists between the 3684 and 3683s for data collection, price look-up, credit, and diagnostic facilities. All mdls of the 3684 receive their initial machine load (IML) from a S/370 or 4300 host processor either by physical diskette transport or by teleprocessing. The 3684 IML and the IMLs for 3683s associated with a 3684 mdl 2 are maintained on the diskette. The 3684 mdl 2 transmits the 3683 IML when requested by the 3683.

Limitations: The 3684 mdl 2 has a limited number of optional feature positions available to the customer. If Storage Expansion-POS (#6991) is required by your customer, then a maximum of two feature positions are available. When selecting the features to be installed, the sum of their unit values should not exceed 2 and specify code #9444 should be indicated. If Storage Expansion-POS (#6991) is not required, then a maximum of four feature positions are available. When selecting the features to be installed, the sum of their unit values should not exceed 4 and specify code #9445 should be indicated.

If your customer does not initially install Storage Expansion-POS (#6991) and specifies #9445 to provide additional feature capability and decides after installation that he required Storage Expansion-POS (#6991), then the feature capability provided by #9445 will have to be replaced at customer expense. When this occurs you must recalculate the unit value to ensure you have not exceeded a sum total of 2.

Feature	Unit Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
*Non-IBM OCR Hand-Held Reader Adapter (#5422)	1
*Magnetic Wand Reader (#4945)	1
IML Write Adapter (#4634)	1
*Non-IBM EAN/UPC Wand Attachment (#4946)	2

* = Mutually Exclusive

See RPQ 8Q0322 for additional feature position configurations applicable to the External Storage Attachment Feature #4500.

Customer Responsibilities: See S3680 pages for general description of customer responsibilities.

Proposal/Acknowledgement Letter Statements: Each proposal and acknowledgement letter must include the following statement:

"It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3684 which contains cash or other valuables. It will be the customers' responsibility to remove, control and replace cash so that IBM can fulfill its warranty and maintenance obligations.

When a failure occurs in the cash drawer of any 3684 and it cannot be opened prior to maintenance by IBM, the Customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Customer Setup: The 3684 will be shipped with customer setup instructions. The customer is responsible for:

- Unpacking, placement, set up and checkout of the 3684 at time of delivery, or when relocating the 3684.
- Relocation of the 3684 (if required) to allow IBM service access.
- Using and following the problem determination procedures.
- Physical set up and connection of cables to TP lines/modems and loop.

Maintenance: 3684s located in the immediate sales area may preclude the acceptability of repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the unit to a repair facility located within the store for subsequent repair. At this location the CE will repair and test the unit.

Storage Increments

1. Storage Increments -- 8K (#7710) and 24K (#7730) apply to the Point-of-Sale segment of the 3684 mdl 2 only. Storage Increment -- 16K (#7720) applies to the 3684 mdl 1 and 2 when Storage Expansion (#6990) is installed. If #6990 is not installed, then #7720 applies only to the Point-of-Sale segment of the 3684 mdl 2.
2. When storage is upgraded by field installation, the new Storage Increment feature displaces the old. Removed parts belong to the customer. Prior to using a removed module in another 3684, the compatibility of the part should be verified and an RPQ must be submitted to allow reinstallation on another machine.

SPECIFY

- Voltage (AC, 1-Phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	120V #2800
200V #2806	
220V #2813	
230V #2821	
240V #2801	

Note: A 2.8m (9 ft) power cord and plug will be shipped with each machine from the plant of manufacture. The country code will be used to select a power cord and plug to the specifications most commonly used in that country.

Specify #2710 for power cord without a plug.

For Canada only, specify #9890 for locking plug, #9891 for nonlocking plug (both at 60 Hz, 120V, 1-phase). For Japan only, specify #9890 for locking plug, #9891 for nonlocking plug (for either 50 Hz or 60 Hz, 100V 1-phase)

Note: 120V AC, 60 Hz is compatible with existing 115V Systems.

- Store Loop Polarity Tester: Order Store Loop Polarity Tester, P/N 1859559 on MES (group 91) from Raleigh Order Department. One is furnished at no charge to each 3684 mdl 2 site for testing store loop wiring.

Note: The customer must provide (purchase, install and maintain) all necessary 3680 store loop communication lines within the store. Bulk loop cable is available from IBM.

- The loop polarity tester matches receptacle (female loop connector P/N 5162880) which can be ordered from IBM
- Machine Nomenclature:

Canadian English #2934	German #2929
Canadian French #2935	Italian #2932
English US #2950	Spanish #2931
French #2928	

- Controller Designation: Specify #9491 on the first 3684 to be used with a host system location and specify #9492 on each additional 3684 in the network. Specification of #9491 will result in 3684 controller and 3683 terminal code (DTR) being sent to specified host location.

When #9491 is specified, additional information must be specified as follows:

- Specify one of the following to indicate magnetic tape density (media) used at the host system location. This tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

#9412 -- 9 track, 800 bpi
#9413 -- 9 track, 1600 bpi
#9414 -- 9 track, 6250 bpi

The 3684 controller and 3683 terminal data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

- Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

Line 1 -- IBM Programming Systems Representative
Line 2 -- c/o (Name of Customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 -- City,
Country (Province), Postal Code

This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code #9491). Whenever controller data is updated by an EC, the EC will be shipped to the most current microcode control (MC) address.

- Storage Expansion: If Storage Expansion-POS (#6991) is required specify #9444; if Storage Expansion-POS (#6991) is not required, specify #9445. See "Limitations" above.
- If #9491 is specified and there is a storage requirement that prevents 3683 operation with the current level of control code, specify #9490 with #9491. #9490 provides 3683 Control Code level EC 320503 which operates in the same control storage allocation as is required for 3683 Control Code level EC 320502. It is strongly recommended that new customers and 3687 customers do not take this specify option.

SPECIAL FEATURES

Non-Communications Features

Cash Drawer Integrated - 1st (#1572): Provides a cash drawer with removable till that is contained within the 3684 base unit. The cash drawer has a media slot that will accommodate approximately a 25mm (1 inch) stack of documents. Opening the cash drawer is under program control. A cash drawer lock is provided. See note below for special ordering instructions for lock and till with adjustable dividers. Maximum: One. Limitations: Only one additional cash drawer may be ordered - either Cash Drawer Integrated-2nd (#1573), Cash Drawer-Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577). Field Installation: Yes.

Cash Drawer Integrated - 2nd (#1573): Provides a second Integrated Cash Drawer with housing and removable till and is installed directly below Cash Drawer Integrated-1st (#1572). Functionally equivalent to Cash Drawer Integrated-1st (#1572). Maximum: One. Prerequisites: #1572. Field Installation: Yes.

Cash Drawer-Distributed (#1575): Provides a distributed cash drawer with housing and removable till that can be located up to 3.6ms (12 ft) from the 3684 base. Functionally equivalent to Cash Drawer Integrated-1st (#1572). Maximum: Two if no other cash drawer is ordered. One if Cash Drawer Integrated-1st (#1572) or

one non-IBM Cash Drawer Attachment (#1577) is ordered. Field Installation: Yes.

Non-IBM Cash Drawer Attachment (#1577): Provides an IBM-defined interface with cable and plug for attaching an non-IBM Cash Drawer. Maximum: Two if no other IBM Cash Drawer is installed. One if a Cash Drawer Integrated-1st (#1572) or Cash Drawer-Distributed (#1575) is ordered. Limitations: An attached non-IBM Cash Drawer must meet the IBM-defined interface as stated in the "IBM 3680 PSS Cash Drawer Attachment (#1577) Product Attachment Information" available from Industry Relations. Field Installation: Yes.

Notes

- For cash drawer tills and covers, see "Accessories" in the M3683 pages.

- Cash Drawer Lock: Each IBM Cash Drawer (#1572, #1573 or #1575) is equipped with a lock. A group of 25 unique lock numbers has been reserved to allow the customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following features on the cash drawer order:

#9101	#9106	#9111	#9116	#9121
#9102	#9107	#9112	#9117	#9122
#9103	#9108	#9113	#9118	#9123
#9104	#9109	#9114	#9119	#9124
#9105	#9110	#9115	#9120	#9125

If none is specified, a lock will be selected at random from a larger group of lock types. Each cash drawer will be shipped with two cash drawer keys.

- Specify #9799 for each IBM Cash Drawer ordered (#1572, #1573 or #1575) if a till with movable bill dividers is desired.

Distributed Keyboard Attachment (#3240): Provides for locating the keyboard up to 3.6ms (12 ft) from the 3684 base. Prerequisites: #2712 or #2713. Maximum: One. Field Installation: Yes.

Diskette Cover Lock (#3310): Provides a lock for the diskette cover. (See Note below for special lock selection.) Maximum: One. Field Installation: Yes.

Note: Three groups of 10 unique specify numbers have been reserved to allow a customer to order a specific journal lock, manager keylock or diskette cover lock for each terminal. (The 3683 and 3684 uses the same journal lock and manager lock numbers, therefore all terminals within a store could have the same lock if desired.) If the same lock is desired on the journal, manager keylock and diskette cover, specify the respective locks with the same value in the last digit. That is, if #9203, #9303 and #9213 are specified, the same lock #9203 will be installed at all locations.

Journal Lock	Manager Keylock	Diskette Cover Lock
#9201	#9301	#9211
#9202	#9302	#9212
#9203	#9303	#9213
#9204	#9304	#9214
#9205	#9305	#9215
#9206	#9306	#9216
#9207	#9307	#9217
#9208	#9308	#9218
#9209	#9309	#9219
#9210	#9310	#9220

If none is specified, a lock will be selected at random from a larger group of lock types. Each lock feature will be shipped with two keys. For additional or replacement keys, see "Accessories".

Display, 1-Sided (#3331): An operator display and guidance unit consisting of an 8-digit numeric display and 32 indicators for operator guidance and machine status. The display is used to display numeric input or output data such as item number, credit number,

totals, amount due, etc. The 32 indicator lights point to labels that describe: (1) machine status such as: Ready, Wait, Offline, etc. (2) step-by-step guidance to lead the operator through a transaction or procedure. The unit will be shipped with the indicators labeled to correspond to the country language specified. However, the customer may re-label all but five indicators and, under customer program control, define their use. A legend sheet with a variety of legends will be shipped with each machine. Maximum: One. Limitations: Cannot be installed with Display, 2-Sided (#3332), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Display, 2-Sided (#3332): An operator and customer display guidance unit which contains all the functions of Display, One-Sided (#3331) plus an 8-digit numeric display with six indicators on the back of the unit for customer viewing. Maximum: One. Limitations: Cannot be installed with Display, 1-Sided (#3331), Display-Customer Remote (#3333), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Display-Customer Remote (#3333): A customer display and status indicator unit that is connected to the 3684 by a 3.6m (12 ft) cable. The unit consists of an 8-digit numeric display and 12 indicators (six are shipped with labels and six without). All are relegendable. The display and indicators are under customer program control. Maximum: One. Prerequisites: #3331. Limitations: Cannot be ordered with Display, 2-Sided (#3332), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Distributed Display Attachment (#3335): Provides for distributing Display, 1-Sided (#3331) or Display, 2-Sided (#3332) up to 3.6ms (12 ft) from the 3684 base. Maximum: One. Prerequisites: #3331 or #3332. Limitations: Cannot be installed with Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). Field Installation: Yes.

Alphameric Display (#3336) (NO LONGER AVAILABLE): An operator/customer display consisting of two rows of eighteen characters each for a total of thirty-six characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3684. Maximum: One. Limitations: Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Remote 2nd Alphameric Display (#3337) (NO LONGER AVAILABLE): A customer display that is connected to the 3684 by a 3.6m (12 ft) cable. The display consists of two rows of eighteen characters, each for a total of thirty-six characters and is used to display numeric as well as alphabetic data such as item number description, etc. Maximum: One. Prerequisites: #3336. Limitations: Cannot be installed with numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Distributed Alphameric Display Attachment (#3338) (NO LONGER AVAILABLE): Provides a cable for distributing the Alphameric Display (#3336) up to 3.6ms (12 ft) from the 3684 base. Maximum: One. Prerequisites: #3336. Limitations: Cannot be installed with numeric display (#3331, #3332, #3333 or #3335). Field Installation: Yes.

Alphameric Display, Type II (#3346): An operator/customer display consisting of two rows of 18 characters each for a total of 36 characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3684. Maximum: One. Limitations: Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335) or with Alphameric Display (#3336 or #3337). Field Installation: Yes.

Distributed Alphameric Display, Type II, Attachment (#3348): Provides for distributing the Alphameric Display, Type II (#3346) up to 3.6m (12 ft) from the 3684 base. Maximum: One. Prerequisites: #3346. Limitations: Cannot be installed with a numeric display

(#3331, #3332, #3333 or #3335) or with Alphameric Display (#3336 or #3337). Field Installation: Yes.

External Modem Interface (#3701): Provides an EIA/CCITT interface for attachment of an IBM or other external modem. Limitations: Cannot be ordered with 1200 bps Integrated Modem (#5530). Maximum: One. Field Installation: Yes. Specify the following as applicable:

1. Specify #9695 if the 3684 is required to provide clocking (1200 bps maximum).
2. Specify #9126 if the 3683, 3684, 3672 Modem or #2838 if the 3976 Modem is to be attached.

Expansion Feature (#3890): Provides additional facilities on the 3684 mdl 1 to accommodate features that cannot be installed on the base unit. Maximum: One. Limitations: Applies to 3684 mdl 1 only. Prerequisites: This feature is a prerequisite to install #4945, #4946, #5422, #5431 or #5433. Field Installation: Yes. Note: No expansion feature is required on the 3684 mdl 2 to install its applicable features.

External Storage Attachment (#4500): Provides the ability to attach the External Disk Drive Feature (#4501). Maximum: One. Limitations: Mutually exclusive with IML-Write adapter (#4634). Applies to 3684 mdl 2 only. Field Installation: Yes.

External Disk Drive (#4501): Provides a 10MB file for attachment to the 3684 mdl 2 for storage of user data files. Cable attached to the 3684. Limitations: Applies to 3684 mdl 2 only. Prerequisites: #4500. Field Installation: Yes. When this feature is field installed the customer is responsible for performing the customer set up procedure.

IML-Write Adapter (#4634): Provides the 3684 mdl 2 with the ability to write an IML (Initial Machine Load) tape on a user-provided tape cassette recorder (refer to IBM 3680 Planning and Site Preparation Guide, GA27-3213, for Cassette Recorder interface requirement) which can be read by a 3683 Point-of-Sale terminal equipped with an IML-Read Adapter (#4633) feature. Maximum: One. Limitations: Applies to 3684 mdl 2 only. Mutually exclusive with 4800 bps Loop (#4710) and with External Storage Attachment (#4500). Field Installation: Yes.

Journal Lock (#4690): Provides a special lock and security cover over the printed journal. (See Note below for special lock selection.) Maximum: One. Prerequisites: #4695. Field Installation: Yes.

Journal Printer (#4695): Provides a journal print station with a journal roll take-up mechanism. Print line length is 38 characters at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer permit the customer to highlight exceptions through special graphics designed and controlled by user programming. A 12.7mm (.5 inch) signature window is provided. Maximum: One. Field Installation: Yes. The journal station will accept 88.9mm (3.5 inch) diameter roll paper, 69.85mm (2.75 inch) wide.

4800 bps Loop (#4710): Provides a 3684 mdl 2 loop speed of 4800 bps in place of the standard loop speed of 2400 bps. Loop speed for 3683s to be attached must be specified as same speed. Maximum: One. Limitations: The sum of the communication speeds of all operational communications attachments to a 3684 mdl 2 must not exceed 7200 bps. These attachments include the store loop, host communications, and Serial I/O RPQ MN2257. Mutually exclusive with IML-Write adapter (#4634). Applies to 3684 mdl 2 only. Field Installation: Not recommended.

Manager Keylock (#4905): Provides a keylock mounted on the keyboard that allows customer programming to interrogate the position of the keylock when the key is operated. Possible uses include the enforcement of a manager override to a restricted security function. (See note below for special lock selection.) Maximum: One. Prerequisites: #2712 or #2713. Field Installation: Yes.

Keyboards, General: All keyboards have customer-legendable keybuttons except for the 11 keybuttons which have molded leg-

ends. All single- and double-function keys are under customer program control. Double keys may be moved, added or deleted by the user. Several colors and sizes of decal sheets with common legends by country language will be shipped with the 3684. See "Accessories" section for released keybuttons that may be ordered for any unique customer requirement. Maximum: One #2712 or #2713. Field Installation: Yes.

35-Key Modifiable Keyboard (#2712): A 35-key keyboard that includes:

- 5 Legended system function keys.
- 19 Unlegended function keys.
- 11 Keys with round, numeric legended keybuttons in the data entry arrangement.

48-Key Modifiable Keyboard (#2713): A 48-key keyboard that includes:

- 5 Legended system function keys.
- 32 Unlegended function keys.
- 11 keys with round, numeric legended keybuttons in the data entry arrangement.

Note: No Expansion Feature is required on the 3684 mdl 2 to install any applicable features.

Magnetic Wand Reader (#4945): A hand-operated wand used to read single track delta distance encoded magnetic merchandise tickets, credit cards, employee badges, etc. The small lightweight wand attached via a 1.2m (4 ft) long flexible cord allows encoded merchandise tickets to be read without removing them from the merchandise. See Note. Prerequisites: #3890 must be installed on 3684 mdl 1. Limitations: Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a non-IBM OCR Wand Adapter (#5422). Maximum: One. Field Installation: Yes. Note: The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request.

Non-IBM EAN/UPC Wand Attachment (#4946): Provides an adapter to support the attachment of a non-IBM EAN/UPC Bar Code hand-held wand reader. This feature provides an external connector to attach the non-IBM wand reader. The types of wand readers that can attach to this feature are either analog output wand readers (Intermac 1233R or equivalent) or digital output wand readers (Hewlett-Packard HEDS 3000 or equivalent) that meet the requirements stated in the "Non-IBM EAN/UPC Wand Reader Attachment Product Attachment Information for the 3680" document which is available from Industry Relations. Prerequisites: On the 3684 mdl 1, Expansion Feature #3890. The IBM Multiple Supplier Systems Bulletin (G120-6648) applies to the non-IBM wand reader. Limitations: When this attachment is used with an analog output wand reader, it is possible that this feature may experience failures if operated within five miles of a high power AM transmitter of the type used for television broadcasting. Cannot be installed with the Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422). Maximum: One. Field Installation: Yes. Specify: #9660 for analog wand interface or #9661 for digital wand interface.

Non-IBM OCR Hand-Held Reader Adapter (#5422): Provides an adapter to support the attachment of a non-IBM OCR hand-held wand reader that meets the requirements stated in the "IBM Retail System OCR A/B Wand Reader Product Attachment Information" document which is available from Industry Relations. This feature provides a 1.83m (6 ft) cable with an ITT - Cannon DBC-25S type connector to attach the non-IBM OCR Hand-Held Reader unit. Prerequisites: #3890 must be installed on 3684 mdl 1. Limitations: Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a Magnetic Wand Reader (#4945). Maximum: One. Field Installation: Yes.

Non-IBM Coin Dispenser Adapter (#5431): Provides an IBM-defined serial interface for attaching a non-IBM Manufactured Coin Dispenser that meets the requirements stated in the "3680 PSS System non-IBM Coin Dispenser Adapter Product Attachment Information" document which is available from IBM. For further information on the attachment, contact IBM. Prerequisites: #3890 for 3684 mdl 1 only. Maximum: One. Field Installation: Yes.

Non-IBM Scale Adapter (#5433): Provides an IBM-defined serial or parallel interface for attaching a non-IBM Manufactured Scale that meets requirements stated in the "IBM 3680 PSS non-IBM Scale Adapter Product Attachment Information" document which is available from Industry Relations. For further information on the attachment, contact IBM. Specify: #9385 if Serial Interface is to be installed; #9386 if Parallel Interface is to be installed. On Parallel Interface, specify #9387 if scale is a 10K metric scale. On Serial Interface, specify #9388 if scale is a 5-digit scale. Otherwise, scale is assumed to be a 4-digit scale. Prerequisites: #3890 for 3684 mdl 1 only. Maximum: One. Field Installation: Yes.

COMMUNICATIONS FEATURES

A 3684 may be equipped with either the External Modem Interface (#3701) or the 1200 bps Integrated Modem (#5530) features.

Note: A 6.1m (20 ft) communication cable is provided for attachment to a standalone modem or to a communications facility when an integrated modem is used. If a standard 6.1m communication cable is not desired, specify #9061 for 3.0m (10 ft) cable, #9062 for 9.1m (30 ft) cable or #9063 for 12.2m (40 ft) cable.

External Modem Interface (#3701): Provides an EIA/CCITT interfaces for attachment of an IBM or other external modem. Limitations: Cannot be ordered with 1200 bps integrated Modem (#5530). Maximum: One. Field Installation: Yes. Specify the following as applicable:

1. Specify #9695 if the 3684 is required to provide clocking (1200 bps maximum).
2. Specify #9126 if the 3863, 3864, 3872 Modem or #2838 if the 3976 Modem is to be attached.

1200 bps Integrated Modem (#5530): Provides an integrated modem for operation over switched or nonswitched communication facilities at 1200 bps. Auto answer is provided when operating over switched network. No external modem is required. Limitations: Cannot be installed with External Modem Interface (#3701). Maximum: One. Field Installation: Yes. Specify the following when ordering this modem:

Specify one: #2830 for Switched Network, #2834 for Nonswitched Network.

(Canada only > If #2830 switched network is specified, also specify (one):

#9777 for 2025 Hz answer tone frequency required for operation at 1200 bps with non-IBM modems with Automatic Calling features.

#9778 for 2100 Hz answer tone frequency required for operation with host IBM 1200 bps integrated modems with Automatic Call Originate function. <)

If #2834 Nonswitched Network is ordered, also specify (one):

#9651 for 4-wire facility
#9652 for 2-wire facility

(Except Canada > Note: This feature includes the PSN line plate which is mandatory for attaching to the public switched telephone network. <)

Storage Expansion (#6990): Provides the capability of expanding the storage capacity of the 3684 mdl 1 and the control segment of the 3684 mdl 2 from a maximum of 56K to a maximum of 120K bytes. See configurator chart for maximum storage. Maximum: One. Field Installation: Yes. Limitations: Applies only to the 3684 mdl 1 and to the control segment of the 3684 mdl 2. Cannot be installed on a 3684-2 which had Storage Expansion-POS (#6991) installed prior to August 1981.

Storage Expansion-POS (#6991): (Mdl 2) Provides the capability of expanding the storage capacity of the point-of-sale segment of the 3684 mdl 2. The storage capacity of the point-of-sale segment is expanded from a maximum of 56K bytes to a maximum of 120K

bytes. This feature permits the installation of up to four Storage Increment-16K (#7720) per #6991. Maximum: One. Field Installation: Yes. Limitations: Storage Retention (#7785) cannot be installed on a 3684 mdl 2 that has Storage Expansion (#6990) and Storage Expansion-POS (#6991) installed at the same time. Note: This limitation is removed for machines shipped after August 1981. Prerequisites: #7730.

Storage Increment -- 8K (#7710): Provides an additional 8,192 bytes of storage. Maximum: One. Limitations: Cannot be installed with Storage Increments -- 16K (#7720) or Storage Increment -- 24K (#7730). Field Installation: Yes.

Storage Increment--16K (#7720): Provides an additional 16,384 bytes of storage. Maximum: One per 3684 mdl 2 point-of-sale segment; without Storage Expansion-POS (#6991) installed; four with Storage Expansion-POS (#6991) installed; four per 3684 mdl 1 or 2 control segment with Storage Expansion (#6990). Limitations: Cannot be installed with Storage Increment -- 8K (#7710) or Storage Increment -- 24K (#7730) in point-of-sale segment of 3684 mdl 2. Cannot be installed in the 3684 mdl 1 or the control segment of the 3684 mdl 2 without #6990. Specify: #9588 if increment is to be installed in point-of-sale segment of 3684 mdl 2; #9589 if increment is to be installed in control segment of 3684 mdl 2. Field Installation: Yes.

Storage Increment--24K (#7730): Provides an additional 24,576 bytes of storage. Maximum: One. Limitations: Cannot be installed with Storage Increment -- 8K (#7710) or Storage Increment -- 16K (#7720). Field Installation: Yes.

3684 Mdl 1 Storage Configurator

104K	16K-#7720 (3)			x				x
120K	16K-#7720 (4)			x				x

Note: The number of #7720s must equal the sum of specify code #9588s and #9589s when #6990 and/or #6991 is ordered.

Storage Retention (#7785): Provides an internal battery and charger to power storage during a power interruption. All data and programs are protected so that a transaction in process when power was interrupted will continue when primary power is restored. The duration of storage retention depends on the charged state of the battery. When fully charged, storage will be retained for approximately 12 minutes for mdl 1 and approximately six minutes for mdl 2. If Storage Expansion (#6990) and Storage Expansion-POS (#6991) are installed on the same 3684 mdl 2, a fully charged battery will retain storage for approximately three minutes. The number of times the battery is discharged greatly affects battery life; therefore, facilities are provided to allow the customer through programming, to deactivate the battery for scheduled power off conditions such as store closing.

Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. Replacement batteries may be ordered through IBM or through other sources that meet the battery specifications as defined by IBM. Maximum: One. Limitations: Cannot be installed on a 3684 mdl 2 that has Storage Expansion on both the point-of-sale segment and control segment. This limitation is removed for machines shipped after August 1981. If Storage Retention (#7785) is required on machines installed prior to August 1981, an RPQ will have to be submitted. Any parts removed due to this RPQ will be retained by IBM as property of IBM. Field Installation: Yes.

Totals Retention (#8010): Provides an additional 240 bytes of customer programmable storage that are powered by its own battery to protect loss of information such as totals, transaction number, terminal address, etc., when power is turned off or power interruptions occur. An early warning status condition will be given to the program when the battery needs replacing. Replacement batteries to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time-and-material basis. See "Accessories" for battery life characteristics and the types of batteries required for replacement. Maximum: One. Limitations: Applies to 3684 mdl 1 and to the Point-of-Sale segment of the 3684 mdl 2. Field Installation: Yes.

Validation Printer (#8725): Provides a flat-bed document validation station for printing on inserted forms. Prints 38 characters per line at 15 characters per 25.4mm (1 inch). Vertical line spacing is 6.3 lines per 25.4mm (1 inch) at a line space rate of 20 lines per second.

MACHINES

The all-points addressable characteristics of the printer allow logos, special graphics including Kanji and highlighting to be designed and printed by user programming. Maximum: One. Limitations: Cannot be installed with Label Printer (#8726). Field Installation: Yes.

Label Printer (#8726): Provides a flat-bed station capable of printing on inserted forms or labels. Includes the capabilities of the Validation Printer Feature (#8725) and in addition includes the capability of printing labels. Prints 38 characters per line at 15 characters per 25.4mm (1-inch). Vertical line spacing is 6.3 lines per 25.4mm (1-inch) at the rate of 20 lines per second. The all points addressable characteristics of the printer allow logos, special graphics, and highlighting to be designed and printed by user programming. Label printing capabilities include "card stock" shelf labels and gummed labels on a carrier. Maximum: One. Limitations: Cannot be installed with Validation Printer feature (#8725). Field Installation: Yes. Note: If the Label Printer is to be field installed in place of the Validation Printer (#8725), removed parts belong to the customer.

MODEL CONVERSIONS

Field installable. The parts removed for a model change become the property of IBM.

ACCESSORIES

Cables: IBM shielded twisted pair cable (or equivalent) or bulk indoor loop cable is required for attachment of 3650 units. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for instal-

lation and maintenance of the cable and associated accessories. Twisted pair cable - For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and information, refer to the Systems Supplies operation within your country.

Bulk Indoor Loop Cable (P/N 5165886): See "Physical Planning Manual", GA27-3074, or "3680 Site Planning and Site Preparation Guide", GA27-3201, for bulk loop specifications.

Cables (P/N 7838695): Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to 105 C. This Bulk Indoor Loop Cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). Warranty: Loop Cable is warranted free from defects of workmanship and materials for 90 days.

For other available accessories, see "Accessories" in the M3683 pages.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 7034640 or equivalent, is required.

Diskette: Diskette 2D, P/N 1766872, or equivalent, formatted with 256 byte blocks, is required for 3684 mdls 1 and 2.

Paper: Roll paper, 88.9mm (3.5 inch) diameter, 69.85mm (2.75 inch) wide, is required at the Cash Receipt and Journal print stations.

3687 CHECKOUT SCANNER

PURPOSE

A fixed head optical reader which attaches to the 3683 (all models). It is particularly adaptable to all modes of checkout and it accommodates both standing and seated operators.

MODELS

- Model 1 001 (NO LONGER AVAILABLE)
- Model 2 002

HIGHLIGHTS

The 3687 Mdl 1 is 216.0mm (8.50 in.) high, not including the rails; 508.0mm (20.00 in.) wide; and 278.0mm (10.94 in.) deep, and reads the UPC regular (Version "A"), UPC zero suppression (Version "E"), EAN-13, and EAN-8 bar code symbols on supermarket items that are manually fed past the window of the 3687. Packaged as part of the total checkstand design, one 3687 can operate with one 3683 Supermarket Terminal mdl 1A, 2A or 3A.

The 3687 Mdl 1 is a Class 1 laser product which complies with the safety standards of the United States Department of Health, Education, and Welfare (Performance Standard for Laser Products, August 2, 1976 - Class 1, CFR Subchapter J).

The 3687 Mdl 2 is a flattop, rail-less, scanner with the same exterior dimensions as the 3687 Mdl 1. The 3687 Mdl 2 reads the UPC regular (Version "A"), UPC zero suppression (Version "E"), EAN-13, and EAN-8 bar code symbols on products that are manually fed past the window of the scanner.

(Except Canada, Japan > The 3687 Mdl 2 is equipped with a standard scratch resistant window.

(Canada, Japan only > The 3687 Mdl 2 is equipped with a standard replaceable window. Special Feature #3005 is available that provides a plant installed Scratch Resistant Window.

The 3687 Mdl 2 complies with the requirements for a (Canada, Japan only > Class IIa laser product as specified in the laser product performance standards of the United States Department of Health and Human Services regulation 21CFR1040.10 - Laser Products Performance Standards. In Accordance with U.S. Federal Regulations the 3687 Mdl 2 has the following "Warning Label" visible through the scanner window, "Class IIa Laser Product - Avoid Long-Term Viewing of Direct Laser Light". A similar bilingual label as approved for Canadian regulations will be installed on Canadian machines. (Except Canada, Japan > Class 1 laser product as specified in the IEC/TC-76 (CO)8 - Safety

of laser products, equipment classification, requirements and user's guide.

The product reads the Universal Product Code (UPC) which has been adopted in the United States as an industry specification for supermarket items identification. It also reads the European Article Numbering (EAN) symbol which has been adopted in World Trade countries as an industry specification for merchandise identification.

Prerequisites: The 3687 Mdl 1 requires a 3683 mdl 1A, 2A or 3A.

The 3687 Mdl 2 attaches to the 3683 Mdls 1, 2 and 3 via the Non-IBM OCR Hand-Held Reader Adapter (#5422) and to the 3683 Mdls 1A, 2A and 3A via the scanner adapter which is standard on these models. These adapters operate only under the 3650 Programmable Store Systems.

Customer Responsibilities: 3687 window replacement is a customer responsibility. See S3650 pages for general description of customer responsibilities.

Copies of the UPC Symbol Specifications and the UPC Guidelines are available at a charge from the UPC Council. Write to:

Uniform Product Code Council, Inc.
7061 Corporate Way, Suite 106
Dayton, Ohio 45459
513-435-3870

For copies of the General Specifications for the Article Symbol Marking (EAN), write to:

Secrétaire General, E.A.N.
Rue Des Colonies 54, BTE 8
1000 Bruxelles, Belgique

For each 3687, the customer must provide a switchable on and off power outlet for a locking plug. A 1.8m (6 ft) power cord and locking plug will be shipped with each machine.

(Except Canada > For each 3687, the customer must provide a switchable on and off power outlet.

Refer to IBM 3650 PSS Installation Manual - Physical Planning, GA27-3167, or IBM 3680 Programmable Store System - Planning and Site Preparation Guide, GA27-3167, for requirements for mounting the 3687, both models, in a checkstand.

SPECIFY

- Voltage (AC, 1-phase):

50 Hz		60 Hz	
100V	#2804	100V	#2730
110V	#2805	120V	#2800*
200V	#2806		

MACHINES

220V #2813
230V #2821
240V #2801

*For Canada only, note that 120V AC 60 Hz is compatible with existing 115V systems.

Note: A 2.8m (9 ft) power cord and plug will be shipped with each machine from the plant of manufacture. The country code will be used to select a power cord and plug to the specifications most commonly used in that country. (Japan only > Specify #9890 for locking plug or #9891 for nonlocking plug (for either 50 Hz or 60 Hz, 100 Volts 1-phase).

- Machine Nomenclature:

Australian #2918	English US #2924
Canadian English #2934	Japanese #2930
Canadian French #2935	Spanish #2931

Note: #2918 must be specified in Australia in order to have a legally required laser warning sign attached to the scanner.

- Alternate Mounting System: Specify #9555. Refer to IBM 3650 PSS Installation Manual - Physical Planning, GA27-3167 for details.

SPECIAL FEATURES

(Canada, Japan only > Scratch-Resistant Window (FC #3005): (Mdl 2) Provides a scratch-resistant window

installed at time of original order. This window is intended to be permanently installed. Field Installation: No. Maximum: One. (Accessory (PN 7032261) Scratch - Resistant Window kit can be used for field installation on the 3687 Mdl 2 installed without Feature Code #3005.)

MODEL CONVERSIONS (None)**ACCESSORIES**

Scratch Resistant Window Kit (P/N 7032261): A scratch resistant window in an installation kit. Intended to be permanently installed by the user. User installable only. Replaces the expendable window with which the 3687 is equipped.

Window (P/N 1749143): The 3687 Mdl 1 (Canada, Japan only > Mdl 2 Checkout Scanner (Canada Japan only > , Mdl 2 without Scratch - Resistant Window (#3005), is equipped with a replaceable window. With use, it will get scratched and need to be replaced. Window replacement is a customer responsibility.

SUPPLIES

Contact your Country DP Supplies Coordinator. <SS> Contact IBM.

3689 STORE COMMUNICATIONS UNIT

PURPOSE

To provide communications for the 3650 Programmable Store System over (Canada only > PTT <)-supplied communications network facilities.

MODELS

Model 1 001

Prerequisites: A 3650 Programmable Store System with (minimum requirements):

- A 3651 Store Controller mdl A75, B75, C75, or D75 with the 4800 bps Loop Adapter (#4895) and the 3669/3689 Attachment (#8069).
- Access to an appropriate switched network communications facility.
- A store loop equipped with at least one 3683 Point of Sale terminal with 4800 bps specify feature #9430.
- Communications with any virtual storage S/370 or 4331 or 4341 processor via a properly equipped 3704 or 3705 or a Communications Adapter on a 4331.
- Communications with any virtual storage 4341, 4361, 4381, 303X, 308X or 3090 processor via a 3720 Communication Controller.

Customer Setup: The 3689 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. (Canada only > Switched Network transmit level switches must be set by the customer at setup time. <)

HIGHLIGHTS

The 3689 mdl 1 provides communications between a 3651 Store Controller mdl A75, B75, C75, or D75 and:

- The host S/370 or 4331 or 4341 processor via a 3864 Modem mdl 2 attached to a 3704, 3705 or 3725 Communications Controller with switched line features or a Communications Adapter feature on a 4331.
- The store loops at another predesignated store location via another 3689 mdl 1 at that location, to provide backup operation for the store in case its 3651 Store Controller mdl A75, B75, C75, or D75 is inoperative.
- The 3651 Store Controller mdl A75, B75, C75, or D75 via another 3689 mdl 1 in another predesignated store in a controller-to-controller operation via Auxiliary Communications Adapters (#6185) for the purpose of data transfer or data reconciliation when the backup operation is terminated.
- The host 4341, 4361, 4381, 303X, 308X or 3090 processor via a 3864 Modem model 1 attached to a 3720 Communication Controller and operating over switched lines.

Additional characteristics of the 3689 mdl 1 are:

- Operates in half-duplex mode over 2-wire switched telecommunication networks. Operating mode is point-to-point.
- A microprocessor for signal processing.
- Auto Answer: Automatic Answering of Switched Network calls.
- Automatic Speed Selection: The transmission speed of the 3689 mdl 1 follows the transmission speed (4800/2400 bps) of

the Host 3684 mdl. Note: There is no Automatic Speed Selection when loop communication is involved.

- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- When operating with a Host S/370 or 4331 or 4341 processor via a 3864 mdl 2, the modem diagnostic functions, referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
 1. Network Communication Control Facility (NCCF) Release 1 or 2 (5735-XX6)
 2. Network Problem Determination Application (NPDA) Release 2 (5735-XX8)
 3. ACF/NCP Release 2.1 (5735-XX1)

Diagnostics: Built-in diagnostics - The 3689 mdl 1 will respond to diagnostic commands from the Host system and provide its status and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 for data transmission. This diagnostic status/test requests can be interspersed with data requests without interrupting 3651 sessions.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem or modem interface.

NPDA will utilize the modem facilities to provide alert messages on error threshold and display formatted modem test results.

In addition, tests can also be executed from the 3689 operator panel. These manual tests include:

- Self-test -- this includes an extensive test of modem micro-code, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Lamp test -- tests all indicator lights on the operator panel.

Communication Facilities

Public Switched Networks: The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to M2700 pages for further details.

Privately-owned Communication Facilities: Equivalent to above.

International Facilities: Transmission of data between the United States and Canada on switched facilities is supported.

Attachment to Facilities: (Canada only > The cables supplied to attach the 3689 mdl 1 to the public switched network are terminated with spade lugs for attachment to a CBS type data coupler (WE1001A, series 5 or later, or WE1001F or equivalent). <)

Note: Telephone sets (handsets) are required with switched facilities at all 3689 mdl 1 locations.

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages, and in the site preparation section of the "3650 Programmable Store System Installation Manual - Physical Planning" (GA27-3167).

The customer is also responsible for:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Switched Telecommunication Network -- arranging for the telecommunication service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device. The customer must also inform the telecommunication service supplier that the rate of data transmission will be faster than 1200 bps.
3. If the 3689 is to be attached to a non-IBM product, the interconnecting cable between the business machine and the modem must be supplied by the business machine.
4. Unpacking and placing of the 3689, physical setup, and connection of cables at setup time.
5. Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
6. Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
7. All three of the following program products at the current release must be installed for LPDA to function between the Host and the 3689 mdl 1 if the customer requires the LPDA function.

NCCF (5735-XX6)
NPDA (5735-XX8)
ACF/NCP (5735-XX1)

8. Obtaining, installing and testing the store loops.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): #9890 for locking plug, #9891 for nonlocking plug. If standard 3.0m (10 ft) power cable is not required, specify #9986 for 1.8m (6 ft) cable.
- (Canada only > Language Groups: #2935 for Canadian French. If Canadian French (#2935) is not specified, English (#2924) will be provided. <)
- Telecommunication Cable (modem to telecommunication line): Specify #9710 for 3m (10 ft) (Canada only > cable, includes the interface to the external line coupler. The External Line Coupler is installed by the PTT. <)

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

3694 DOCUMENT PROCESSOR

PURPOSE

A programmable MICR Reader-Inscribe-Sorter for remote processing of documents used primarily in the Finance Industry. As a member of the 3600 Finance Communication System, the 3694 combines the programming and host communication facilities of the 3601 Finance Communication Controller with MICR document handling capabilities.

Can attach to S/370, 30XX, or 4300 processors via a 3705 or 3725 Communications Controller (to 4331 also via the Communications Adapter) using Synchronous Data Link Control (SDLC) transmission over various common carrier or user-owned transmission facilities.

Can attach to S/34, S/36 or S/38 Processors via communications adapter using Synchronous Data Link Control (SDLC) transmission over various common carrier or user-owned transmission facilities. Application support for S/34 is provided by the following Check Processing Executive/General Support FDPs, or user supplied programming. Document Control Section Edit (5798-RFL), Table Preparation Facility (5798-RFK), File Translation Facility (5798-RFJ), Communication Support Facility (5798-RKH) and Sort Preparation Facility (5798-RKG).

Can attach to 4341, 4361, 4381, 303X, 308X or 3090 processors via a 3720 Communication Controller using SDLC transmission over various common carrier or user-owned transmission facilities.

Application support for S/36 is provided by the following Check Processing Executive/General Support FDPs, or user supplied programming. Document Control Section Edit (5798-RFL), Table Preparation Facility (5798-RQX), File Translation Facility (5798-RQW), Communication Support Facility (5798-RQY) and Sort Preparation Facility (5798-RQZ).

Note: See "Programming" and "SCP" pages for attachment capability.

The 3262 models 3 and 13 or the 4234 model 1 line printers may be attached to a 3694 for high-speed report printing. The 3287 models 1 and 2, 3268 model 2 and 4224 model 2XX printers may also be attached for lower volume printing.

The 3694 is available in eight models: Models 1A, 1B, 1C and 1D and models 2A, 2B, 2C and 2D. They perform identical functions except that the model 2s have an automatic document feed and high-speed sorter path for program controlled sorting and/or data capture at up to 400 6-inch documents per minute.

Multiple 3694s can be attached to a given 3694 or to a 3602 Finance Communication Controller for data concentration and control.

MODELS

Model 1A A01 (NO LONGER AVAILABLE AFTER JANUARY 14, 1986): One Distribution Stacker Module - 6 pockets

Model 1B B01 (NO LONGER AVAILABLE AFTER JANUARY 14, 1986): Two Distribution Stacker Modules - 12 pockets

Model 1C C01 (NO LONGER AVAILABLE AFTER JANUARY 14, 1986): Three Distribution Stacker Modules - 18 pockets

Model 1D D01 (NO LONGER AVAILABLE AFTER JANUARY 14, 1986): Four Distribution Stacker Modules - 24 pockets

Note: Pockets are also known as Stackers.

All models include a compact diskette drive supporting Diskette 1 or Diskette 2, an operator console, a master list printer, a keyboard, MICR read and inscribe capability, a document correction station, item identification and numbering capability, an endorser, and approximately 81,000 bytes of user-programmable storage. User storage can be expanded, optionally, up to a maximum of approxi-

mately 113,000 bytes. A second compact diskette drive can also be added, optionally, providing an additional 270,000 or 568,000 bytes of storage, depending upon whether Diskette 1 or Diskette 2 is used.

Model 2A A02: One Distribution Stacker Module - 6 pockets

Model 2B B02: Two Distribution Stacker Modules - 12 pockets

Model 2C C02: Three Distribution Stacker Modules - 18 pockets

Model 2D D02: Four Distribution Stacker Modules - 24 pockets

All models also have a compact diskette drive supporting Diskette 1 or Diskette 2, an operator console, a master list printer, a keyboard, MICR read and inscribe capability, a document correction station, item identification and numbering capability, an endorser, approximately 81,000 bytes of user-programmable storage, plus an automatic feeding device and high-speed document path for operations at rates up to 400 documents per minute for 6-inch documents. User storage can be expanded, optionally, up to a total of approximately 113,000 bytes. A second compact diskette drive can also be added, optionally, providing an additional 270,000 or 568,000 bytes of storage, depending upon whether Diskette 1 or Diskette 2 is used.

HIGHLIGHTS

Combines document inscribing (E13B), reading, sorting, identifying and endorsing functions with data capture and storage accumulation, and communication capabilities under program control. Can communicate with a host system using any one of two SDLC communication features and an EIA Interface feature with an external modem, or by direct attachment to a 3705, 3720 or 3725 or 4331 or S/34 Communications Adapter or Communication Attachment on the S/38.

Houses a diskette drive which can accommodate 2-sided diskettes offering storage of user data and programs, i.e., sort table, all items file and cluster summary data.

Accommodates up to four Distribution Stacker Modules with each containing six distribution pockets. Each distribution pocket has a capacity of approximately 400 documents. Depending upon the mdl, a 3694 can have one, two, three or four such modules. Optional distribution list printers may be dynamically assigned under program control to individual pockets to list the contents of each pocket as the document enters, or on a deferred basis.

An optional microfilm feature is available to record images of documents processed on the full function path (mdls 1 and mdls 2) and documents processed on the sorter path (mdls 2). Film image format is duplex mode (front and rear of documents recorded adjacent to each other). Film record includes header data, item sequence numbers and frame marks (blips). An optional PAID stamp feature is available on 3694 mdls 2 for face cancelling items as PAID for items processed on the sorter path.

A 3694 mdl 2A, 2B, 2C or 2D is equipped with an automatic feed/high-speed path. It can capture data and fine-sort documents at a rate of up to 400 documents per minute (for 6-inch documents).

The 3262 (mdls 3 and 13), 3287 (mdls 1 and 2), 4224 (mdl 2XX), and 4234 (mdl 1) printers 3268 (mdl 2) may be attached to offer, with appropriate programming support, an ability to print host, diskette or program-supplied print line images.

Clusters of up to four 3694s may be attached to another 3694 for communications concentration and control. Depending upon the applications and operational considerations, up to 18 3694s may be attached to a 3602 Finance Communication Controller for large cluster concentration and control. (For attachment of more than eight 3694s to a controlling 3602, Systems Assurance approval is required.)

Transmission: The 3694 can operate over common carrier-provided or equivalent customer-owned facilities. For information concerning these facilities, see the M2700 pages.

Modems: External modems operating at up to 9600 bps may be attached when used with SDLC feature #4502. For information concerning modem attachment support, see the M2700 pages.

Prerequisites: If Host connected - a communications controller with appropriate features -- see M3705, 3720, 3725 or 4331 (for Communications Adapter #1601 on the 4331), 5340, 5360, 5362 or 5381 pages.

Bibliography: GC20-0370, IBM S/370 Bibliography, and GC27-0001, "IBM 3600 Finance Communication System, System Summary".

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (1-phase, 60 Hz): All machines will be shipped for 208V service. If necessary the IBM customer service representative can convert machines to 240V service at customer location.
 - Machine Nomenclature (Canada and Japan only): Canadian French #2935, Japanese #2930.
 - Power Cord: Select appropriate length power cord, and specific type of cord.
 - 1.83m (6 ft) cord, specify #9986 with
#2742, locking plug (L6-20P), for Canadian machines (all other countries shipped without plugs).
 - 4.27m (14 ft) cord, specify #9987 with
#2742, locking plug (L6-20P), for Canadian machines (all other countries shipped without plugs).
 - Controller Designation: Media distribution of controller data. Specify #9491 to identify the initial controller (3601, 3602 or 3694) ordered for use with a host system location, or specify #9492 to identify additional controllers (3601, 3602 or 3694s) per host system. #9491 should only be ordered when host media DTR tape containing microcode is required. If a pre-configured diskette is specified when ordering the CHX/3694 Application Program Product (PP 5748-F53), then specify #9492 for the controller designation.
- When the initial controller is a 3694, at least one of the following specify codes (#9493, #9494 or #9495) is required:
- If the initial controller (with specify #9491) is a 3694, and if there is a 3614 with a first position designator and a specify #9002 attached to any 3601 or 3602 on the same host system, then specify #9493 is required.
- If the initial controller (with specify #9491) is a 3694, and if there is no 3614 or 3624 with a first position designator attached to any 3601 or 3602 on the same host system, then specify #9494 is required.
- If the initial controller (with specify #9491) is a 3694, and if there is a 3614 with a first position designator and a specify #9001, or a 3624 with a first position designator attached to any 3601/3602 on the same host system, or if encryption capability via the data encryption standard (DES) is desired on a 3601 or 3602 on the same host system, then specify #9495 is required.
- If #9491 is specified, select the specify number of the desired media:

#9412 9/800 Magnetic Tape
#9413 9/1600 Magnetic Tape
#9414 9/6250 Magnetic Tape

If magnetic tape is not available on designated CPU, then select one of the following media (DOS/VS or VSE users only):

#9431 80-column cards
#9432 96-column cards

If card or tape inputs are not available at the host location, contact Finance Industry Marketing for guidance.

When feature #9491 is specified, additional shipping information is required.

Supplement Spec (via DPMO entry) is to be entered exactly as follows to indicate shipping address of the Host System location:

Line 1 -- IBM Programming Support Representative (PSR)
Line 2 -- c/o (Name of customer)
Line 3 -- Street address (or P.O. Box)
Line 4 -- (etc.) -- City, Province, Postal Code

This is the address to which the first controller (3601, 3602 or 3694) data tape will be automatically shipped for the first controller ordered (with specify #9491). Whenever controller data is updated by an EC, it will be shipped to the most current MC address.

- Typical Configuration Guideline: As a reference, the most typical 3694 featured machine configuration is as follows:

- 3694 mdl 2B - Base machine with 12 pockets and Autofeed/Sorter path
- #1015 - Additional diskette storage
- 2X #3201 - Two distribution list printers
- #3701 - EIA Interface
- #4502 - SDLC communication without clocking

Other features commonly ordered are:

- #5121 - Microfilm
- #5450 - PAID Stamp

Required Specifies must also be ordered.

The following is a more detailed guide to configuring specific 3694 machines. It is based upon the operational diskette levels provided by the IBM 3694 application program product, CHX/3694 (PP 5748-F53):

Basic 3694 Configuration: Basic 3694, when ordered with specify software feature code #9145. This configuration is for 3694s which communicate directly with S/370, S/34, S/36, S/38 or 4300 processors. This configuration also applies to a 3694 which is attached to another controlling 3694 or 3602 controller (clustered configurations).

Basic with Concurrent Remote Print Configuration: Basic with Concurrent Remote Print, when ordered with specify software code #5245. This configuration is for 3694s that communicate directly with S/370 or 4300 processors. Concurrent check processing and report printing can also be accomplished with this configuration.

Cluster Controller 3694 Configuration: Cluster Controller 3694, when ordered with specify feature code #9245. This configuration is for 3694s which communicate directly with S/370 or 4300 processors, and have other 3694s attached for concentration and control.

Stand-Alone 3694 Configuration: Stand-Alone 3694, when ordered with specify software feature code #9445. Data is exchanged with the host by exchanging diskettes. The pre-configured diskette (CHX/3694) will have no communications application code but will provide the logic necessary to support diskette interchange.

Required Features/Models

Application/Use	Stand-Alone 3694	Basic 3694	Basic 3694 with Concurrent Print	Cluster Controller 3694
Software Feat. Code	#9445	#9145	#5245	#9245
Communication to host through modem which does not have internal clocking, or for direct attachment to 3705 or 3725 at speeds of 1200 or 2400 bps.	--	#3701 and #4501	#3701 and #4501	#3701 and #4501
Communication to host through modem which has internal clocking speeds up to 9600 bps. to 4331 Communication Adapter without modems. S/34 Communication Adapter or to controlling 3694 or 3602 without modems.	--	#3701 and #4502	#3701 and #4502	#3701 and #4502
Additional storage requirements	--	--	#1007, #9602	#1007, #9601 and #1007, #9602
Cluster control	--	--	--	#1015, #4401
Attachment of printers (See note below)	#3101	#3101	#3101	#3101
Additional disk storage for increased MICR item data storage.	#1015	#1015	#1015	--
In-line Microfilming.	#5121	#5121	#5121	#5121
Paid Stamping (mdl 2 only)	#5450	#5450	#5450	#5450
Printing of pocket distribution list:				
- Typical application uses one printer per six stacker/pockets.	#3201 (mult)	#3201 (mult)	#3201 (mult)	#3201 (mult)
High-speed sorter path:				
- Typical application uses twelve or more pockets (mdls 2B, 2C or 2D).	Mdl2s	Mdl2s	Mdl2s	Mdl2s
Pocket-full lights:				
- Typical application uses one such feature per six stacker/pockets.	#5540 (mult)	#5540 (mult)	#5540 (mult)	#5540 (mult)

Note: Printer mdl description (Not for use with S/34, S/36 and S/38 host systems):

3262-13 325 lpm
 3262-3 650 lpm
 3287-1 80 cps
 3287-2 120 cps
 3268-2 340 cps
 4224-2XX 200/400 cps (Non-IPDS Mode)
 4234-1 300 lpm

- Cables: See "Accessories" for ordering instructions for 3262 or 3237 printer cables. Communication cables for the 3694 are provided without charge when feature #3701 (EIA Interface) is ordered through the normal WTAAS procedure. Also see Installation Manual - Physical Planning, GC31-2010.

- Frames: The number of frames for shipping purposes will be determined by the manufacturing plant based on the specific mdl and configuration ordered. See the "3694 Document

Processor Installation Manual - Physical Planning", GC31-2010, for details.

- #9580 to request shipping by air (required for areas outside Canada and the Continental U.S.). All air shipments are in three frames (four, if a 3- or 4-stacker module configuration is ordered, mdls C and D).

If air shipment is required within the Continental U.S. or Canada, the branch office must send a request for premium transportation to the IBM Charlotte plant of manufacture (form #625-3433-01).

- #9481 for system operation without host CPU, host 3694, or host 3602 attachment.

Note: MANDATORY for all orders without hosts.

- Tool Kits: Required for CE Maintenance. For Rental Customer -- specify on first 3694 order for each customer site. If required for multiple machine sites, an additional Tool Kit(s) is available on a no-charge MES. For Purchase Customers -- specify on each 3694 order. When installed rental 3694s are purchased, a Tool Kit is to be ordered on a no-charge MES for each machine. Specify #9766 for Base Machine Service tools.

Specify #9441 for microfilm feature service tools. The microfilm tool kit consists of a 3694 microfilm cassette, a set of test documents, and a roll of film. Individual microfilm tool kit parts are available from Mechanicsburg.

SPECIAL FEATURES

Non-Communication Features

Add'l Storage (#1007): Provides an additional 32,768 bytes of control storage or additional 32,768 bytes of user-programmable storage. Specify #9601 for control storage; it is required to run software feature code #9245. Specify #9602 for user storage; it is required to run software feature code #5245 or software feature code #9245. A maximum of one additional storage feature for control storage (#9601), and a maximum of one additional storage feature for user programming (#9602) may be ordered for a 3694 mdl 1 or 2.

Auxiliary Compact Diskette Drive (#1015): The Auxiliary Compact Diskette Drive supporting Diskette 1 and Diskette 2 provides an additional storage capacity of approximately 270,000 or 568,000 bytes. No area on the auxiliary (or secondary) drive will be reserved for the control program. Maximum: One. Field Installation: Yes.

Note: Support for feature #1015 is provided by Extended Diskette Access Method (EDAM) Base, EDAM Allocate/Deallocate (LDKT instruction), and EDAM Temporary File Support. Refer to "Device Attachment Factors Table" and "Attachment Factor Functions" section.

Device Cluster Adapter (DCA) (#3101): Permits attachment of any combination of one or two 3262 (mdls 3, 13), 4224 (mdl 2XX), 4234 (mdl 1), 3268 (mdl 2) or 3287 (mdls 1, 2) printers to a 3694. Limitations: Maximum distance from 3694 to terminal is 1,500m (4,920 ft). Not for use with S/34, S/36 and S/38 host systems. Note: Attachment of two printers requires Systems Assurance Review. Maximum: One. Field Installation: Yes.

Distribution List Printer Module (#3201): The Distribution List Printer (DLP) prints two distribution lists, each containing up to 18 characters per line. Independent paper movement allows either list, or both, to be printed at up to 180 lines per minute. Each list is dynamically assignable to distribution pockets to print, under program control, data from, or relative to, documents selected to corresponding distribution pockets. Maximum: Six distribution list printers (for up to 12 distribution lists) may be ordered per 3694. The maximum is dependent upon the number of Stacker Modules. Field Installation: Yes. One "Drawer Position" is available in the base of each of the first three stacker modules for installation of distribution list printer drawers. Drawers can contain one or two distribution list printers (providing 2 or 4 distribution lists).

The positioning options of the distribution list printers modules is as follows, and is predetermined by the quantity ordered:

	Stacker Module						
	1	2	3	4			
Position	1A	1B	2A	2B	3A	3B	N/A
	N/A = Not available						

Quantity of Printers Installed	Required Positioning of Installed Printers
--------------------------------	--

1	1A
2	1A, 1B
3	1A, 1B, 2A
4	1A, 1B, 2A, 2B
5	1A, 1B, 2A, 2B, 3A
6	1A, 1B, 2A, 2B, 3A, 3B

When ordering additional distribution list printer modules for field installation, the next sequential position must be ordered in accordance with the chart above. The position(s) must be indicated by the following specify code(s):

Position	Specify
1A	#9101
1B	#9102
2A	#9105
2B	#9106
3A	#9109
3B	#9110

Controller Attachment (#4401): Required to attach up to four 3694s to a controlling 3694 at a link speed of 9600 bps. This feature is required in the controlling 3694 only. Limitations: Attached 3694s must each be placed within 100 cable-feet of the controlling 3694.

Note: Support for feature #4401 is provided by Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1, and SDLC/SNA Attachment Part 2. Refer to "Device Attachment Factors Table" for the 3694. Maximum: One. Field Installation: Yes.

Microfilm (#5121): Provides for filming front and rear of documents processed on 3694 mdls 1 and mdls 2 in duplex format (front and rear of item recorded adjacent to each other on film). Item sequence number is recorded (exposed) on film for every other item filmed. Frame marks (blips) are recorded on film for each item filmed. Indicative data can be recorded on film as header film records. Minimum image resolution is 110 lines per millimeter. Camera reduction is 50:1. Users specify that microfilming is active on a 'per-run' basis. Rated filming speed is the same as processing speed for the mdl 2 sorter path (400 documents per minute for 6-inch documents). A film cassette to house the film supply and film take-up reel is provided with the feature. Additional film cassettes can be ordered from "Accessories" below. The microfilm feature uses 16mm, medium- to high-speed, unperforated film, and can accept either 100-ft (thick-base) or 215-ft (thin-base) film supply reels. Capacity of film is approximately 13,300 items (front and rear) per 100 feet of film. Maximum: One. Field Installation: Yes.

Note: A CE microfilm tool kit is required to install this feature. Refer to "Tool Kit" description under "Specify" for ordering information.

Paid Stamp (#5450): Provides for face cancelling items as PAID on 3694 mdl 2 only. Stamping mechanism is located on sorter path of mdl 2s and is activated on a user-specified 'per-run' basis. At least one full stamping of the word PAID will appear on each document, and additional partials may also appear. Limitations: 3694 mdl 2s only. Maximum: One #5450 per 3694 mdl 2s. Field Installation: Yes. Prerequisites: #5121.

Stacker Lights (#5540): This feature provides six individual pocket lights per Stacker Module which may be installed on any Module as required. An individual light on a pocket illuminates when a pocket

is approximately three quarters full. The light is switched off when the pocket is cleared. If the transport has stopped due to a full pocket, the operator must restart via the green start button. Limitations: Can only be installed on machine serial number 10023 and above. Maximum: One per system. Field Installation: Yes. Prerequisites: Specify #9501 on Stacker Module 1; #9502 on Stacker Module 2; #9503 on Stacker Module 3; #9504 on Stacker Module 4.

Control Storage (#9601): This feature is required to run software code #9245. Used for attachment of certain device types, functions, and features which have associated attachment factors. See "Device Attachment Table" below. Some combinations of device types, functions, and features can be accommodated with no additional control storage. Other combinations require additional control storage as provided by the Add'l Storage feature #1007 with the Control Storage specify #9601. Refer to Attachment Factor Functions and Device Attachment Table sections for a further explanation of attachment factors and required control storage. Maximum: One. Field Installation: Yes.

User-Programmable Storage (#9602): This feature is required to run software feature code #9245 or #5245. Used for the instruction sections of application programs and a limited amount of configuration data and application program constants. Most configuration data and application program constants cannot reside in this additional user-programmable storage. Maximum: One. Field Installation: Yes.

Communications Features

For operation without attachment to either a host processor or a controlling 3602 or 3694, specify #9481 must be used.

For communications with a controlling 3602 or 3694, each attached 3694 must be equipped with the EIA Interface (#3701) and the SDLC Communications Feature without Business Machine Clocking (#4502).

For communications with a S/370, S/34, S/36, S/38 or 4300 series host processor, each 3694 must be equipped with one of the following SDLC features and the EIA Interface (#3701).

EIA Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external IBM modem for communications to the host processor through the 3704, 3705 or 3725 the Communications Adapter (#1601) feature on the 4331 Processor; or the Communication Adapter on the S/34, S/36 or the appropriate system communication features on the S/38; or for direct local attachment to the 3705, 3725 4331 Communications Adapter or a controlling 3602 or 3694 without requiring modems; see M3602, 3705, 3725 (#4716), 4331, 5340, 5360 or 5381 pages. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. Maximum: One. Field Installation: Yes. Cable length from this feature to the controlling 3602/3694 cannot exceed 30.4m (100 feet). Cable length for attachment to an external modem cannot exceed 8.1m (20 feet). See the "3694 Installation Manual - Physical Planning", GC31-2010, for details. Prerequisites: #4501 or #4502.

SDLC Communications With Business Machine Clocking (#4501): Required for attachment to communication lines through the EIA Interface (#3701) at 1200 bps or 2400 bps with any external modem which does not have internal clocking, or for local attachment to a 3705 or 3725 Communications Controller at 1200 or 2400 bps (feature #4716). Limitations: Cannot be installed with #4502. Maximum: One. Field Installation: Yes.

SDLC Communications Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which does have internal clocking at speeds up to 9600 bps or for local attachment to a 4331, S/34 or S/38 Communications Adapter without Modems. It is also required in 3694s which attach to a controlling 3694 or 3602. Limitations: Cannot be installed with #4501. Maximum: One. Field Installation: Yes. Prerequisites: #3701.

Note: SDLC as used in the 3694 Document Processing system conforms to a subset of both the ISO HDLC and NASI ADCCP Standards. For details of the conformance, see IBM Synchronous Data Link Control General Information Manual, GA27-3093-2.

DEVICE ATTACHMENT FACTORS

Attachment Factor Information

A 'base' attachment factor capability of 26 and an 'expanded' attachment factor capability of 24 is standard on all mdls of the 3694. An 'expanded' attachment factor capability of 49 can be obtained by adding feature #1007 with specify #9601.

To determine if feature #1007 with specify #9601 is required, the attachment factor for each device type, function, or feature required must be allocated, one time only, against either the 'base' or the 'expanded' attachment factor sum, but not both. (The 'base' and 'expanded' attachment factor sums must be calculated separately.)

The 'base' attachment factor sum may not exceed 26. If the 'expanded' attachment factor sum is 24 or less, feature #1007 with specify #9601 is not required. If the 'expanded' attachment factor sum is greater than 24, but does not exceed 49, feature #1007 with specify #9601 is required. An 'expanded' attachment factor sum of greater than 49 is not allowed. Maximum: One. Field Installation: Yes.

Device Attachment Table: In the following table, attachment factors in the column labeled BASE are applicable to the 'base' attachment factor calculation only. Attachment factors in the column labeled BASE OR EXPANDED are applicable to either the 'base' or 'expanded' attachment factor calculation.

The 3694 loads support for devices/features into control storage in the sequence indicated by the following table. The 3694 will always attempt to load each device or feature into 'base' control storage. If a device or feature is encountered that will not fit into 'base' control storage and it is applicable to 'expanded' control storage, the controller will load it into 'expanded' control storage if space is available.

Refer to the "IBM 3694 Document Processor Description and Configuration", GC31-2009, for a comprehensive list of attachment factors and additional information regarding calculation of base and expanded attachment factors.

A description of attachment factor functions not associated with a specify, machine or feature is given later in this section. See "Attachment Factor Functions".

Device Attachment Factors Table

Device Type/ Feature/Function	Attachment Factor	
	Base	Expanded
3694 Operator Console	2.8	
SDLC (#4501 or #4502)	0.7	
Multiple Block I/O		
- Diskette	3.0	
Optional		
Instruction Locator	0.3	
Instruction Enhancements	1.7	
3694 Document Processor		
Base (Note 1, 4)		21.5
Alternative Line		
Attachment Base (Note 3)		5.4
Dynamic Control (Note 5)		1.5
SDLC Link Diagnostics		
(Note 3)		0.8
SDLC/SNA Attachment		
Part 1 (Note 3)		8.0
SDLC/SNA Attachment		
Part 2 (Note 3)		5.8
Device Cluster Adapter		
(Note 2)		5.0
LSEKP Instruction (Note 1)		1.8
Translate Instruction		

MACHINES

(LTRT) (Note 1)	1.2
Data Decompression/ Decompaaction (Note 1)	1.2
Data Compression/ Compaction (Note 1)	1.6
SCRPAD Instruction (Note 1)	1.7
Priority Dispatching (LCHAP) (Note 1)	0.3
Data Sequencing	1.6
Extended Statistical Counter Recording (Note 1)	1.3
Extended Diskette Access Method (EDAM) Base	5.5
EDAM Allocate/Deallocate (LDKT Instruction) (Note 6)	1.7
EDAM Temporary File Support (Note 7)	1.5
3262/3287 Part 1 (Note 2)	3.0
3262/3287 Part 2 (Note 2)	1.5
Set Diskette	0.9

Notes

1. The Optional Instruction Locator must be included if this function is used. If more than one function requiring the Optional Instruction Locator is used, the attachment factor for the Locator need be included only once.
2. The device cluster adapter, 3262/3287 Part 1, and 3262/3287 Part 2 must be included if a 3262 and/or 3287 is used.
3. The Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1 and SDLC/SNA Attachment Part 2 together comprise the SNA Primary interface support required in the controlling 3694 for controller-to-controller (3694-to-3694) communication via an SNA/SDLC interface. When used, these functions must all be loaded into the same controller storage (i.e., base or expanded). This SNA primary function is used in conjunction with the controller attachment feature (#4401).
4. The 3694 Operator Console function must be included if the 3694 Document Processor Base function is included.
5. The Alternative Line Attachment Base must be included and loaded into the same controller storage (i.e., base or expanded) if Dynamic Control is used.
6. The EDAM Base must be included if the Allocate/Deallocate function is used.
7. The EDAM Base must be included if EDAM Temporary File Support is used.

ATTACHMENT FACTOR FUNCTIONS

Data Sequencing: Allows user applications to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

Extended Statistical Counter Recording: Allows user applications, via the STATS instruction, to access the basic statistical counters of the 3694 and attached devices.

Set Diskette: Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

Instruction Enhancements: Provides the user application with the following instructions:

- Bit Manipulating - Test and Branch (LIFON, LIFOFF) -- provide a test, set and branch function in a single instruction. This reduces the 3600 AP processing and memory requirements when processing single bits.
- Logical Compare Data Immediate (CCDI) -- compares immediate data to data in a specified field.

- Move Data Immediate (MVDI) -- moves immediate data to a specified field.
- Load Data Immediate (LDDI) -- loads immediate data into specified register.
- Scale -- formats an input string of characters into a conveniently processable numerical format. When used in processing monetary input, functions such as the removal of the monetary symbol, commas, and periods from the input data are automatically done. In the event that cents were not in the input data, zero padding is optionally provided. Scale should significantly reduce the number of instructions required to process monetary input.
- Segment Indexing (SETX, TESTX, SETXREG) -- provides an alternate method of referencing data within a segment. Only fixed operands of 3600 instruction may be indexed. This function can be used to reduce the number of SETFPL instructions executed by the AP, thereby enhancing performance and reducing AP size. This function also provides a pseudo DSECT facility, thereby enabling an AP to more readily reference: (1) Variably displaced data within segments and/or (2) data beyond 4K bytes from the beginning of a segment.
- Branch on Index (BRANX) -- provides an index increment, compare and branch function in a single instruction. This instruction is used to control the number of times a series of AP instructions will be executed. Since the instruction algebraically increments a register, BRANX can be used in conjunction with the Segment Indexing facility to simplify the processing of tables.
- Execute (LEXEC) -- provides a function similar to the S/370 EXECUTE instruction. The amount of data logically ORed into the target instruction may be 2, 4 or 6 bytes.

Priority Dispatching: Provides the ability to dynamically specify the order in which controller workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP configuration macro.

Translate: The LTRT instruction processes an input data stream against user-specifiable translate table(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).

Multiple Block I/O - Diskette: Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than three blocks are read or four blocks are written.

Data Compression/Compaction: This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently-occurring characters according to a user-defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.

Data Decompression/Decompaction: This function allows a controller application program to decompress and/or decompact a data stream which had previously been compressed and/or compacted by a host or a controller application program.

Extended Diskette Access Method (EDAM) Base: Provides the capability to open, access and close data sets on the primary or auxiliary diskette drive.

EDAM Allocate/Deallocate (LDKT Instruction): Provides, via the LDKT instruction, capability to allocate and deallocate data sets in either the primary or auxiliary diskette drive.

EDAM Temporary File Support: Permits processing of a data set defined with a temporary file structure on the auxiliary diskette drive.

Dynamic Control: Provides additional LCNTRL instruction functions to assist in controlling access to devices attached to the 3694 through the SNA Primary interface.

LSEKP Instruction: Locates a table entry which is 'equal to', 'greater than or equal to', or 'less than or equal to' a search argument using a binary search algorithm. Tables may be included in the instruction section of the controller application program.

SCRPAD Instruction: Provides access to optional global work areas distinct from segment storage.

MODEL CONVERSIONS

3694 model 1s shipped beginning November 13, 1982 can be field upgraded to model 2s. Model 1s shipped prior to November 13, 1982 cannot be upgraded to model 2s but model 2s cannot be field-changed to model 1s. Model 2s can be changed to model 1s at time of manufacture only. Model suffix upgrades and downgrades (e.g., 1A to 1B, 2A to 2B, 1B to 1A, 2B to 2A, etc.), can be field-changed.

ACCESSORIES

Belts - Ink Roll - Ribbons: These accessories may be purchased from IBM or a customer-selected source. Order via MES from plant of manufacture. Allow a lead time of 120 days.

7032508 - MLP/PLP Ribbon-Purple (No Longer Available)
7032552 - MLP/PLP Ribbon-Blue/Black (No Longer Available)
7032505 - MLP/PLP Ribbon-Black
423654 - Endorser Ink Roll-Black
7034365 - ID Printer Ribbon Assembly
7032878 - MICR Ribbon
7032759 - Restraint Belt
7032760 - Picker Belt
7032761 - Feed Drum Belt
7032763 - Read-Head Belt

Cables: Cables are provided without charge when EIA Interface (#3701) is ordered. Detailed information about these cables is provided in "IBM 3694 Document Processor Installation Manual - Physical Planning", GC31-2010. See the 3287, 4224, 4234, or 3262 Printers Accessories section for cable attachment to the 3694. Effective April 1, 1984, communication cables and attachment cables will be shipped with the machine. If the 3694 is to attach to or communicate directly with a host system, then #9201 must be specified. The cable will be 40 ft. long. Shorter cable lengths may be ordered by ordering cable group 0681 in lieu of specifying #9201. Allow eight weeks for orders. Field Installation: Yes. Prerequisites: #3701.

If the 3694 is ordered for attachment to another 3694 via the controller attach feature (#4401) then #9202 must be specified. This cable will be 50 ft. long. Shorter or longer cables up to 100 ft. in length may be ordered by ordering cable group 3684 in lieu of specifying #9202. Field Installation: Yes. Prerequisites: #3701.

Microfilm Cassette - MES Orders (P/N 5682436): This cassette provides space for both microfilm supply reel and take-up spool. Cassette utilizes standard 16mm supply reels (100-foot or 215-foot film length). Cassette includes one take-up spool.

Note: A single cassette is provided with the ordering of the microfilm feature (#5121).

Documents: E13B magnetic characters, print quality and code line arrangement on the documents must meet the specifications recommended by the American Bankers Association. Intermixed paper and card documents within the following specifications can be processed:

Length: 146.05 to 225.4mm (5.75 to 8.875 in.)
Width: 66.68 to 107.95mm (2.625 to 4.25 in.)
Document Thickness: 0.09 to 0.14mm (0.0035 to 0.0055 in.)

Carrier Envelope: Carrier envelopes containing mutilated documents should not exceed total thickness of 0.356mm (0.014 in.).

Note: The use of carrier documents may cause a higher than normal jam stop frequency. Base Weights: 75 to 120 grams per square meter (basic weight is the weight of 500 sheets of 17 in. x 22 in. paper), 20 to 32 pounds. Standard column card stock may also be processed (must meet ABA RS-147-R3 specification).

Note: Insertion of an occasional 16 pound document is allowed. Insertion of concentrations of 16 pound documents is not recommended.

Grain: Preferably long grain.

SUPPLIES

To ensure that consumables are on-hand when the 3694 is shipped and received at the installation, care should be taken to have the customer submit an order to your DP Supplies Coordinator for 3694 supplies well ahead of installation time. Customer Responsibilities: The customer is responsible for changing all consumable supplies listed above. If the customer desires to have an IBM CE replace or install any of the consumable supplies, the CE time involved will be billed to the customer. Special note should be taken of Section 5, Belts; the customer must be informed of the need to keep spares on hand and have his operators trained in their replacement.

Consult your DP Supplies Coordinator for information regarding the following consumable supplies required for the 3694:

1. Diskettes:

Diskette 1 (128 Bytes) P/N 2305830
Diskette 2 (128 Bytes) P/N 1766870
Diskette 2 (256 Bytes) P/N 2736700

2. Ribbons: Note: Ribbon inks for the Master List Printer and Distribution List Printer ribbons are formulated to minimize printer wire damage.

Master List Printer Ribbons:

Ribbon - Purple P/N 7032508 (No Longer Available)
Ribbon - Blue/Black P/N 7032552 (No Longer Available)
Ribbon - Black P/N 7032505

Distribution List Printer Ribbons:

Ribbon - Purple P/N 7032508 (No Longer Available)
Ribbon - Blue/Black P/N 7032552 (No Longer Available)
Ribbon - Black P/N 7032505

Sequence Number Printer Ribbon Assembly:

Ribbon Assembly P/N 7034635

MICR Ribbon:

MICR Ribbon P/N 7032878

3. Endorser and PAID Stamp Ink Rolls:

Black P/N 423654

4. Endorser Plates: Endorser plates are made to the customer's specifications. See your DP Supplies Coordinator for ordering procedures and prices.

5. Belts:

Restraint Belt P/N 7032759
Picker Belt P/N 7032760
Feed Drum Belt P/N 7032761
Read-Head Belt P/N 7032763

6. Vacuum Cleaner Supplies:

Vacuum Bags P/N 7032219

7. Microfilm Lamps:

Package of 4 Lamps P/N 7032252

8. 3694 Customer Convenience Kit: P/N 7032998

Starter Supply Kit, approximately 6 months supply of all consumables. See your DP Supplies Coordinator for details.

9. Paper Specifications:

Master List Printer:

Single-part Fan Fold P/N 7034710
*Width: 89mm +/- 1mm (3.5 in.)
Weight: 16 lb Bond
Length of Fold: 140mm (5.5 in.)
Number of Folds/Pack: 500

Master List Printer:

Double-part Roll P/N 7034713
*Width: 89mm +/- 1mm (3.5 in.)

Weight: 16 lb Bond
Max. Dia.: 83mm (3.27 in.)
Thickness: 0.07-0.20mm (max.) (0.0028-0.0079 in.)

Distribution List Printer:

Single-part roll (only) P/N 7034712
*Width: 44.5mm +/- 0.5mm (1.75 in.)
Weight: 16 lb Bond
Max. Dia.: 83mm (3.27 in.)
Thickness: 0.07-0.20mm (max.) (0.0028-0.0079 in.)

* Use of paper less than 88.9mm (3.5") wide on the MLP and 44.45mm (1.75 in.) wide on the DLP may damage the print mechanism.

Paper Roll Core: Paper sensing mechanisms require that the core of the paper roll have an inside diameter of 11.10mm +/- 1.01mm (0.437 in. +/- 0.04 in.) and an outside diameter of 22.25mm +/- 1.01mm (0.875 in. +/- 0.04 in.).

3704 COMMUNICATIONS CONTROLLER

Note: All Models, RPQs, Special Features and Accessories are NO LONGER AVAILABLE -- Model changes will be withdrawn at a later time.

The 3704 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Cntl	Max* Line	Max Stor	Host Program	Comm Cntl Program
3704	32	64K	BTAM	EP
3705	255	512K	BTAM	EP
-II	352	512K	VTAM/TCAM	ACF/NCP-PEP
3505	16	256K	VTAM/TCAM	ACF/NCP-PEP
-80	16	256K	BTAM	EP
3725	256	1024K	VTAM/TCAM	ACF/NCP-PEP
-1			BTAM	EP
3725	24	512K	VTAM/TCAM	ACF/NCP-PEP
-2			BTAM	EP

* Maximum lines that can physically attach, CF3705 is required to determine actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

PURPOSE

The 3704 attaches to any S/370, 30XX, 4300 Processor, or in 2701/2702/2703 Emulation Mode only, to S/360 models 30 (submodels E or F), 40, 50, 65, 67 (in 65 mode), 75 and 195 for communication with local or remote I/O devices over various common-carrier provided or customer-owned communication facilities.

Note: See "Programming" and "SCP" pages for attachment capabilities.

MODELS

The 3704 is available in four models:

Model	Storage (bytes)	Maximum Comm Lines
A1 A01	16K	32
A2 A02	32K	32
A3 A03	48K	32
A4 A04	64K	32

Prerequisites: The 3704 requires a control unit position on a processor's Byte Multiplexer Channel. See the machine pages of the processor to which the 3704 will attach.

HIGHLIGHTS

The 3704 is a modular, programmable unit which greatly expands the communications capabilities of S/360, S/370, 30XX, 4300 Processors. By virtue of its modularity and programmability, the 3704 boasts a high degree of flexibility in tailoring to a teleprocessing system's requirements.

The 3704 is housed in a 36x24x57-inch cabinet which contains the Central Control Unit (CCU), the Control Panel (CP), storage (as indicated above), a Channel Adapter (CA), a Communication Scanner (CS), Line Interface Bases (LIB), and Line Sets (LS) to allow attachment of up to 32 communications lines.

The maximum number of communication lines attachable is a function of the speed of the lines, the CS installed and the mode of operation. An APL Configurator is available to assist in configuring the 3704 to the requirements of a specific TP network.

Customer Responsibilities: See the M2700 pages. Also see the 3704/3705 Programming pages for attachment capability, and the host systems programming pages for possible restrictions to the above.

3704 Configuration

Standard	Special Features
C C U E O N N N I T T T R R A O L L and C U O N N I T T R O L Stor vars w/ 3704 mdl	Channel Adptr Type 1 (#1541) Two Channel Switch (#8002) Expan Feat (#3006) Note 1 Comm Scan Type 2 #1642 w/o Comm Scan Exp #9090 Bus Mach Clock (#4650) Note 2 Comm Scan Type 1 #1641 or Comm Scan Type 2 (#1642) w/Comm Scan Exp (#9090) LIB in Pos 1 Line Sets TO SYS ATTACH TO COMM LINES

Notes:

- Required for mdls A2, A3 and A4, or CS Type 2 (#1642) on mdl A1.
- A minimum of one Business Machine Clock (#4650) is required. See "Special Features".

Communication Facilities: The 3704 operates over or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

3704 Local Attachment (Start/Stop): In addition to terminals being attached to the 3704 through PTT-provided facilities, they may also be connected directly to the 3704 using LS Type 1C (#4713). The cable groups selected from the Physical Planning Manuals or the device must have the 25-pin data set interface. LS Type 1C (#4713) allows only two terminals to be attached; one per 3704 25-pin data set interface. There must be corresponding Business Machine Clocks (BMC) in both the terminal and the 3704.

3704 Local Attachment (Synchronous): In addition to the synchronous terminals being attached to the 3704 through facilities, they may also be connected directly to the 3704 using LS Type 1F #4716. The cable groups selected from the Physical Planning Manuals for the device must have the 25-pin data set interface. LS Type 1F #4716 allows only two terminals to be attached; one per 3704 25-pin data set interface. There must be corresponding BMCs in both the terminal and the 3704.

3704 Line Interface Bases: Communication lines are attached to the 3704 through 'LIBs', of which there are several different types, to accommodate the various types of line terminations. Depending on type, these LIBs will house from one to eight "Line Sets" each, which will allow the attachment of from one to 16 communication lines. The 3704 will accommodate a maximum of two of these LIBs, allowing up to 32 lines to be attached. Note: The LIB position in the 3704 must be specified. See "LIB Position Designator" following special feature #1642.

Publications: S/360 -- GC20-0360; S/370 -- GC20-0001.

SPECIFY

- Power (AC, single phase): Not recommended for Field Conversion.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
200V #2806	200V #2732
220V #2813	208V #9902
235V #2814	230V #9904
- (Japan only > Specify #2747 to satisfy power requirements. <)
- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white. Field Installation: Not recommended.
- Prior to submitting an MES order, the Branch Manager should be consulted for any software/hardware compatibility requirements resulting from order.
- Cabling: Specify #9080 for below floor, or #9081 for on the floor.
- Language Groups:

English #2927	Japanese #2930
French #2928	Spanish #2931

Communication Communication
Scanner Type 1 (#1641) Scanner Type 2 (#1642)

LIB TYPE	Pos 1	Pos 2	Pos 1	Pos 2
1	-	-	#9501	#9502
1	#9311	#9312	#9511	#9512
8	#9381	#9382	#9581	#9582
10	#9401	#9402	#9701	#9702

The LIBs should be assigned to position in numerical order: that is, LIB Type A1s should be assigned to the lowest numbered positions, LIB Type 1s next lowest, etc., so that the highest type numbered LIB is in the highest numbered position. Each order submitted must indicate the Feature number for each LIB desired plus a location

- (Japan only > Specify code #2946 must be supplied to satisfy NTT's DTE self-test requirements when attaching a non-IBM modem with LSs 1A or 1D. Only one #2946 is required per 3704. <)

SPECIAL FEATURES

Non-Communications Features

Two-Channel Switch (#8002): (NO LONGER AVAILABLE) Provides for the attachment of a 3704 CA Type 1 (#1541) to two S/360, S/370, 30XX, 4331 or 4334 Processor channels (which may be on the same processor, or on two different processors). The CA so equipped will, however, be capable of operation on only one channel at a time. A manual switch on the CP selects the channel which is to be made operable. Maximum: One. Field Installation: Yes. Prerequisites: #1541.

Unit Protection (#8510): (NO LONGER AVAILABLE) Provides a lock on the 3704 which deactivates all switches (except power-off and power-on) when key is removed. Two keys are included. For additional or replacement keys, see "Accessories". Maximum: One. Field Installation: Yes.

Communications Features

Channel Adapter Type 1 (#1541): (NO LONGER AVAILABLE) Provides for communication with a S/360, S/370, 30XX, 4300 Processor Byte Multiplexer Channel. All such communications are accomplished via 1, 2, 3 or 4-byte transfers, with de-selection and re-selection between each transfer. Data transfer rates are primarily dependent on the 3704's internal processing requirements. Maximum: One. Field Installation: Yes.

Communication Scanner Type 1 (#1641): (NO LONGER AVAILABLE) Provides the interface between the communication line attachment features and the Central Controller. The CS Type 1 (#1641) uses the 3704 interrupt facilities to allow the program to perform character assembly and disassembly, and allows for program control of line control, control character recognition, code translation and error recovery functions. Limitations: This Scanner may not be installed if a CS Type 2 is to be installed. Maximum: One. Field Installation: Yes. Prerequisites: At least one #4650.

Communication Scanner Type 2 (#1642): (NO LONGER AVAILABLE) Provides the interface between the communication line attachment features and the Central Controller. The CS Type 2 (#1642) assembles and disassembles characters automatically, provides character buffering for each line and allows for program control of line control, control character recognition, code translation and error recovery functions. The basic scanner is operational with one LIB Type A1 only. Limitations: This scanner may not be installed if a CS Type 1 is to be installed. Maximum: One. Field Installation: Yes. Prerequisites: At least one #4650 and #3600. Specify: CS Expansion (#9090) to permit installation of two LIBs of any types except two LIB Type 1s (#4701).

LIB Position Designator: The position of the LIBs within the 3704 must be specified in accordance with the table below:

specify code (position number, from above table) based on the LIB Type.

The positions of the line sets within the LIB will be automatically assigned.

Cables: The cables that are included in each line set are listed in the "IBM Input/Output Equipment Installation Manual - Physical Planning", GC22-7064.

To obtain cables longer than 15 meters (50 feet), select the required cable below and order the cable assembly P/N and the required cable length in meters. These longer cables are ordered by P/N on (Except Canada>an MES.<) (Canada only>cable order Form 2642.<) The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the (Except Canada>QSLM file<) (Canada only>FED parts price list <) for prices.

To order a cable for a RS-232-C/CCITT V.24 Modem Interface Attachment:

Duplex (Line Set Type 1H #4714)
Order cable assembly P/N 1785928 (See Note 1)
Half Duplex (Line Set Type 1D #4714)
Order cable assembly P/N 1785929 (See Note 1)

To order a cable for a Autocall Originate (RS-366-A/CCITT V.25) Attachment:

(Line Set Type 1E #4715)
Order cable assembly P/N 1753439 (See Note 2)

Note 1: Maximum Length: 30 meters (100 feet).
Note 2: Maximum Length: 45 meters (150 feet).

Expansion Feature (#3600): (NO LONGER AVAILABLE) Required for mdls A2, A3, and A4 or CS Type 2 (#1642) on mdl A1. Maximum: One. Field Installation: Yes.

Business Machine Clock (#4650): (NO LONGER AVAILABLE) Provides clocking when the attached external CCITT modem or internal IBM line adapter does not provide this clocking. The speed of this clocking must be specified for each Business Machine Clock (#4650) ordered from the following table:

Speed (bps)	Specify
75	#9604 - for WT Teleprinters
100	#2716 - for WT Teleprinters

Limitations: Required only when modem does not provide clocking except that each CS requires at least one BMC, which must be at a speed less than one-half that of the lowest speed modem clocked line. Maximum: Four per CS Type 1 (#1641) or Type 2 (#1642). Field Installation: Yes. Prerequisites: #1641 or #1642. Note: Individual BMCs may be assigned by the program to one or more communication lines.

Line Interface Base Type A1 (#4700): (NO LONGER AVAILABLE) For attachment of up to four LSs 1A, 1C, 1F, 1E, or 1D in any combination.

Limitations: See CS Type 2 (#1642). When installed in combination with other type LIBs, the maximum of two applies to the total number of LIBs. Maximum: Two if CS Expansion (#9090) is specified with CS Type 2 (#1642). Without (#9090), maximum is one. Field Installation: Yes. Prerequisites: #1642.

Line Interface Base Type 1 (#4701): (NO LONGER AVAILABLE) Provides for the attachment of up to eight LS 1A, 1C, 1D, 1F. Limitations: When installed in combination with other type LIBs, the maximum of two applies. Maximum: Two with CS Type (#1641); one with CS Type 2 (#1642). Prerequisites: #1641 or #1642 with #9090. Field Installation: Yes.

Line Interface Base Type 8 (#4708): (NO LONGER AVAILABLE) Provides for the attachment of up to two Modem Attachment Bases - 1200 bps (#5103). Limitations: When installed in combination with other type LIBs, the maximum of two applies. Maximum: Two per 3704. Field Installation: Yes. Prerequisites: #1641 or #1642 with CS Expansion (#9090).

Line Set Type 1A (Low-Speed External Line Interface) (#4711): (NO LONGER AVAILABLE) Provides for the attachment of two start/stop communication lines at speeds up to 600 bps or at 1200 bps on nonswitched lines equivalent to two CCITT M 1020 lines in tandem. Limitations: When installed in combination with other type LSs, the maximum above applies to the total number of LSs. Maximum: Eight per LIB Type 1 (#4701), or four per LIB Type A1 (#4700). Field Installation: Yes. Prerequisites: #4701 or #4700 and a Business Machine Clock (or clocks) (#4650), assigned by the program to this LS.

Line Set Type 1C (Low-Speed Local Attachment) (#4713): (NO LONGER AVAILABLE) Provides for the local attachment of two half-duplex IBM Start/Stop terminals at speeds up to 1200 bps via IBM-provided cables. Modems are not required. Note: The attached terminal must provide a BMC and external modem cable to which the 3704 LS 1C cable will connect. Total cable length must not exceed 200 feet. Limitations: When installed in combination with other type LSs, the maximum above applies to the total number of LSs. Maximum: Eight per LIB Type 1 (#4701), or four per LIB Type A1 (#4700). Field Installation: Yes. Prerequisites: #4701 or #4700 and a Business Machine Clock (or clocks) (#4650) specified for the same speed as the terminal's clock.

Line Set Type 1D (Medium-Speed External Line Interface) (#4714): (NO LONGER AVAILABLE) Provides for the attachment of two start/stop communication lines at speeds up to 600 bps or at 1200 bps on nonswitched lines equivalent to two CCITT M 1020 lines in tandem, or synchronous communication lines at speeds up to 7200 bps, each of which has a CCITT V.24 interface for attachment to an external modem. Limitations: When installed in combination with other type LSs, the maximum above applies to the total number of LSs. Maximum: Eight per LIB Type 1 (#4700) or four per LIB Type A1 (#4701). Field Installation: Yes. Prerequisites: #4701 or #4700. Note: For speeds in excess of 4800 bps, see Address Substitution under "Specify". Prerequisites: #4701 or #4700.

Line Set Type 1F (Medium-Speed Local Attachment) (#4716): (NO LONGER AVAILABLE) Provides for the local attachment of two half-duplex, synchronous IBM terminals at speeds up to 2400 bps via IBM-provided cables. Modems are not required. This LS requires different cable groups depending upon terminal type. For cabling information, see "IBM System/370 Installation Manual - Physical Planning", GC22-7004; for Remote, see "Multiplexers", GA27-3006. Note: The attached terminal must be equipped with a BMC, and must provide a standard external modem cable to which the 3704 LS 1F external cable will connect. Total cable length must not exceed 100 feet. Limitations: When installed in combination with other LSs, the maximum below applies to the total number of LSs per LIB. Maximum: Eight per LIB Type 1 or four per LIB Type A1. Field Installation: Yes. Prerequisites: #4701 or #4700 and a Business Machine Clock (or clocks) (#4650) specified for the same speed as the terminal's BMC.

Line Set Type 8A (1200 bps Leased Integrated Modem) (#4781): (NO LONGER AVAILABLE) Provides for the attachment of one start/stop line up to 600 bps or one synchronous line at 1200 bps. This line set includes one 1200 bps Integrated Modem. No external modems are required. This integrated modem must communicate with another 1200 bps Integrated Modem. Limitations: Maximum: Two per Modem Attachment Base - 1200 bps (#5103). Field Installation: Yes. Prerequisites: #5103 and a Business Machine Clock (#4650) assigned by the program to this LS. Specify: (Japan only) Specify Code #2943 must be ordered when attaching to the NTT D-1 service.

Modem Attachment Base 1200 bps (#5103): (NO LONGER AVAILABLE) Provides for the attachment of up to two of LSs 8A (in any combination). Maximum: Two per LIB Type 8 (#4708). Field Installation: Yes. Prerequisites: #4708.

MODEL CONVERSIONS

May be made in the field.

ACCESSORIES (NO LONGER AVAILABLE)

Keys: A 3704 with Unit Protection (#8510) is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number

(stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (NONE)

3705 COMMUNICATIONS CONTROLLER

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

(3705-I Models A, B, C, D are no longer available).
ALL MODELS OF THE 3705-II ARE WITHDRAWN FROM MARKETING

Orders for Model Changes, Features, RPQs and Accessories will continue to be accepted until July 23, 1986.

The 2705 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Cntrlr	Max* Line	Max Stor	Host Program	Comm Cntrl Program
3705-II	255 352	512K 512K	BTAM VTAM/TCAM	EP ACF/NCP-PEP
3705-80	16 16	256K 256K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3704	32	64K	BTAM	EP
3725-1	256	1024 K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	24	512K	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach. CF3705 is required to determine actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

PURPOSE

The 3705-II attaches to all S/370, 30XX, 4331, 4341, or 9370 Processors or, in 2701/2702/2703 Emulation Mode only, to S/360 models 40, 50, 65, 67 (in 65 mode), 75 and 195 for communication with local or remote I/O devices over various PTT-provided or customer-owned communication facilities.

MODELS E-L

The 3705 consists of the following models based on either the number of frames and/or the storage capacity:

Model	Storage
E1, F1, G1, H1	32K
E2, F2, G2, H2	64K
E3, F3, G3, H3	96K
E4, F4, G4, H4	128K
E5, F5, G5, H5	160K
E6, F6, G6, H6	192K
E7, F7, G7, H7	224K
E8, F8, G8, H8	256K
J1, K1, L1	320K
J2, K2, L2	384K
J3, K3, L3	448K
J4, K4, L4	512K

3705-II models E01 through H08 consists of monolithic storage with a cycle time of 1.0 microseconds. 3705-II models J01 through L04 consists of monolithic storage with a cycle time of 900 nanoseconds.

The model numbering of the 3705 is 'x' 'y'. The 'x' is an alpha code designating the number of frames in a 3705; E represents one

frame, F or J two, G or K three, and H or L is four frames for 3705-II; 'y' is numeric code designating the storage size.

In the 3705-II (models E, F, G and H), the storage is housed only in the first frame, which has up to eight increments of monolithic storage. The 3705-II, models J, K and L have 256K of storage in the first frame and 64K in the second frame. Additional storage in 64K increments may be installed in the second frame for a maximum of 512K bytes.

Prerequisites: The APL Configurator (AID CF3705) must be used to prepare the DP Order.

Host Processor Attachments

The 3705-II requires a control unit position on a system channel, unless only the Remote Program Loader (RPL) feature is installed.

S/360 mdls 40, 50: Multiplexer Channel (standard). Attachment to S/360 is in 2701, 2702, 2703 emulation mode only.

S/360 mdls 65, 67 (65 mode), 75, 195: Multiplexer Channel of 2870. See M2870 pages. Attachment to S/360 is in 2701, 2702, 2703 emulation mode only.

S/370 mdls 115, 125: Multiplexer Channel (special feature). See M3115, M3125 pages.

S/370 mdl 135: Byte Multiplexer Channel (standard), Selector or Block Multiplexer Channel (special features). See M3135 pages.

S/370 mdl 135-3: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (special feature). See M3135-3 pages.

S/370 mdl 138: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (standard). See M3138 pages.

S/370 mdl 145: Byte Multiplexer or Selector Channel (standard), or Block Multiplexer Channel (special feature). See M3145 pages.

S/370 mdl 145-3: Byte Multiplexer Channel (standard), or Block Multiplexer Channels. See M3145-3 pages.

S/370 mdl 148: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (standard). See M3148 pages.

S/370 mdls 155, 155-II, 158 and 158-MP: (158 submodel 2 in Japan only) Byte Multiplexer or Block Multiplexer Channels (standard). See M3155, 3158 pages.

S/370 mdls 165, 165-II, 168, 168-MP, and 195: Selector Channel of 2860, Multiplexer Channel of 2870. Selector Subchannels (special features) of 2870, or Block Multiplexer Channel of 2880. See M2860, 2870, 2880 pages.

3031 Processor: Byte Multiplexer Channel (one is standard), Block Multiplexer Channels (five are standard). See M3031 pages.

3032 Processor: Byte Multiplexer Channel (one is standard), Block Multiplexer Channels (five are standard). See M3032 pages.

3033 Processor: Byte Multiplexer Channels (two are standard), Block Multiplexer Channels (ten are standard). See M3033 pages.

3081, 3083, 3084 Processor: Byte Multiplexer Channels, Block Multiplexer Channels. See M3081, 3083, 3084 pages.

3090 Processor: Byte Multiplexer Channels --- see M3090 pages.

4331 Processor: Byte Multiplexer Channel (special feature). See M4331 pages.

4341 Processor: Byte Multiplexer Channel (standard). See M4341 pages.

9370 Processor: Byte Multiplexer Channel (#6003). EP and PEP modes are not supported.

Note: The 3705-II attaches to a S/360 with a minimum of 128K bytes of storage.

Note: See "Programming" and "SCP" pages for attachment capability.

HIGHLIGHTS

A modular, programmable unit which expands the communications capabilities of S/360, S/370, 30XX, 4331 or 4341 Processors. By virtue of its modularity and programmability, the 3705 boasts a high degree of flexibility in tailoring to a teleprocessing system's requirements. Also, it can relieve the Processor of many TP functions, including, but not limited to, line control, polling, addressing, code translation and error recovery. The maximum number of communication lines which can be physically attached to a 3705 is 352 lines; but, the maximum number of communication lines capable of concurrent operation is a function of the speed of the lines, the type of Channel Adapter (CA), memory size, the Communication Scanner (CS) installed and the programming mode of operation. The maximum number of lines which can be physically installed can exceed the operational capability, see "Specify" for "special scheduled" systems. The 3705-II mdls E01 through H08 have a 1.0 microsecond storage cycle time, the 3705-II mdl J01 through L04 have a 900 nanosecond storage cycle time.

The 3705-II mdls J, K, and L require ACF/NCP/VS Release 2 and all following releases unless otherwise specified.

- **Communication Facilities:** The 3705 operates over PTT -provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.
- **3705 Local Attachment (Synchronous):** In addition to the synchronous terminals being attached to the 3705 through PTT -provided facilities, they may also be connected directly to the 3705 using LS Type 1D (LS1D) (#4714). In addition to the synchronous terminals being attached there must be corresponding Business Machine Clocks (BMC) in both the terminal and the 3705.
- **3705 Local Attachment (V.35):** Terminals may be attached locally to the 3705 using LS1W (#4727) (half-duplex) or LS1Z (#4728) (duplex) V.35 interfaces. No BMC is required in the attached device since clocking signals are provided by BMC(#4651) in combination with (#4727) or (#4728).

Customer Responsibilities: See M2700 pages. See also the 3704/3705 Programming pages for attachment capability and refer to Host Systems Programming pages for possible restrictions to the above attachments.

Machine Organization: The basic machine consists of the Central Control Unit (CCU) with storage (32K in the 3705-II) and an operator's control panel.

A minimum machine configuration must have, in addition to the base unit, the following features:

1. Either a Channel Adapter (CA) feature or the Remote Program Loader (RPL) feature. The CA requires different levels of processing overhead and thus yield different performance capabilities.
2. A Communication Scanner (CS) feature to provide for the connection between the Attachment Base (AB) feature and the Line Interface Base(s) (LIBs) features. Like the CAs, the various CSs have varying degrees of performance due to the different levels of processing overhead.
3. An AB which provides a common connection between the CSs and the CCU.
4. A LIB which provides the connection between the CS and the various LSs. The LIB provides the hardware for the mounting

of the individual LSs. Each LIB is designed for a certain set of functions in conjunction with the various LS.

5. A LS which provides the electronics and external cables to interface to a communication facility.

Note: Both the external cables and the LSs are individually ordered. The number of LSs that can be contained in a LIB is contingent upon the electronic hardware of the LS required to perform the functions supporting the communications facilities. See Figure 3.

6. A BMC which provides clocking of data in and out of CS.

Attachment Bases: The Attachment Base (AB) provides the physical and logical connection between the CA1 and the CCU, and between the CCU and the various CSs. There are two ABs. A 3705 must have at least one AB, and in some instances have two ABs.

Channel Adapter: The CA provides the logical interface between a 3705 and with defined host processor. Every 3705 must have at least one CA in the first frame (except those units having the RPL (#6260). CA1 can only be placed in the first frame of a 3705. When the second CA is a Type 2 or Type 3, then "ROS Substitution" must be specified on the first frame (3705), specify #9754. When there are two or more CA4s and the ACF/NCP/VS Program Product or EP/VS with PRPQ #P85032 is installed, then "N ROS Substitution" must be specified in every frame in which a CA4 is present, specify #9566.

When ordering or removing a CA, use the specify to indicate total number of CAs in the 3705 and 3706 combined and place this specify on the first 2 frames (3705 and first 3706).

if 1 CA, specify #9201

if 2 CAs, specify #9202

if 3 CAs, specify #9203

if 4 CAs, specify #9204

These "specifies" are required on the first two (2) frames whenever a CA is added to or removed from either frame.

External Cables: All CAs need external cables which must be ordered separately from the CA features. Limitations and Prerequisites: The 3705-I (first frame) can contain one CA Type 1, 2, 3, or 4. The 3706 (second frame) can contain one CA Type 2, 3, or 4.

3705-II (first frame) can contain two CSs. The 3706 (second frame) can contain two CSs.

When operating with ACF/NCP/VS the 3705-II (first frame), can contain two CAs. The 3706 (second frame) can contain two CAs. If two CSs are in one frame (3705-II), at least one of the adapters must be CA4. When operating with greater than one CA4 and EP/VS with PRPQ #P85032, two CA4s can be in the same frame. Note: EP 3.0 standalone only supports one CA4 in each frame.

No CSs are allowed in the third or fourth frame.

The CSs can be mixed with the following exceptions:

- When CA4 is in the same machine with either a CA2 or a CA3, then the CA4 would be in the first frame.
- The CA1 cannot be in a machine with either a CS3, CS3HS, or CA4. The CA1 is not available on a 3705 mdl J, K, or L.
- Emulation Mode requires either a CA1 or a CA4 connected to a byte multiplexer channel.
- CA2 and CA3 are used only with Network Control mode of the Network Control Program.
- For the 3705-II, if greater than two CAs are installed, the CAs must all be CA4s. Up to four CA4s are allowed.
- For the 3705-II, up to four I/O Channel Attachments are allowed (two per frame).
- For the 3705-II, Remote Program Load-II Feature (#6261) can coexist with a CA.

- For the 3705-II, if two CAs in the same frame, then no Two-Channel Switch (#8002) is allowed.
- Dual ROS need not be removed when total CAs are reduced to a single CA in the entire machine.

CA1 requires the AB1 as a prerequisite. CA2, CS3, and CS4 contain the AB function within their respective features.

Placement of various RPL/CA and CA configurations:

3705-II			
3705		3706	
LIB Pos 3.	LIB Pos. 2	LIB Pos. 3	LIB Pos. 2
RPL CA-4 (B1)	(A1)	(B1)	(A1)
LIB Pos. 4 CS-3 CS-3HS (B2)	LIB Pos. 1 (A2)	LIB Pos. 4 CS-3 CS-3HS (B2)	LIB Pos. 1 (A2)
CCU (B3)	CS-2 CS-3 CS-3HS (A3)	LIB Pos. 5 (B3)	CS-2 CS-3 CS-3HS (A3)
CCU (B4)	CA-1 CA-2 CA-3 CA-4 (A4)	CA-4 LIB Pos 6. (B4)	CA-2 CA-3 CA-4 (A4)

Note: CS-3 takes two positions.

Allowable Hardware Channel Adapter Combinations:

* Not available on a 3705-II J, K, L Models.

** Available only on 3705-II.

Definition of the different ROS types:

- "1" ROS type 1 is used to IPL over one channel either a CA1 or CA4. In addition, when 2 CA4s are installed, the IPL Source Switch must be used to select which channel is to do the IPL with a ROS type 1. No specify code is required for ROS type 1. See N ROS to allow for IPL over any CA4.
- "2" is used to IPL over only one channel, either a CA2 or CA3. No specify code is required for the Type 2 ROS.
- DUAL ("ROS Substitution") is used to IPL over one of two channels, using any appropriate combination shown above. Specify code #9754 is required for DUAL ROS.
- N ("N ROS SUBSTITUTION") to be used only with CA4s. ACF/NCP/VS, or EP/VS allows for IPL over any CA4. (PRPQ #85032 is needed to go beyond 2 CA4s in EP). Specify code #9566 is required for "N" ROS.
- RPL is used to IPL remotely. There is a separate ROS for the 3705-II remote. (Although remote is not mentioned on this page, it is listed here for convenience). No specify code is required for RPL ROS.

Allowable Hardware Channel Adapter Combinations with RPL/CA installed:

Communication Scanner Features: The CS features provide the common logical connection between the various LIBs with their respective LSs and the CCU. Each frame of a 3705 must have a CS if LSs are placed within the frame. There are three CSs, each with a different performance capability.

Limitations:

- One CS per frame. CS2 and CS3 can be placed within a 3705 in any combination.
- A CS1 (#1641) can only be placed in the first frame of a 3705-I (cannot be placed in a 3705-II).
- CS1 cannot be in a 3705 with a CS3 or CS3.
- Each CS1 or CS2 must have at least one BMC, but not more than four BMCs. CS3 must have at least one BMC (specify #9615), and may have one additional clock (specify #9609 or #9610).
- CS3 only supports attachment of LIBs 1, 8 and 10.
- CS3 cannot be in the first frame of a 3705-I.

7. A CS is required in a frame containing LIBs.
8. CS1 (#1641), cannot be installed with the NCP/VS Program Product.
9. CS3HS must have BMC, specify (#9615); no other clock is allowed.
10. CS3HS allows for the attachment of only LS1GA (#4722) or LS1TA (#4723).
11. Address Substitution is not allowed in a 3705 with a CS3HS (#1644). HSS is not allowed in conjunction with LS1GA and/or LS1TA.
12. The CS3 does not support Tributary support in EP 3.0.

Prerequisites: CS1 must have an AB1 in the 3705. CS2 and CS3, and CS3HS must have an AB2 in the 3705. A CS located in a particular frame requires a CS in each preceding frame. Field Installation: All scanners can be field installed.

Line Interface Base (LIB): LIBs are used to provide for the physical attachment of LSs in the 3705. LIB Type 1 must be placed in LIB position 1 if Address Substitution or HSS is to be required in the 3705. The LIBs with the highest speed lines should be placed in the lowest LIB positions (Position 1 is the lowest).

Maximum LIB Attachment Capability per Module - Figure 1

3705-I					
	1st	2nd	3rd	4th	Notes
	Modules				
CS 1	4	N/A	N/A	N/A	1
CS 2	4	6	6	6	1
CS 3	N/A	4	4	4	2

3705-II					
	1st	2nd	3rd	4th	Notes
	Modules				
CS 2	4	6	6	6	3
CS 3	3	4	4	4	2
CS 3HS	1	1	1	1	

Notes:

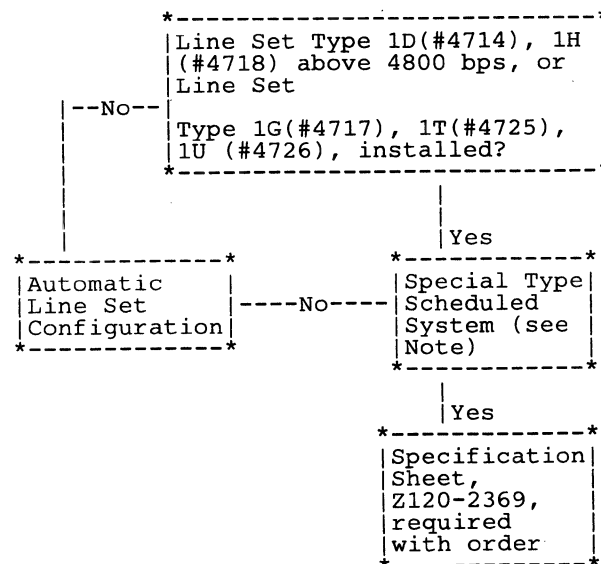

1. LIBs 1 through 12 can be attached to CSs Types 1 and 2 on the 3705-I.
2. LIBs 1, 8 and 10 will attach to the CS3 on the 3705-I or 3705-II (excluding LSs 1A, 1B and 1C).
3. LIBs 1 through 12 will attach to the CS2 on the 3705-II.
4. LIB capacity is limited by the number of CAs and/or the RPL feature. See RPL/CA Placement chart for available LIBs.
5. LSs operating over 10K bps must be in LIB position 1.

Limitations: When installed with other LIBs of the same or different type, the maximum cannot be exceeded. There are no restrictions on intermixing LIBs. Prerequisites: A CS is required in each frame containing LIB(s). Field Installation: All LIBs are field installable.

The LIBs must be assigned to a position in numerical order: that is, LIB Type 1s must be assigned to the lowest numbered positions, LIB Type 2s next lowest, etc., so that the highest type-numbered LIB is in the highest numbered position. The order as submitted then must specify a feature code and location specify code for each LIB to be installed.

The positions of the LSs within the LIB will, in most cases, be automatically assigned. To determine whether this automatic assignment is applicable, use the following flowchart: (Normally the Specification Sheet, Z120-2369, should be used only if required by the flowchart below. If, however, specific positions for LSs are de-

sired, even when the Automatic LS Configuration is suggested, fill out the Specification Sheet and submit it).

Note: A "Special Type Scheduled System" is one in which the 3705 is effectively servicing two different TP networks on a scheduled basis. That is, one set of communication lines is serviced in one time period and a second set of lines is serviced in a second time period and there is no overlap of the two systems in time.

Line Sets: LSs provide the electronic logic to meet the individual requirements of the communication facility. (See Figures 2 and 3 for attachment capability of LSs with respect to LIBs).

Note: All LSs require cables. See "Cables" for further details. The numeric portion of the LS type number indicates the LIB type. Each LS type shown is for only one LS.

Note: If the line speed is over 10K bps, the LS must reside in line address positions 0, 2, 4 or 6 when attached to CS2 or reside in line address positions 0, 2, 4, 6, 8, A, C, or E when attached to CS3. Over 10K bps, the LSs must reside in the first LIB, when attached to CS2 or CS3.

Note: See Scan Limits, Address Substitution, and HSS under "Specify".

LEGEND:

- A: Denotes an Autocall interface.
- X: Denotes a transmit/receive address for a half-duplex line if installed.
- .. Denotes an unused and unavailable address.
- . Denotes an unused and available address.
- TR: Denotes a Transmit Receive line pair; uses two adjacent addresses.
- T.R.: Denotes a Transmit Receive line pair; uses two adjacent even addresses.

Publications: GC20-0001

SPECIFY

- All 3705-1Is are to be ordered as follows:
 - "E" mdl's - order one 3705 mdl E1 through E8.
 - "F or J" mdl's - order one 3705 (any F or J mdl) and one 3706 (mdl code same as 3705) with #9755 to designate first 3706.
 - "G or K" mdl's - order one 3705 (any G or K mdl) and two 3706s (mdl code same as 3705). Each 3706 must be ordered separately. On one 3706 order, specify #9755 to designate the first 3706 and on the other one, specify #9756 to designate second 3706.
 - "H or L" mdl's - order one 3705 (any H or L mdl) and three 3706s (mdl code same as 3705). Each 3706 must be ordered separately. On one 3706 order, specify #9755 to designate first 3706, on another 3706, specify #9756 to designate second 3706 and on third 3706, specify #9757 to designate the third 3706.
- Note:** The 3706 type number is to be specified at no charge, and is to be used only for internal IBM ordering and control purposes. Order the 3705 and each 3706 separately with all its associated features. Specify items for voltage, color, and cabling must be ordered on the 3705 and each 3706. The 3706 type number should never appear on any agreement.

Note: When doing a model conversion, the Mdl I Frame Specify Code must translate to a Mdl II Frame Specify Code. The position must not be changed.

Position	Mdl I	Mdl II
2	#9751	#9755
3	#9752	#9756
4	#9753	#9757

For Power Compatibility: RPO S30251 (no charge) must be ordered with a 3706, if the 3705 to which it will attach is installed and has a serial number higher than 40000; otherwise, specify #9820.

When transferring a 3706 in the field from a 3705 with a serial number lower than 40000 to a 3705 with a serial number higher than 40000, RPO S30251 and removal of specify code #9820 must be ordered for the 3706.

When transferring a 3706 in the field from a 3705 with a serial number higher than 40000 to a 3705 with a serial number lower than 40000, specify code #9820 and removal of RPO S30251 must be ordered for the 3706.

Note: The above will result in appropriate installation and removal of B/M 1644026, which is required on 3706s with serial numbers lower than 50000 only when attached to a 3705 with a serial number higher than 40000.

3705 Feature Change: To relocate LSs and/or LIBs from one frame to another on a leased machine, concurrently submit a MES order for each frame, and specify #9544 on any order which contains relocations. Because specify code #9544 cause all LSs and LIBs on an order to be shipped as documents only, any outright adds should be ordered on a separate order than one containing specify code #9544. The LIB positions must be kept contiguous on each frame.

To relocate a LIB (and its associated LSs) within the same frame on a leased machine, indicate removal of that LIB position code, and indicate add of the desired LIB position code. Specify code #9544 is not required for relocations within the same frame.

If non-standard LS positioning is desired, specify #9545, submit a specification sheet (Form Z120-2369) and indicate same to the system when entering the order.

Note: An MES may be a mix of LSs and/or LIB moves, moves within the same frame, moves to and/or from other frames in the same machine. If a specification sheet is submitted, enter the installed LIBs and LSs in the "F/C" column, enter the Add F/Cs in the "Required" column, and enter the Remove F/Cs in the "Not Required" column.

- Power (AC, 3-phase, 4-wire):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	

Field Conversion: Yes (Except 200V, or frequency conversion.)

- Power Requirements: Specify #2747 for Machines to be installed in Japan.
- (Canada only) > If a 4.3 meter (14 feet) cable is not required, specify #9986 for 1.8m (6 ft) cable. <
- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, or #9046 for white. Not recommended for field installation.
- Address Substitution/Upper Limit Scan: For 3705s with a CS2, there are two methods of address modification: Upper Scan Limits and Address Substitution, which allow the CS2 to operate a line set at speeds greater than 4800 bps. For information

on USL, see the "IBM 3704 and 3705 Principles of Operation", GC30-3004.

Address Substitution (#1201, #1202, #1203, #1204): May be required when lines at speeds greater than 4800 bps are to be installed. Associated with the invocation by software, the Address Substitution capability allows multiple scanning of an LS's address at the expense of not scanning other LS addresses. The specify feature blocks the installation of a LS in those address positions that are not scanned by address substitution. The choice of which of the four following specify features is to be ordered should be based on the number of high-speed lines to be installed and their relative LS positions within the first LIB position. The lowest position (#1201) is always specified first, followed by each succeeding number. For those positions within a LIB where Address Substitution is invoked, only the even addresses are scanned. To allow installation of LSs in the "blocked positions", so that LSs can be used on a part time basis, do not specify the Address Substitution option.

Address Substitutions should not be specified when standard LS placement is desired on special scheduled systems which invoke address substitution SYGEN options only on a part-time basis.

- #1201 - Blocks installation of a LS in partition 8 (both 3705 and 3706s) on all Type 1 and Type 2 LIBs. Specify #1201 when the first LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.
- #1202 - Blocks installation of a LS in partition 7 (3705 and 3706s) on all Type 1 and Type 2 LIBs. Specify #1202 when the second LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.
- #1203 - Blocks installation of a LS in partition 6 (3705 and 3706s) on all Type 1, Type 2, Type 3 and Type 10 LIBs. Specify #1203 when the third LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.
- #1204 - Blocks installation of a LS in partition 5 (3705 and 3706s) on all Type 1, Type 2, Type 3 and Type 10 LIBs. Specify #1204 when the fourth LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.

Maximum: One each of the above per 3705 and 3706. **Limitations:** The same specify feature should be ordered on all associated 3706(s) when a 3705 requires Address Substitution. **Prerequisites:** #1642. **Field Installation:** Yes.

Note: When Address Substitution is specified, it will block LS installation in all LIBs in the 3705 and associated 3706(s), and therefore, will reduce the physical line handling capability of the 3705. See "IBM 3704/3705 Communications Controller, Principles of Operation", GC30-3004, for further details.

Address Substitution should not be used on a 3705 containing a CS1 or CS3.

Note: When CS3 High-Speed (#1644) is in a 3705, the Address Substitution cannot be used by any scanner in the 3705. High-Speed Select cannot be employed with LS 1TA or 1GA.

High-Speed Select: For the 3705 with a CS3 there are two methods of address modification: Upper Scan Limits (USL) and High-Speed Select (HSS), which allow the CS3 to operate with LS speeds greater than 4800 bps. For information on USL, see the "IBM 3704 and 3705 Principles of Operation", GC30-3004.

HSS (#1211, #1212, #1213, #1214, #1215, #1216, #1217, #1218) may be required when lines at speeds greater than 4800 bps are to be installed. The specify feature blocks the installation of a LS in a position whose address is not scanned. The choice of which of the eight following specify features is to be ordered should be based on the number of high-speed lines used and their relative positions within a LIB position. For those positions within a LIB where High-Speed Select is invoked, only the even addresses are scanned.

- #1211-Blocks installation of a LS in partition 1 of the additional LIBs within a 3705 or 3706 module. Only the 3705 or 3706 module containing the high-speed line is affected.
- #1212-Blocks installation of a LS in partition 2
- #1213-Blocks installation of a LS in partition 3
- #1214-Blocks installation of a LS in partition 4
- #1215-Blocks installation of a LS in partition 5
- #1216-Blocks installation of a LS in partition 6
- #1217-Blocks installation of a LS in partition 7
- #1218-Blocks installation of a LS in partition 8

Note: When HSS is specified, it will restrict LS installation in all LIBs (except LIB position 1) of the 3705 or 3706 which has the scanner modification implemented. See "IBM 3704/3705 Principles of Operation", GC30-3004, for further details. **Prerequisites:** CS3 (#1643). **Maximum:** One each of the above per CS3 (#1643). **Limitation:** None. **Field Installation:** Yes.

Note: When CS3 High-Speed (#1644) is in a 3705, the Address Substitution cannot be used by any scanner in the 3705. HSS cannot be employed with LS 1TA or 1GA.

- **Cabling:** #9080 for below floor, or #9081 for on floor.
- A Communication Cable Order must be submitted for: Each new 3705 or 3706 machine order; each MES order where the added feature requires external cable.
- In Japan, #2946 must be supplied to satisfy the NTT's DTE self-test requirements when attaching a non-IBM modem with LSs 1A, 1D or 1H. Only one 2946 is required per 3705. When ordering an IBM Integrated Modem (LSs 5A, 5B, 8A, 10A, 11A, 11B, or 12A), one #2943 must be ordered for each modem.
- Prior to submitting an MES order, the Branch Manager should be consulted for any software/hardware compatibility requirements resulting from the order.
- 3705 Specification Sheet: A completed sheet (Z120-2369) may be required. See "Line Attachment Configurator" in the Special Features section.
- If a 3705 is ordered with one (or none) of the following specify codes, the same must be ordered for all 3706 expansion frames (if any) in the machine.
- The 3705 operator panel language will be determined by one of the following specify codes. If one of the following is not specified, France will receive French, Germany will receive German, and all other countries will receive English.
- The 3705 or 3706 service area warning labels will be supplied in the official language of the following countries regardless of specify code ordered. For other countries, the label language will be determined by one of the following specify codes unless one of the following is not specified, in which case the labels will be supplied in English.

The following specify codes are not field installable:

Country	Code	Label	Panel	Specify
Canada	649	English/ Can. Fr.	English	#2934
France	706	French	French	#2928
Germany	724	German	German	#2929
Italy	758	Italian	English	#2932
Japan	760	Japanese	English	#2930
Spain	838	Spanish	English	#2931
UK	866	English	English	#2927

- **Cables:** The cables that are included in each line set are listed in the "IBM Input/Output Equipment Installation Manual - Physical Planning", GC22-7064. These cables must be ordered separately from the 3705 order on a cable order.

To obtain cables longer than 15 meters (50 feet), select the required cable below and order the cable assembly P/N and the required cable length in meters. These(Except Canada > longer cables are ordered by P/N on an MES.<) (Canada

only> Longer cables are ordered by P/N on cable order Form 2642. <) The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the(Except Canada> QSLM file<) (Canada only> FED parts price list<) for prices.

To order a cable for a CCITT V.35 Interface Modem Attachment:

Duplex (Line Set Type 1U #4726)
Order cable assembly P/N 1648394
(See Note 1)

Half-Duplex (Line Set 1K #2944)
Order cable assembly P/N 5997479 (See Note 1)

To order a cable for a Autocall Originate (RS-366-A/CCITT V.25) Interface Attachment:

(Line Set Type 1E #4715)
Order cable assembly P/N 1753439 (See Note 2)

Note 1: Maximum Length: 30 meters (100 feet)

Note 2: Maximum Length: 45 meters (150 feet)

To order a cable for a EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The 3705 can now support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 15 meters (50 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications.

To connect a cable longer than 15 meters (50 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.

2. If the suffix is "DG" or earlier:

A 3863 or 3864 or 3865 modem which does not have Data Multiplexer #3260 installed must have EC 344120 installed.

A 3865 modem with Data Multiplexer #3260 installed must have EC 323406 installed.

3. Order a Duplex or Half-Duplex Cable:

Duplex (Line Set 1D or 1H #4714 or #4718, order cable assembly P/N 1785928. (See Note 1.)

Half-Duplex (Line Set 1D #4714, order cable assembly P/N 1785929. (See Note 1.)

Note: Maximum length 100 meters (328 feet).

SPECIAL FEATURES

Non-Communications Features

Remote Power - Off (#6250): Provides the capability of turning the 3705-II power off with a command over a communication line. This feature is applicable to the 3705-II when the 3705-II is utilized only as a remote stand-alone. Maximum: One per 3705-II. Field Installation: Yes. Prerequisites: #6261.

Remote Program Loader-II (#6261): Provides the means of remotely loading the NCP with or without a CA on the machine. Maximum: One per 3705-II. Limitations: For the 3705-II, cannot be installed with four CA4s (#1544), but any other proper CA combination (see CA section) is acceptable; also, the RPL-II feature on the 3705-II cannot be installed with #4705 or #5001 unless there is a CA also installed. Field Installation: Yes.

Two-Channel Switch (#8002): To attach either #1541, #1542 or #1544 to two defined host Processor channels, which may be on the same CPU or on two different CPUs. The CA so equipped will, however, be enabled for operation on one channel at a time. Selection of which channel is to be operable is by a manual switch on the control panel. Maximum: One per CA. Limitations: If two CAs are in the same frame, then no #8002 is allowed; otherwise, one #8002 per CA. Field Installation: Yes. Prerequisites: #1541 or #1542 or #1544.

Unit Protection (#8510): Provides a lock on the 3705 that deactivates all push buttons, mode select switches, and diagnostic rotary switches on the control panel when the key is removed from the lock, channel enable/disable, function select rotary switches and power on/off are unaffected. This is included on all models. For additional or replacement keys, see "Accessories". Maximum: One per 3705. Limitations: None. Field Installation: Yes. Prerequisites: None.

Communications Features

Attachment Base Type 1 (#1301): Provides interface logic for CA1 and/or the CS1. Limitations: #1301 is needed on the 3705-II only when used in conjunction with #1541. No more than one #1301 or #1302 per 3705. Field Installation: Yes.

Attachment Base Type 2 (#1302): Provides interface logic for CS2, CS3, and CS3HS. Limitations: #1302 is required for CS2, CS3 or CS3HS. No more than one #1301 or #1302 per 3705. Field Installation: Yes. Note: CA2, CA3, and CA4 contain the AB logic within the logic of their respective features.

Channel Adapter Type 1 (#1541): For communication with the defined host processor Byte Multiplexer Channel. All such communications are accomplished via 1, 2, 3 or 4-byte transfers, with de-selection and re-selection between each transfer. Data transfer rates are primarily dependent upon the 3705's internal processing requirements. Maximum, Limitations, Prerequisites: See above general description. Field Installation: Yes.

Channel Adapter Type 2 (#1542): A high-performance adapter for NCP mode only, which supports communication with a defined host processor's Byte Multiplexer, Block Multiplexer, or Selector Channel, at data transfer rates of up to 276 KB bytes/second (limited by system channel capability). Transfer is always accomplished in "burst" mode, with a 2-byte "burst" standard on the Byte Multiplexer Channel, full "burst" standard on the Block Multiplexer and Selector Channels. Maximum, Limitations, Prerequisites: See general description under "Highlights". Field Installation: Yes.

Channel Adapter Type 3 (#1543): An adapter of the same performance characteristics as the Type 2 (#1542) with the additional capability of an automatic two-processor switch. It communicates with a defined host processor's Byte Multiplexer, Block Multiplexer, or Selector Channel (mdls 115 and 125 excepted). The switch, part of the basic adapter, is primarily designed to furnish symmetric support for two tightly-coupled processors; i.e., each side of the switch is connected to one of the two MP CPUs. Additionally, this Adapter can be attached to two channels from one CPU to provide alternate path capability. For either tightly-coupled multiprocessor or single CPU attachments, data transfer occurs on only one path at a time. Included as standard is a remote switch attachment capability to remotely control the switch from the configuration control panel of a S/370 Mdl 158 MP or 168 MP, as well as from the 2925 mdl 10 Remote Switching Console. Maximum, Limitations, Prerequisites: See general description under "Highlights". Field Installation: Yes.

Channel Adapter Type 4 (#1544): Provides attachment to defined host processor's Byte Multiplexer, Block Multiplexer or Selector Channel. It supports either a high-performance Emulation Program running with a CS3HS, a CS2 or CS3 or a high-performance Network Control Program running the same scanners. When attached to a byte multiplexer channel, the CA4 transfers bytes in "bursts" of up to 32 bytes prior to interrupting the control program when running in EP mode. In ACF/NCP/VS mode, the CA4 transfers in "bursts" up to 16 bytes and can transfer up to 248 bytes prior to interrupting the control program. In ACF/NCP/VS mode, when attached to a defined host processor's Block Multiplexer or Selector Channel, the CA4 "bursts" up to 248 bytes and can transfer up to 248 bytes prior to in-

interrupting the control program. When the CA4 is supported using the ACF/NCP/VS Program Product, the CA operates in a cycle steal mode (data is directly moved to or from storage, and after this is accomplished, the control program resumes its operation at the completion of this stolen cycle unless another "cycle steal" request is pending). The cycle steal operation improves the 3705 throughput when compared with NCP/VS support of CA4 by reducing the number and complexity of control program interrupts. When attached to a byte multiplexer channel and supported by NCP/VS, the CA4 transfers in bursts of 4 bytes per control program interrupt. This CA is necessary when using the CS3 in Emulation Mode. Maximum, Limitations, Prerequisites: See general description under "Highlights". Field Installation: Yes.

Communication Scanner Type 2 (#1642): Provides a medium performance operation. The Scanner provides for the transfer of data between storage and the LSs on a byte-by-byte basis. The Scanner assembles and disassembles characters. The Scanner interrupts the control program on a byte-by-byte basis. The control program provides for the line control, control character recognition, code translation and error recovery functions. Maximum: One Scanner per frame. Limitations, Prerequisites: See "Highlights". Field Installation: Yes.

Communication Scanner Type 3 (#1643): Provides a high performance operation. This Scanner provides for data transfer between storage and the LSs on a multi-byte (buffer) basis. Data transfer between storage and the CS3 is accomplished on a storage cycle steal basis (the CS3 interrupts execution of the control program for a machine cycle, moves data to or from storage. At the conclusion of the data movement, the control program resumes its operation at the point of the interrupt, unless another "cycle steal" request is pending.) This feature supports only synchronous lines and provides control character recognition for BSC and SDLC line controls. This feature provides ASCII to EBCDIC and EBCDIC to ASCII code translation when operating with BSC line control, in NCP mode only. The CS3 interrupts the control program either on (up to 254 character) buffer boundaries, or by unique control characters, or at certain error conditions. Maximum: One Scanner per Frame. Limitations: If a CS3 on a 3705 mdl L is in the last frame, order RPQ S30274 (no-charge) for all the frames. Prerequisites: See "Highlights". Field Installation: Yes.

Communication Scanner Type 3 High-Speed (#1644): Is a modified #1643 which allows line speeds up to 230.4K bps. Only two half-duplex data or one full-duplex data line can be attached to this scanner. Maximum: One Scanner per frame. Limitations and Prerequisites: See general description under "Highlights". Field Installation: Yes.

Line Set Type 1K (#2944): (External CCITT V.35 Modem) Provides for the attachment of one synchronous communication line for operation at 48K bps, 40.8K bps, 56K bps, or 57.6K bps, via an external modem having an interface that conforms to the requirements of CCITT V.35. The 1K LS may be operated at 14.4K bps or 57.6K bps in conjunction with a #4727 in another 3705. See Scan Limits, Address Substitution and HSS under "Specify". Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Business Machine Clock #4651: When either #4727 or #4728 is located in a #4701, then a BMC #4651 must be added to the LIB. Maximum: One per 3705/ or 3706 module. Limitations: Must be applied to LIB 1 in position one of a 3705 or 3706 module. Prerequisites: #4727 or #4728 in LIB position one. Specify: #9621 for 14.4K bps --- #9622 for 57.6K bps.

Line Interface Base Type 1 (#4701): Provides for attaching LSs which interface to external modems or locally (directly) attached terminals. Maximum, Limitations, Prerequisites: See Figure 1. Field Installation: Yes.

Line Interface Base Type 2 (#4702): Provides for attaching LSs which interface to telegraph circuits. Maximum, Limitations, Prerequisites: See Figure 1. Field Installation: Yes.

Line Interface Base Type 3 (#4703): Provides for attaching IBM Limited Distance Line Adapters. Maximum, Limitations, Prerequisites: See Figure 1. Field Installation: Yes.

Line Interface Base Type 8 #4708: Provides for attaching 1200 bps Integrated Modems. Maximum, Limitations, Prerequisites: See Figure 1. Field Installation: Yes.

Line Set 1D (#4714): (up to 9600 bps Attachment) Provides for the attachment of external modems or Direct Attachment of terminals. One of the following cable groups must also be ordered.

1. **Modem Attach Half-Duplex, cable group #485:** Two communication lines (up to 19.2K bps over nonswitched or switched facilities and 9.6K bps over switched facilities in synchronous mode). This cable group is mandatory for 2-wire SNBU with a 5865 or 5866 equipped with #7952.
2. **Modem Attach Duplex, cable group #473 for Synchronous Attachment, or cable group #492 for Asynchronous Attachment:** One communication line up to 19200 bps over nonswitched, 4-wire, facilities, transmitting duplex data, using external modems with EIA RS-232-C/CCITT V.24 interfaces. This mode of operation provides for the transmission of data simultaneously in a transmit and receive mode. This function is to be used in place of #4718 or #4712.
3. **Direct Attach Synchronous, cable group #1358, up to 100 feet:** For direct attachment of two half-duplex IBM Terminals up to 2400 bps with IBM-provided cables. Modems are not required. This LS requires different cable groups depending upon terminal type. For cabling information see "IBM System/370 Installation Manual - Physical Planning", GC22-7064. The attached terminals must be equipped with a BMC and must provide a standard external cable to which this cable will attach. This function is to be used in place of #4716.

Note 1: When operating this LS over 4800 bps, refer to Address Substitution and HSS under "Specify".

Note 2: For Asynchronous Direct Attach Operation, order RPQ 8Q0261.

Line Set Type 1E (#4715): (Autocall Unit) Provides two RS-366 interfaces for attachment of external automatic calling units. Maximum, Limitations and Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 1G (#4717): (High-Speed External Modem) For attachment of one synchronous communication line for operation at 19.2K bps, or 50K bps. Has a digital interface for attachment to a switched or leased wideband external modem. Note: Total wire length may not exceed 4.75 wire-miles. See GA24-3435 for further details. See Scan Limits, Address Substitution and High-Speed Select under "Specify". Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 2A (#4721): (Telegraph Single Current) For attachment of two single current telegraph lines, each of which may be wired for 20 mA, 40 mA, or 62.5 mA single current termination. Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 1GA (#4722): (High-Speed External Modem) For attachment of one synchronous, half-duplex data communication line for operation up to 230.4K bps; has a digital interface for attachment to a leased wideband external modem. Maximum: Two per #4701. Limitations: Up to two LSs of this type allowed in the same 3705/3706 frame. Field Installation: Yes. Prerequisites: #1644.

Line Set Type 1TA (#4723): (High-Speed External Modem) For attachment of one synchronous, full duplex data communication line for operation up to 230.4K bps. Has a digital interface for attachment to a leased wideband external modem. Maximum: One per #4701. Limitations: Only one LS per 3705 or 3706 frame. Field Installation: Yes. Prerequisites: #1644.

Line Set Type 1T (#4725): (High-Speed Duplex External Modem) 20.4K bps, and 40.8K bps. This LS will only run with the NCP program product. Provides for the attachment of one duplex synchronous line which has a digital interface for attachment to an external data set for 20.4K bps, and 40.8K bps

leased wideband facilities. The control program must condition this line interface for external clock control. See Scan Limits, Address Substitution and HSS under "Specify". Maximum, Prerequisites, and Limitations: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 1U (#4726): (High-Speed Duplex External Modem) 48K bps. This LS will only run with the NCP program product. Provides for the attachment of one duplex synchronous line which has a CCITT V.35 interface for attachment to an external data set for up to 48K bps communication facilities. The control program must condition this line interface for external clock control. The 1U LS may be operated at 14.4K bps or 57.6K bps in conjunction with a #4728 in another 3705. See Scan Limits, Address Substitution and HSS under "Specify". Maximum, Prerequisites and Limitations: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 1W (#4727): (High-Speed Local Attach) 14.4K bps or 57.6K bps, half-duplex data. Provides for local attachment of a single half-duplex synchronous device which has a CCITT V.35 type interface (similar to the LS Type 1K.) Clocking is provided for this LS by #4651; the attached device must be set for external clock control. The total cable length must not exceed 60 meters (200 feet) at 14.4K bps operation, and 30 meters (100 feet) at 57.6K bps operation. The total length includes the attached device cable length. See Scan Limits, Address Substitution, and HSS under "Specify". Maximum: Eight per LIB Type 1. Limitations and Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 1Z (#4728): (High-Speed Local Attach Duplex) 57.6K bps duplex data. Provides for the local attachment of a single duplex synchronous device which has a CCITT V.35 interface (similar to LS1U). Clocking is provided for this LS by #4651, such that the attached device must be set for external clock control. The total cable length must not exceed 60 meters (200 feet) at 14.4K bps operation, and 30 meters (100 feet) at 57.6K bps operation. The total length includes the attached device cable length. See Scan Limits, Address Substitution, and HSS under "Specify". Maximum: Four per LIB Type 1. Limitations and Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 3A (#4731): (Limited Distance Type 1 Line Adapter, 2-wire) For attachment of two half-duplex, start/stop lines at speeds up to 134.5 bps. Includes two IBM Limited Distance Type 1 (2-wire) Line Adapters and no external modems are required. Note: Total wire length may not exceed 4.75 wire-miles. See GA24-3435 for further details. Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 3B (#4732): (Limited Distance Type 1 Line Adapter, 4-wire) For attachment of two start/stop lines at speeds up to 134.5 bps. Includes two IBM Limited Distance Type 1 (4-wire) Line Adapters; no external modems are required. Note: Total wire length may not exceed 4.75 wire-miles. See GA24-3435 for further details. Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 8A (#4781): (1200 bps Leased Line Adapter) Provides for the attachment of two start/stop or synchronous lines at speeds up to 600 bps or at 1200 bps. This LS includes two 1200 bps LAs suitable for communication over a leased voice grade channel with similar LAs. No external Modems are required. Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Set Type 10A (#4784): (1200 bps Leased Duplex Data Integrated Modem) Provides for the attachment of one synchronous line capable of duplex data transmission at speeds up to 1200 bps. This LS includes one 1200 bps integrated modem. No external modem is required. Maximum, Limitations, Prerequisites: See Figures 1 and 3. Field Installation: Yes.

Line Interface Base Type 10 (#5000): Provides for attaching 1200 bps Integrated Modems with duplex data transmission capability. Maximum, Limitations, Prerequisites: See Figure 1. Field Installation: Yes.

Line Set Type 1N (#5655): (Nonswitched CCITT X.21 Interface) Provides for the attachment of two half-duplex data nonswitched synchronous lines, or one duplex data nonswitched synchronous

line at speeds of 2400 or 4800 or 9600 or 48K bps, via a DCE complying with CCITT Recommendation X.21. Operation is allowed with either a #1642 or a #1643. Specify #9842 for medium speed applications (2400 or 4800 or 9600 bps). Specify #9843 for high-speed applications (48K bps). Order cable group #1391 for duplex, or order cable group #1392 for half-duplex (one for each LS) and order cable group #1396 (required only one per 3705 or 3706) (Maintenance "Y" Cable). Limitations and Maximum: See Figures 1 and 3. Field Installation: Yes. Prerequisites: #4701 --- #4650 at 2400 bps (specify #9610). (This is in addition to the BMC required for all externally clocked LSs.)

Line Set Type 1R (#5656): (Switched CCITT X.21 Interface) Provides for the attachment of one duplex data switched synchronous line at speeds of 2400, or 4800, or 9600 or 48K bps, via a DCE complying with CCITT Recommendation X.21. Operation is allowed only on a CS2 (#1642). Specify #9840 for medium-speed application (2400, 4800, or 9600 bps). Specify #9841 for high-speed application (48K bps). Order cable group #1391 for each LS. Limitations: May be installed only on a 3705-II and CS2. See Figures 1 and 3. Maximum: See Figures 1 and 3. Field Installation: Yes. Prerequisites: #4701 --- BMC at 2400 bps; (#4650, specify #9610) --- BMC (#4650) at 1/24 or less of the operating speed of the attached Data Communication Equipment; for 2400 bps specify #2716, or #9604, or #2715; for 4800 bps, specify #2717, or #9606, or #2716, or #9604, or #2715; for 9600 bps, specify #9612, or #2717, or #9606, or #2716, or #9604, or #2715; for 48K bps, specify #9609, or #9608, or #9607, or #9612, or #2717, or #9606, or #2716, or #9604, or #2715.

Business Machine Clock (#4650): Within each communication channel there must be a clocking mechanism to time the data rate. When this clocking mechanism is not provided by either the communication facility or the modem, then the 3705 must provide the clocking through the use of a BMC. The clock speed should match the data rate in bits per second (bps). The BMCs are contained within the CS. A clock in a CS cannot be used by communication lines attached to a different CS. Each CS1 or CS2 must have at least one BMC, with each scanner limited to a maximum of four clocks. If a CS has at least one communication line attached where either the modem or the communication facility provides the clocking, then one of the possible four clocks in the scanner must be less than one-half the speed of the lowest speed of the externally clocked line attachment. The 1N and 1R LSs each have unique internal clock requirements. See detail descriptions of these LSs for further information. All local attached terminals must have a BMC in the 3705 which matches the transmission rate (bps) of the terminal. Note: The BMC is assigned to a given communication line interface under the control of the program operating in the 3705. Note: CS3 must have BMC --- Specify #9615 and may have one other clock (either specify #9609 or #9610). The following LSs must have a BMC:

Line Set 1A #4711
Line Set 1B #4712
Line Set 1C #4713
Line Set 1D #4714 when used for direct attach, or start/stop.
Line Set 1F #4716
Line Set 1N #5655
Line Set 1R #5656
Line Set 2A #4721
Line Set 3A #4731
Line Set 3B #4732
Line Set 4A #4741
Line Set 4B #4742
Line Set 4C #4743
Line Set 8A #4781
Line Set 10A #4784

The following LSs may require a BMC, if the clocking is not supplied by the modem:

Line Set 1D #4714
Line Set 1H #4718

A BMC is required for each speed; specify one of the following speeds for each BMC:

Speed	Specify
50.0	#2715 - for WT Teleprinters
75.0	#9604 - for WT Teleprinters

MACHINES

100.0 #2716 - for WT Teleprinters
134.5 #9606
200.0 #2717
300.0 #9612
600.0 #9607
1200.0 #9608
2000.0 #9609
2400.0 #9610
150,600,1200 #9615*

* Note: #9615 is only available with #1643 and #1644, and is mandatory.

Maximum: Four with CS type 1 or Type 2. Two with CS3. Field Installation: Yes. The above requirements for a BMC can only be satisfied by #4650. These requirements are not satisfied by #4651.

MODEL CONVERSIONS

For an installed or on-order 3705, any required 3706(s) must be ordered on AAS. Any model change on an installed 3705, whether or not an additional 3706 is needed, must have an MES(s) entered for the model conversion on both the 3705 and any installed 3706(s). "Specify" items for voltage, color, and cabling must be included on new 3706 order(s). Also see Specify items for Address Substitution and for Communication Cable Order.

- The change from Models A, B, C, or D to models J, K, or L must be done in two stages. Order the first MES to go from A, B, C, or D to E, F, G, or H and the second MES to go from models E, F, G, or H to Models J, K, or L.
- The model designations for the 3705 and all associated frames (3706s) must be changed whenever memory is added or deleted, and whenever a frame (3706) is added or deleted.

3705 models J, K, or L are not recommended for field downgrade to 3705 models A, B, C, D, E, F, G, H and 3705 models E, F, G, or H are not recommended for field downgrade to 3705 models A, B, C or D.

ACCESSORIES

Keys: A 3705-II with Unit Protection (#8510) is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (NONE)

3705 COMMUNICATIONS CONTROLLER MODEL 80

PURPOSE

The 3705-80 will attach to S/370, 303X, 4300, or 9370 Processors for communication with local or remote I/O devices over various communication facilities. The 3705-80 will also attach to S/360 models 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only.

The 3705-80 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Cntrl	Max* Line	Max Stor	Host Program	Comm Cntrl Program
3705-80	16 16	256K 256K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3704	32	64K	BTAM	EP
3705-II	255 352	512K 512K	BTAM VTAM/TCAM	EP ACF/NCP-PEP
3725-1	256	1024K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	24	512K	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach, CF3705 is required to predict actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

MODEL 80

The 3705-80 is available in sub-models to allow easy selection of a communications controller by line attachment capability. These models are:

M81: (NO LONGER AVAILABLE) 4 Line Attachments of EIA RS-232-C/CCITT V.24

M82: (NO LONGER AVAILABLE) 10 Line Attachments of EIA RS-232-C/CCITT V.24

M83: (NO LONGER AVAILABLE) 16 Line Attachments of EIA RS-232-C/CCITT V.24

M84: 10 Line Attachments of:

- 4 EIA RS-232-C/CCITT V.24
- 6 CCITT X.21

HIGHLIGHTS

The 3705 Communications Controller mdl 80 is designed for a user starting in communications. The 3705-80:

- Contains all the required features and functions to run duplex or half-duplex data transmission communication lines to an EIA or CCITT interface in the multiplexer; a channel adapter or RPL must be selected. Cables must be ordered separately.
- 256K bytes of storage are standard on all models.
- Uses ACF/NCP/VS R2.1, ACF/NCP/VS R3, NCP/VS for OS/VS with one channel adapter, or EP 3.0.

- Has a common line set for SDLC, BSC and Start/Stop protocols at line speeds up to 9600 bps for Start/Stop and 19.2K bps for SDLC and BSC.
- Provides a basic Business Machine Clock (BMC) of 134.5 bps in all models.
- The operator's Panel Key Lock is standard on all models.
- Publications: See related publications in the "Introduction to the IBM 3705-80 Communications Controller", GA27-3304, available from Mechanicsburg.
- Provides for attachment of a duplex or half-duplex line (CCITT V.35) up to 56K bps, or
- Provides a digital interface for attachment of a duplex or half-duplex line up to 50K bps, or
- Allows for attachment of up to two switched or nonswitched CCITT X.21 lines up to 9600 bps, or
- Allows for attachment of a CCITT X.21 high-speed line up to 48K bps Auto Call Units, or
- Allows for high-speed local attachment of devices at 14.4K bps, or 57.6K bps.
- Allows for the attachment of Channel Adapter 1 (byte mode of operation).
- Allows for the attachment of one or two Channel Adapters Type 4 (cycle steal mode or byte mode of operation).
- Allows for the connection of any one of two host channels with the two-channel switch (manual operation).
- Allows for remote operation with the Remote Program Loader with or without a channel adapter.

Machine Organization: The 3705-80 provides all functions necessary to run duplex or half-duplex EIA or CCITT lines up to 9600 bps with EP, NCP or PEP; a channel adapter or RPL must be selected. Cables must be ordered separately. Major components of the 3705-80 are:

- Communications Scanner Type 2 (CS2) modified is standard in all models and provides for connection between the line and the Central Control Unit (CCU). The modified CS2 scans the line addresses and places the information into the CCU storage.
- 256K bytes of storage are standard in all models.
- Channel Adapter 1 (CA1) provides the interface between the 3705-80 and a S/370, 30XX or 4300 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA1 communicates with the processor byte multiplexer channel. The CA1 is an optional feature. Only one can be installed per machine.
- Channel Adapter 4 (CA4) provides the interface between the 3705-80 and a S/370, 30XX, 4300, or 9370 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA4 can connect to the byte multiplexer channel (like the CA1), the block, or selector channels.
- Line sets and line attachments provide the electronics to interface to a communications facility.
- BMC provides the clocking of data in and out of the communications scanner. A BMC of 134.5 bps is included in all models. A total of four clocks can be included.
- Remote Program Loader (RPL) feature provides the means of loading the NCP into the 3705-80 without using the channel adapter. This is an optional feature.

- The Operator Panel Lock (Unit Protection) provides a keylock that deactivates all push buttons, mode select switches and diagnostic rotary switches on the control panel when the key is removed from the lock. Channel enable/disable, function select rotary switches and power on/off are unaffected. This is included on all models. For additional or replacement keys, see "Accessories".
- High-speed line attachment (19.2K bps to 57.6K bps using the CCITT V.35 or digital interface). One high-speed duplex line, or two half-duplex high-speed lines can be attached to the 3705-80. Address Substitution is used in the 3705 program for the Communications Scanner Type 2 (modified) to scan the high-speed even line addresses at a greater frequency.
- Upper Scan Limit of 16 must be used when the EIA RS-232-C/CCITT V.24 is operated at 19.2K bps to scan even and odd line addresses.

Communications Facilities: The 3705-80 operates over PTT-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Modems: The following modems are used with the 3705-80. These modems take advantage of the diagnostic capabilities which are contained in the Network Problem Determination Application (NPDA) Release 2 (PP 5735-XX8). The modems are:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1/2	2400/1200	Nonswitched or switched voice grade
3864-1/2	4800/2400	Nonswitched or switched voice grade
3865-1/2	9600/4800	Nonswitched voice grade
3868-1	2400/1200	Nonswitched voice grade
3868-2	4800/2400	Nonswitched voice grade
3868-3/4	9600/4800	Nonswitched voice grade

Modem NPDA Version 3 Release 2

Modem (models)	Speed (bps)	Lines
5865-001	9600	Nonswitched voice grade
5866-001	14400/9600	Nonswitched voice grade
5868-051		Rack mount version of 5865-001
5868-061		Rack mount version of 5866-001

The above modems are supported in ACF/NCP Version 3. The following modems are supported in ACF/NCP Version 4 (LPDA-1 only).

Modem (models)	Speed (bps)	Lines
5865-002,003	9600	Nonswitched

5866-002,003	14400/9600	voice grade Nonswitched
5868-052		voice grade Rack mount version of 5865-002
5868-062		Rack mount version of 5866-002

The following modems are supported in ACF/NCP Version 4 Release 2 (LPDA-1 for 5812s and LPDA-2 for 586Xs)

Modem (models)	Speed (bps)	Lines
5812-10	From 2400 up to 19200	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-002,003	9600	Nonswitched voice grade
5866-002,003	14400/9600	Nonswitched voice grade
5868-052		Rack mount version of 5865-002
5868-062		Rack mount version of 5866-002

Other modems are (not LPDA):

Modem (models)	Speed (bps)	Lines
3872-1	2400/1200	Nonswitched or switched voice grade*
3976-1	200	Nonswitched voice grade
3976-2	300	Switched
3976-3	1200/600	Nonswitched or switched voice grade
5811-10	2400/4800/9600/19200 from 2400 up to 19200 (Sync.)	Nonswitched baseband
5811-20	Up to 9600 (Async.)	Nonswitched baseband
5811-18		Rack mount version of 5811-10
5811-28		Rack mount version of 5811-20
5812-10(*)	Up to 9600 (Async.)	Nonswitched baseband
5812-18(*)		Rack mount version of 5812-18
5811-28		Rack mount version of 5811-20
5821-10	2400/4800/9600/19200	Nonswitched baseband

* The 5812 modems do not support LPDA in Asynchronous Mode.

4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU available on 5865 and 5866 modems with feature #7952 requires half-duplex line operation. See your TCM branch/TP coordinator for country limitations.

RPQ Modems may be attached (refer to M2700 pages for details).

PTT Mandatory Modems meeting CCITT Recommendations V.24, V.28 and ISO Standard 2110 and relevant CCITT recommendations for data transmission speed may connect to the CCITT V.24 Line Attachment.

PTT Mandatory Modems meeting CCITT Recommendation V.35 and ISO Standard 2593 may be attached to Line Set 2 (#6712).

PTT Mandatory Auto Call Units meeting CCITT Recommendation V.25 and ISO Standard 2110 may be attached to Line Set 4 (#6714).

See M2700 pages for details.

Non-IBM Modems may be attached subject to the Multiple Supplier Systems Bulletin.

World Trade Data Networks: Attachment to World Trade Data Networks is supported as follows:

- CCITT V.24 Line Attachment connects to CCITT X.21bis switched and nonswitched networks in Japan.
- Line Set 2 connects to CCITT X.21bis nonswitched in Japan.
- Line Sets 8 & 9 connect to CCITT X.21 switched and non-switched networks in Japan.

EIA RS-232-C/CCITT V.24 Line Attachments

Mdl M81 supports 4 Line Attachments

Mdl M82 supports 10 Line Attachments

Mdl M83 supports 16 Line Attachments

Mdl M84 Supports 10 Line Attachments of:

- 4 - EIA RS-232-C/CCITT V.24 and
- 6 - CCITT X.21 (see Line Set 8 #5657)

The RS-232-C/CCITT V.24 line attachments support lines up to and including 9600 bps using S/S, BSC, or SDLC line protocols. These lines can be duplex or half-duplex using the RS-232-C/CCITT V.24 interface. Half-duplex data transmission requires one address in EP, or NCP; synchronous duplex data transmission requires two addresses in the NCP. For duplex operation (4-wire) specify #9711; for half-duplex operation (2- or 4-wire) specify #9712. Synchronous lines can operate at 19.2K bps using upper scan limit of 16. An upper scan limit of 16 will only scan Line Interface Addresses 20 through 2F. Other Line Interface Addresses will not be scanned.

Each specify code #9711 will cause two line attachments to be installed as duplex and each specify code #9712 will cause two Line Attachments to be installed as half-duplex on the initial installation of the 3705-80 to the limit of the model ordered. If fewer lines are specified than the model allows, the remaining lines will be installed as half-duplex.

To change between Duplex and Half-Duplex mode of operation, order a Record Purpose-Only MES:

- Specify #9720 to change one or more line attachments from duplex to half-duplex.
- Specify #9721 to change one or more line attachments from half-duplex to duplex.

The CE must be provided the MES number from the Record Purpose-Only MES, the Specify Code(s), the Line Interface Address(es) to be changed with each associated Specify Code and reference the VA000A installation instructions. Specify Codes #9712 and #9711 are not recommended for field installation.

Any line attachment can connect to an external modem or directly to a device with one of the following cables. Each line attachment requires one cable.

- Attachment to one external modem requires Cable Group #1404 for each modem.
- Direct attachment (HDX) of a device requires Cable Group: #1399 for S/S, or #1400 for Synchronous (SDLC & BSC) for each device. Check clocking requirements and device requirements for each direct attachment.

For 2740 with Station Control and all other Start/Stop Directly Attached devices CE must install jumpers on the machine as defined in the installation instructions. To change the line attachment to or from Directly Attached Start/Stop operation, order a Record Purpose-Only MES using the appropriate Specify Code for one or more line attachments as follows:

#9722	modem attach or sync attach	to	any S/S direct attach
#9722	2740 w/o station control direct attach	to	any other S/S direct attach
#9722	any other S/S direct attach	to	2740 w/o station control direct attach
#9723	any S/S direct attach	to	modem attach or sync direct attach

The CE must be provided the MES number from the Record Purpose-Only MES, the Specify Code(s), the Line Interface Address(es) to be changed with each associated Specify Code and reference the VA000A Installation Instructions.

Line Attachments and Line Sets: The line sets (LS) and line attachments provide the electronics to meet the requirements of specific communications facilities. The following chart indicates by model, the Line placement and mode of operation by Line Interface Address.

Model	Line Type	Mode	Line Interface A Address							
			2	2	2	2	2	2	2	2
			0	1	2	3	4	5	6	7

Legend:

A: Denotes address used for an autocall interface.
X: Denotes a Transmit/Receive address for a half-duplex line.
.: Denotes an address not used and unavailable.
-: Denotes an address not used and available.
B: Denotes an address blocked by address substitution.
b: Denotes an address not used and available that will be blocked if address substitution used.
TR: Is a Transmit Receive address used on a duplex line and uses two adjacent addresses.
T.R.: Is a Transmit Receive address used on a duplex line and uses two adjacent even addresses.

To change the mode of operation of an RS-232-C/CCITT V.24 Line Attachment, a CCITT X.21 Line Attachment, or the speed of the High-Speed Direct Attachment, use a Record Purpose-Only MES for leased machines using the Specify Codes as defined in the write-ups for each of these functions. Purchased machines submit RPOs.

These mode change Specify Codes #9720, #9721, #9722, #9723, #9724 and #9725 can be ordered only on a Record Purpose-Only MES.

Note: Any change for an optional CCITT V.35 (Line Set 2) or digital (Line Set 3) line attachment must be ordered by MES from the factory. A Record Purpose-Only MES cannot be used.

Direct Attachment: Devices to be connected directly to the 3705-80, without modems, can do so using the EIA RS-232-C/CCITT V.24 line attachment. This line attachment will attach Start/Stop, BSC or SDLC protocols up to 2400 bps. All directly attached devices (at speeds of 2400 bps or less) must have a BMC and the 3705-80 must have a BMC of equal speed.

To attach a device directly to the 3705-80 requires the direct attachment cable group defined under "Line Attachments" and a BMC. The BMC in the 3705-80 must match the speed of the clock in the attached device.

Most devices that attach directly require a feature to be installed in the device. Consult the machines pages of the device for details of the features required.

High-speed Direct Attachment, Line Set 5 (#6715), allows connection of devices to the 3705-80 without modems at speeds of 14.4K bps or 57.6K bps. This LS includes a clock, which is looped out to the device and back to the 3705-80. Therefore, the device does not need a clock.

Submit an RPO for direct attachment of terminals at 3600/7200 bps or 4800/9600 bps.

Remote Communications Controller: The 3705-80 can be used as a remote communications controller (no channel connection to a host processor). This enables the 3705-80 to become a remote concentrator with a communications link to a local 3705 or 3725 communications controller. The remote communications controller

acts as an extension of the local communications controller, passing data over the communications link to the local communications controller and on to the host. For more information on the functions of a Remote Communications Controller, refer to the manual for ACF/NCP/VS.

The Remote Program Loader feature also allows for the 3705-80 to be locally attached with a channel adapter to one host, and attached remotely to another host through a local 3705 or 3725 communications controller. This allows the user to load the NCP from either source, but not at the same time.

Business Machine Clock: A BMC provides the clocking of data in and out of the Communications Scanner. A BMC of 134.5 bps is included in all models. Three additional BMCs can be put in the scanner. A BMC is assigned to a specific line attachment under control of the NCP, or EP. The selection of the speed of the BMC is determined with the following rules:

- No Clocking in the Modems (usually 1200 bps or less), or a Directly Attached Device:
 - All devices that attach to the modems without clocking must have a BMC and the 3705 must have a BMC of equal speed for speeds up to 2400 bps.
 - All Directly Attached Devices must have a BMC and the 3705 must have a BMC at equal speed, when the clocking is in the scanner.
- Clocking in the Modems (usually greater than 1200 bps):
 - When the modem provides the clocking, then the 3705 must have a clock of less than one-half the lowest line speed attached. The BMC of 134.5 bps meets this requirement.
- CCITT X.21 Additional Requirements for BMCs:
 - CCITT X.21 Switched: A switched line must have a BMC speed of less than 1/24th of the operating line speed. At operating speeds of 4800 bps and over, the 134.5 bps basic clock will suffice. At 2400 bps a BMC of 50 bps (#1409) is required. A BMC with a speed of 2400 bps (#1416) is also required.
 - CCITT X.21 Nonswitched: A BMC with a speed of 2400 bps (#1416) is required for testing. This BMC is in addition to the required BMC which is less than one-half the line speed. The Basic BMC of 134.5 bps meets the requirement of less than one-half the lowest line speed.

BMC Feature Codes

Feature	Speed (bps)
#1409	50
#1410	110
#1412	200
#1413	300
#1414	600
#1415	1200
#1416	2400

An RPQ may be submitted for other speeds. Field installation: Yes. Maximum: Four clocks per machine.

Performance: The 3705-80 is a 4-, 10- or 16-line communications controller. The following is a definition of line parameters and NCP parameters that allow 16 lines to run in the 3705-80 with a CA1. If the communications system matches these parameters, it will run. It is always advisable to run the HONE Configurator (CF3705) to get a performance analysis.

SDLC Operation: NCP Parameters:

Dynamic Reconfiguration
RAS Options:
Address trace

Auto network shutdown
Systemabend
Channel attention delay
3863, 3864, 3865 Modems for LPDA
ACF/NCP/VS R3

Line Parameters:

Message size: 25 characters in, 256 characters out
Half-duplex SDLC data transmission (if duplex data transmission then: 16-4800 bps lines, or 8-9600 bps lines)
Message rate: 0.782 msg/sec
9600 bps line speed
2-3270 control units per line
8-logical units per line
Parameters as used in CF3705:
Propagation delay: 40 milliseconds
Number of entries in service order table: 2
Min. time between poll cycles: 0.5 sec.
Line turnaround time: 8.5 milliseconds
Input data per SDLC response: 1
Output data per SDLC response: 1
NCP buffer size: 240 bytes

BSC Operation: NCP Parameters:

Dynamic Reconfiguration
All available RAS options
3863, 3864 or 3865 Modems used for LPDA
ACF/NCP/VS R3

Line Parameters:

Message size: 25 characters in, 256 characters out
Half-duplex BSC operation
Message rate: 0.782 msg/sec.
9600 bps line speed
2-3270 control units per line
8-logical units per line
Parameters used in CF3705:
Propagation delay: 40 milliseconds
Number of entries in service order table: 2
Min. time between poll cycles: 0.0 sec.
Line turnaround time: 8.5 milliseconds
NCP buffer size: default 64 bytes

High-Speed Operation: A generalized pre-definition of performance with a high-speed line (over 9600 bps) is difficult because a parameter change can cause a significant change in performance. Therefore, it is recommended that the HONE Configurator (CF3705) be used when using a high-speed attachment to predict performance of the 3705-80.

The following specific configuration will run:

SDLC with Address Substitution used. One 56K bps duplex line will run with ten 4800 bps half-duplex lines as defined above for SDLC. Other lines may run but CF3705 should be used to check this possibility.

Message size: 2,000 characters in, 2,000 characters out.
Messages per second: 0.875 in and out.
Data throughput at 3,500 characters per second.
3705 to 3705 with virtual route pacing 1 for 6 PIUs (FID4).
Parameters used in CF3705 as defined above except propagation delay of 20 milliseconds.
The Hone Configurator (CF3705) must be run for PEP configuration.

SPECIFY

- Power (AC, 3-phase, 4-wire): 4.3m (14 ft) cable, or specify #9986 for 1.8m (6 ft) cable (208/230V, 60 Hz only), and:

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905

380V #2816
408V #2819

- Specify #2747 for machines to be installed in Japan. Field Installation: Yes (except 200V or frequency conversion).
- Specify #2998.
- Color: Specify #9060 for willow green, #9061 for garnet rose, #9062 for sunset yellow, #9063 for classic blue, #9064 for charcoal brown, #9066 for pearl white. Field Installation: Not recommended.
- Prior to submitting an MES order, the CE Branch Manager should be consulted for any software or hardware compatibility requirements resulting from the order.
- Machine Nomenclature: The operator panel language will be determined by one of the following specify codes. If one of the following is not specified, all countries will receive English. Warning labels will be shipped as defined for the following countries. Other countries can order using the specify codes below:

Country	Code	Warning Labels	Panel	Specify
Canada	649	English/ Canadian French	Eng.	#2934
France	706	French	Fr.	#2928
Germany	724	German	Ger.	#2929
Italy	758	Italian	Eng.	#2932
Japan	760	Japanese	Eng.	#2930
Spain	838	Spanish	Eng.	#2931

- Cables: The cables that are included in each line set are listed in the "IBM Input/Output Equipment Installation Manual - Physical Planning", GC22-7064. These cables must be ordered separately from the 3705 machine order on a cable order.

To obtain cables longer than 15m (50 ft) select the required cable below and order the cable assembly P/N and the required cable length in meters. These(Except Canada> longer cables are ordered by P/N on an MES.<) (Canada only> longer cables are ordered by P/N on cable order Form 2642.<) The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the (Except Canada>QSLM file<) (Canada only> FED parts price list<) for prices.

To order a cable for a CCITT V.35 Interface Modem Attachment:

Duplex (Line Set 2 #6712)
Order cable assembly P/N 1648394 (See Note 1)
Half-Duplex (Line Set 2 #6712)
Order cable assembly P/N 5997479 (See Note 1)

To order a cable for a Autocall Originate (RS-366/CCITT V.25) Interface Attachment:

(Line Set 1E #4715)
Order cable assembly P/N 1753439 (See Note 2)

Notes:

- Maximum Length: 30m (100 ft).
- Maximum Length: 45m (150 ft).

To order a cable for a EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The 3705 Communications Controller can now support a cable length of up to 100m when connecting to a 3863, 3864, or 3865 modem or equivalent. Cable lengths up to 15m (50 ft) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications.

To connect a cable longer than 15m (50 ft) the following must be done:

- Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.

- If the suffix is "DG" or earlier:

A 3863 or 3864 modem or a 3865 modem which does not have Data Multiplexer #3260 installed must have EC 344120 installed.

A 3865 modem with Data Multiplexer #3260 installed must have EC 323406 installed.

- Order a cable:

Duplex or Half-Duplex Line Attachment, order cable assembly P/N 1736733.

Maximum length is 100m (328 ft).

SPECIAL FEATURES

(No Longer Available for Models M81, M82, and M83 after December 31, 1986)

Non-Communications Features

Remote Program Loader (#6261): This optional feature provides the means of remotely loading the NCP. Limitations: One per 3705-80. Cannot exist with second #1544. Field Installation: Yes.

Two-Channel Switch (#8002): This optional feature will connect to two S/360, S/370, 303X or 4300 Processor channels, which may be on the same host, or on a different host. Selection of which channel is used is by a manual switch on the control panel which will enable one channel at a time. Additional channel cables must be ordered with this feature. Limitations: One. Cannot be installed if two CAs are installed. Field Installation: Yes.

Communications Features

Channel Adapter Type 1 (CA1) (#1551): Provides the interface between the 3705-80 and a S/370, 303X or 4300 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA1 communicates with the processor byte multiplexer channel with 1, 2, 3, or 4-byte transfers. Maximum: One. Field Installation: Yes.

Channel Adapter Type 4 (CA4) (#1544): Provides the interface between the 3705-80 and S/370, 303X, 4300, or 9370 Processors. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 in Emulation mode only. There are two modes of operation of a CA4:

- The CA4 operates like a CA1 and transfers one, two, three, or four bytes of data on the byte multiplexer channel.
- Cycle Steal Mode increases the throughput of the ACF/NCP/VS program product. Up to 248 bytes of data can be transferred across the block or selector channels.

Only one mode of operation can be used at any time. Maximum performance is obtained with the cycle steal mode of operation. The CA4 can connect to the byte multiplexer channel (like the CA1), the block multiplexer channel, or the selector channel. To run the emulator program, the CA4 must be attached to the byte multiplexer channel. Dual CA4s can connect to different channel types and each CA4 can operate in a different mode. Limitations: The first CA4 cannot exist with a #1551 and the second CA4 cannot exist with a #1551 or a #6262. Field Installation: Yes.

Line Set 8 (LS8) (#5657): (9600 bps CCITT X.21 Attachment) This LS provides for attachment of two duplex switched or nonswitched, or two half-duplex nonswitched synchronous lines at speeds of 2400 bps, 4800 bps or 9600 bps. For switched operation specify #9775; for

nonswitched operation specify #9777. Each specify applies to the entire LS. A switched line must have a BMC at less than 1/24th of the operating line speed. Another BMC of 2400 bps (#1416) is required for testing. Cable Group #1391 is required to attach each line. Limitations: One LS per machine. Field Installation: Yes. Use a Record Purpose-Only MES to change between switched and non-switched operation after initial installation. #9775 and #9777 are not recommended for field installation; use only on initial machine order. See the beginning of this section for more detail. Switched operation requires ACF/NCP R3. LS8 cannot be installed with #6712, #6713, #6714, #6715 or #5658. Not available on mdl M83.

Line Set 9 (LS9) (#5658): (48K bps CCITT X.21 Attachment) This LS provides for attachment of one duplex switched or nonswitched, or one half-duplex nonswitched synchronous line at 48K bps. For switched operation specify #9776; for nonswitched operation specify #9778. Each specify applies to the entire LS. A switched line must have a BMC at less than 1/24th of the operating line speed. Another BMC of 2400 bps (#1416) is required for testing. Cable Group #1391 is required to attach to each line. Limitations: One LS per machine. Must use Address Substitution. For a mode change, order a Record Purpose-Only MES with specify code #9776 for a nonswitched to switched mode change or #9778 for a switched to nonswitched mode change. The CE must be provided the MES number from the Record Purpose-Only MES, the specify code indicating the mode change being performed and to reference the VA000A installation instructions. Switched operation requires ACF/NCP R3. LS9 cannot be installed with #6712, #6713, #6714, #6715 or #5657. Not available on mdl M83. Field Installation: Yes.

Line Set 2 (LS2) (#6712): (56K bps CCITT V.35 Attachment) This LS provides for the attachment of one duplex, or two half-duplex synchronous lines, which have a CCITT V.35 type interface with lines speeds up to 56K bps (this includes line speeds of 19.2K bps and 48K bps). Half-duplex data transmission requires one even address in EP or NCP (adjacent odd addresses will be assigned); duplex data transmission requires two even addresses in NCP (adjacent odd addresses will be assigned). For duplex operation specify #9713; for half-duplex operation, specify #9714. Each specify applies to the entire line set. This LS in duplex mode is used with a LS 1Z in a 3705-II for direct attachment at 14.4K bps, or 57.6K bps; in half-duplex mode it connects to LS 1W. This LS also connects to #6715 in another 3705-80 in half-duplex mode. To attach this LS to an external modem requires one of the following cables: Attachment to a duplex line requires Cable Group #1497. Attachment to a half-duplex line requires Cable Group #496 for each modem. Limitations: One line set per machine. Uses address Substitution. A Record Purpose-Only MES does not apply. LS2 cannot be installed with #6713, #6714, #6715, #5657, or #5658. Not available on mdl M83. Field Installation: Yes.

Line Set 3 (LS3) (#6713): (50K bps Digital Attachment) This LS provides for attachment of one duplex synchronous line, or two half-duplex synchronous lines which have a high-speed digital interface. This LS attaches to an external modem for speeds up to 50K bps on nonswitched, or switched wideband facilities (not program supported for switched facilities). For duplex operation, specify #9715; for half-duplex operation, specify #9716. Each specify applies to the entire LS. This includes operation at 20.4K bps, 24K bps, 40.8K bps, 48K bps or 56K bps. Half-duplex data transmission requires one even address in EP, or NCP (adjacent odd address will be assigned); duplex data transmission requires two even addresses in NCP (adjacent odd addresses will be assigned). To attach to the high-speed digital interface requires Cable Group #489 for each modem attachment. Limitations: One LS per machine. Uses Address Substitution. A Record Purpose-Only MES does not apply. LS3 cannot be installed with #6712, #6714, #6715, #5657 or #5658. Not available on M83. Field Installation: Yes.

Line Set 4 (LS4) (#6714): (Auto Call Attachment) This LS supports four RS-366-A/CCITT V.25 interfaces for attachment of external automatic calling units. Each auto call unit works with an EIA RS-232-C/CCITT V.24 line attachment. Two Cable Groups #486 to connect to four External Auto Call Units are required. Limitations: One LS per machine. LS4 cannot be installed with #6712, #6713, #6715, #5657, or #5658. Not available on mdl M83. Field Installation: Yes.

Line Set 5 (LS5) (#6715): (57.6K bps Direct Attachment CCITT V.35) This LS provides for local attachment of two half-duplex synchronous devices which have a CCITT V.35 interface. Clocking is provided. Specify #9832 for 57.6K bps or #9830 for 14.4K bps. The attached device must be set for external clock control. The total cable length must not exceed 60m (200 ft) at 14.4K bps operation, and 30m (100 ft) at 57.6K bps operation. The total length includes the attached device cable length. Each specify applies to the entire LS. This LS can connect to a LS 2 in another 3705-80 in half-duplex mode. Cable Group #1394 is required to attach each device. Limitations: One LS per machine. Uses Address Substitution. For a speed change, order a Record Purpose-Only MES with specify code #9832 for a 14.4K bps to 57.6K bps, or #9830 for a 57.6K bps to 14.4K bps. The CE must be provided the MES number from the Record Purpose-Only MES, the specify code indicating the speed change and to reference the VA000A installation instructions. LS5 cannot be installed with #6712, #6713, #6714, #5657, or #5658. Not available with mdl M83. Field Installation: Yes.

3705-M84: The 3705-M84 has ten line attachments. The four CCITT V.24 lines should have duplex (#9711) or half-duplex (#9712) specified on the initial order. All CCITT V.24 lines not specified will be shipped as half-duplex. The six CCITT X.21 lines should have either switched (#9775), or nonswitched operation (#9777) specified on the initial order. All CCITT X.21 lines not specified will be shipped as switched lines. One specify code applies to two lines. To change the mode of operation on the M84, follow the procedure outlined for CCITT V.24 lines and the following procedure for CCITT X.21 lines.

CCITT X.21 Line Attachments: #9775 and #9777 are not recommended for field installation. To change the mode of operation between switched or nonswitched operation on CCITT X.21 lines, order a Record Purpose-Only MES: Specify #9724 to change one or more line attachments from nonswitched to switched. Specify #9725 to change one or more line attachments from switched to nonswitched. The CE must be provided the MES number from the Record Purpose-Only MES, the specify code(s), and the Line Interface Address(es) to be changed with each associated Specify Code, and reference the VA000A installation instructions.

MODEL CONVERSIONS

(No Longer Available for Models M81, M82, and M83 after December 31, 1986)

The following 3705-80 model conversions are field installable. Other model conversions are not recommended.

Models	Conversion Time
M81 to M82	5.9 hours
M82 to M83	3.4 hours
M81 to M83	7.9 hours
M81 to M84	7.5 hours

- EIA RS-232-C/CCITT V.24: All Line Attachments will be shipped in half-duplex mode on model conversions. Do not use specify codes #9711 or #9712.
- CCITT X.21: Line Attachments will be shipped in switched mode on model conversions. Do not use specify codes #9775 or #9777.

ACCESSORIES

(No Longer Available for Models M81, M82, and M83 after December 31, 1986)

Keys: The 3705-80 with Operator Panel Lock is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (NONE)

3708 NETWORK CONVERSION UNIT

PURPOSE

The 3708 Network Conversion Unit is an advanced networking product which concurrently provides line concentration, protocol conversion, protocol enveloping, and ASCII pass-through for attached ASCII/asynchronous devices. An ASCII/asynchronous terminal attached to a 3708 can use host applications that support full screen 3270 displays and printers. IBM host applications can also communicate through the 3708 with devices which otherwise would connect through the Network Terminal Option (NTO) licensed program running on a 37X5. ASCII/asynchronous terminals can also connect through the 3708 to an ASCII host application.

DESCRIPTION

A total of ten ports is provided for host and terminal attachment. The 3708 can be multidropped on an SNA/SDLC line with other SNA controllers. It provides SNA networking facilities and CNM support when operating with SNA hosts and applications.

Attachment to one or two IBM host processors using the SNA/SDLC protocol is provided. The 3708 also provides the capability for an ASCII display to communicate point-to-point with an ASCII host processor in pass-through mode. ASCII/asynchronous devices may be attached to a 3708 directly at distances up to 4,000 ft or remotely via switched or nonswitched lines. ASCII hosts must be attached to the 3708 via an EIA RS-232-C interface, either directly or via non-switched lines.

The 3708 does not require any new or unique IBM host software. The 3708 will operate with IBM SNA based MVS, VM, and VSE host programs which support the 3274-51C or 61C with Configuration Support A. The 3708 can also perform the functions of NTO to IBM SNA applications which support the NTO licensed program. For terminals attached in this mode, it is not necessary to have NTO installed in the 37X5. The 3708 is also supported by the SNA communication network management product NetView.

When the 3708 is used to connect an ASCII display to an ASCII host via pass-through, the 3708 is transparent to both ends. Any menu-selectable ASCII display terminal can attach through the 3708 to an ASCII host which supports that terminal.

IBM systems to which the 3708 can attach include: System/370, 43XX, 30XX, and 9370 operating with a 3705, 3725, or 3720 Communication Controller, a 4361, 4331, or 4321 through the Communication Adapter (CA), a 9370 via the Telecommunications Subsystem Controller, an 8100 via the Data Link or Direct Attach, a System/36 or System/38 via the Communication Attachment, using the 3274 Remote Attach Support, and a 4701 Model 003 Finance Communication Controller or 4702 Branch Automation Processor (using the Alternate Line Attachment Adapter, SNA Primary. The 3708 can attach to a 3710 Network Controller. The 3708 can also be attached to one or more ROLM CBX II 8000 or 9000 systems.

The 3708 also provides for configuration, monitoring and problem determination through the attachment of a user-provided control terminal. The control terminal may be any one of the menu-selectable ASCII display terminals. The control terminal may either be directly attached to the 3708 or remotely attached via a switched or nonswitched line.

The 3708 Pluggable Cartridge with Central Site Configuration is an enhanced cartridge that enables the centralized control of the operational characteristics of the 3708 Network Conversion Units. The Pluggable Cartridge with Central Site Configuration is used instead of the current Pluggable Cartridge. A central site configuration aid that runs on an IBM Personal Computer is included with the Pluggable Cartridge with Central Site Configuration. The Pluggable Cartridge with Central Site Configuration also includes all of the function of the Pluggable Cartridge.

MODELS

Model 001

Customer Setup: The 3708 is designed to be setup by the customer. During the Customer Setup (CSU) process the customer verifies, using the internal diagnostics, that the 3708 hardware is operational. The customer must then configure the 3708 to allow host/device attachment. The configuration data reside in non-volatile storage in the 3708 and are retained should a power failure occur. The 3708 comes pre-configured to allow the control terminal access.

HIGHLIGHTS

- Supports line concentration, protocol conversion, protocol enveloping and ASCII host pass-through concurrently
- Supports IBM Personal Computers with PC/HOST File Transfer and Terminal Emulator Program (FTTERM).
- Supports IBM Personal System/2 family of personal computers and ProPrinters.
- Provides easy to use menus to allow a terminal user access to one of two possible IBM host processors or one of multiple possible ASCII host processors
- Extends SNA networking capabilities to 3708-attached ASCII terminals
- Extends CNM support by providing alerts and collecting performance statistics
- Supports an easy to use control terminal for menu-driven remote or local management of the 3708
- Provides an optional Pluggable Cartridge with Central Site Configuration that enables the centralized storage, updating and distribution of 3708 configuration information and micro-code changes.
- Supports a wide variety of popular ASCII/asynchronous display terminals
- Supports switched ASCII devices connected to the ROLM CBX II 8000 and 9000
- Allows up to six "User-Defined Terminals" to support keyboard mappings not supplied by IBM
- Provides a 7171 compatible translate table and a user-definable translate table to be used in ASCII-to-EBCDIC and EBCDIC-to-ASCII character translation.
- Saves configuration information in non-volatile memory, where it will not be lost in the event of a power failure.
- Supports the 3270 status line, highlighting and 4-color features
- Provides type-ahead key queuing and enhanced null/blank processing
- Supports ASCII printers in three modes: System print, local copy and shared printing
- Permits a display with an attached printer to share a single port in protocol conversion mode
- Supports line speeds from 110 to 19.2K bps
- Provides device attachment using the CCITT V.24/EIA RS-232-C interface for direct or remote attachment or the CCITT V.11/EIA RS-422-A interface for direct attachment of ASCII displays up to 1,219m (4,000 ft) away

- Provides auto baud/auto parity and auto answer/auto disconnect
- Supports optional port passwords
- Enhances customer problem determination capability by supporting remote diagnostic assistance by IBM support specialists

Standard Features: The 3708 Network Conversion Unit is composed of:

- One 3708 base unit - model 001
- One power cord - 4.3m (14 ft) is standard and will be shipped with the 3708. If a 1.8m (6 ft) power cord is required, specify #9986
- One CCITT V.24/EIA RS-232-C Wrap Plug
- One #3524, Pluggable Cartridge, or one #3525, Pluggable Cartridge with Central Site Configuration. (Note: At least one cartridge #3524 or #3525 must be ordered. Additional cartridges #3524 or #3525 may be ordered via MES using P/N 6405322 or P/N 6405473).

Customer Replacement Parts: The following parts must be purchased by the customer when a replacement is needed.

Order through Branch Office Parts Station and/or Field Part Distribution Centers to NSD Greencastle or the customer directly places orders to the IBM Parts Order Center in Greencastle.

RS-232-C wrap plug 6405345
14 ft power cord * see below
Field packing material 6165643

Ordering Spare Cartridges: Cartridges may be ordered by P/N in any quantity to provide spare cartridges as required by the customer. Cartridges purchased as spare units are eligible only for IBM Hourly Service coverage after warranty. Cartridges are not eligible for volume discounts if ordered as spares.

Pluggable Cartridge: 6405322

Pluggable Cartridge with Central Site Configuration: 6405473

Warranty/Maintenance for Spare Elements: (Countries with Repair Center Capability) Spare elements are covered under a one (1) year warranty. The specific service offering for this warranty is Customer On-site Exchange. < >

(Countries without Repair Center capability) Spare elements are covered under a one (1) year warranty. The specific service coverage for this warranty is IBM On-site Repair. < >

Maintenance for spare machine elements, after the warranty period, is available on an IBM Hourly Service basis at an IBM Repair Center. A minimum charge is applied.

Security: User access to the 3708 can be controlled by requiring users to enter a password in order to gain access to a port. Passwords are assigned from the control terminal, and can be different for each port. Each 3708 port can optionally be configured without port passwords so that IBM host application passwords are all that is necessary to logon. Access to hosts and printer can be defined through the configuration.

SNA session security is supported. When an ASCII device is in session with an IBM SNA host and either disconnects or exceeds the configurable inactivity timer the 3708 will terminate the session. Another device is NOT allowed to dial into a port and gain access to a SNA session which was previously defined, but not yet terminated. Session disconnect from the IBM SNA host is also supported. If the IBM SNA host subsystem or application supports the NOTIFY command, the 3708 provides power on/off notify whenever the terminal connects/disconnects or is timed out by the 3708 due to inactivity.

The 3708 cannot provide security for host subsystems or applications (such as IMS) which retain data between sessions in the expectation that when the same logical unit comes into session again, it will still be same terminal and user. For example, IMS maintains the conversation even though the session with a workstation was

ended. Subsequent access to the same port of the 3708 by a different workstation would allow a new user access to the data queue established during the previous session.

Customer Responsibilities: The customer is responsible for:

- Ordering the following manuals for setup and planning:
 - "IBM 3708 Network Conversion Unit Planning and Installation" (GA27-3766)
 - "IBM 3708 Network Conversion Unit Problem Determination" (GA27-3767)
 - "IBM 3708 Network Conversion Unit Description" (GA27-3768)
 - "IBM 3708 Network Conversion Unit End-User Reference" (GA27-3765)
 - "IBM 3708 Network Conversion Unit Configuration Samples" (GA33-6000)
 - "IBM 3708 Network Conversion Unit Reference Cards" (Keyboard Reference Cards for the supported terminals). Form numbers are listed in the "IBM 3708 Network Conversion Unit Planning" manual.
- Adequate site preparation and planning for the port configurations and physical security of the 3708
- Procurement of all communication cables for IBM host, ASCII host and ASCII/asynchronous device attachment
- Receipt at customer's receiving dock, unpacking and placement of the 3708
- Setup of the 3708 and connection of cables to communication lines, modems and processors
- Setup of the modems and attached devices
- Identifying and supplying a suitable ASCII display terminal or Personal Computer to be used for entering configuration data
- Configuration of the 3708
- IBM SNA host "system generation" to accommodate the 3708
- Verifying that equipment operating with the 3708 meets customer criteria
- Price quotations, installation and cost of common carrier equipment and service
- Determining 3708 spare equipment requirements
- Performing Customer Problem Analysis and Resolution

Providing a telephone line and a 1200 bps, auto-answer, duplex, (Canada only) > 212A < compatible stand-alone modem with auto-answer, such as the 5841, to obtain remote IBM assistance.

Cables: Order cables by MES, using the MSORDER transaction and order as CABLES.

- All external cables, both CCITT V.24/EIA RS-232-C DTE and DCE standard length cables and CCITT V.11/EIA RS-422-A variable length cables.

All external cables for the 3708 must be ordered separately and are chargeable items. Allow a lead time of at least two weeks for fixed length RS-232-C cables and four weeks for variable length RS-422-A cables.

Procurement of equivalent cables through an alternate vendor is the customer's responsibility. Cables should be shielded. See the publication "3708 Network Conversion Unit Planning and Installation" (GA27-3766) for cable descriptions and specifications.

See "Accessories" for details.

Publications: The following publications ship with the 3708:

- "IBM 3708 Network Conversion Unit Setup" (GA27-3611)
- "IBM 3708 Network Conversion Unit Problem Report" (GA27-3638)

"IBM 3708 Network Conversion Unit Registration Address Form"

The following publication is available from Mechanicsburg at announcement: "IBM 3708 Network Conversion Unit Planning and Installation" (GA27-3766)

The following publication will be available two weeks prior to General Availability: "IBM 3708 Network Conversion Unit Planning and Installation" (GA27-3766)

The following publications will be available at General Availability:

"IBM 3708 Network Conversion Unit Planning and Installation" (GA27-3766)

"IBM 3708 Network Conversion Unit Problem Determination" (GA27-3767)

"IBM 3708 Network Conversion Unit Configuration Samples" (GA33-6000)

"IBM 3708 Network Conversion Unit Reference Cards" (Keyboard Reference Cards for the supported terminals)

Form Numbers are listed in the "IBM 3708 Network Conversion Unit Planning and Installation" manual.

SPECIFIED OPERATING ENVIRONMENT

Hardware Requirements: The 3708 is designed to operate in a standard office environment either directly or remotely attached to one of the following IBM products:

- 3705, 3720, 3725 - Communication Controller (attached to a 3090, 308X, 303X, 43XX, or System/370)
- 3710 - Network Controller
- 9370 - Communication Adapter
- 4361 - Communication Adapter (ICA)
- 4331 - Communication Adapter (ICA)
- 4701 Model 003 - Finance Communication Controller
- 4702 Branch Automation Processor
- 4321 - Communication Adapter (ICA)
- 8100 - Data Link Attach
- 9370 Telecommunications Subsystem Controller
- S/36 - Communication Attachment (using the S/36 3270 Remote Attachment Support)
- S/38 - Communication Attachment (using the S/38 3274 Remote Attach Support)
- ROLM CBX II - 8000 Business Communication System
- ROLM CBX II - 9000 Business Communication System

Attachment to the 4361, 4331 and 4321 Communications Adapter (CA), the 9370, and the System/36 and System/38 is supported in protocol conversion mode only.

The 3708 is designed for customer setup. All of the 3708's micro-code is contained in the pluggable cartridge. The 3708 may be used for either table top or rack mounted operation.

Software Requirements

Host Software Support: The IBM 3708 is designed to operate in an existing SNA network without any new or additional host software requirements. The 3708 permits users to attach to any application on the supported operating systems that currently supports the IBM 3274-51C or 3274-61C (SNA) under Configuration Support A. Certain 3270 keys and functions are not supported. They are:

- ALT CURSOR
- APL/TEXT
- ASCII option
- Attribute select keys
- Clicker on/off
- Compression of symbol definition bit strings
- Encrypt/decrypt
- Extended data streams

- IBM 3274 log/test facility
- Katakana
- Light-pen
- Magnetic readers
- Mono/dual case control of IBM 3278 Printer
- More than 4-color support
- Programmed symbols
- Screen sizes larger than 1920 characters
- SFAP options

- SI print order
- Test request read
- User-defined alerts

Host Software Attachment: The 3708 attaches to ACF/NCP V2 or V3 in a 3705, ACF/NCP V2, V3, or V4 in a 3725, and to ACF/NCP V4 in a 3270.

If the host operating system is MVS/XA, MVS/370, VSE SP1.1 or VSE SP2.1 the 3708 is supported by ACF/VTAM V2 and V3. If the host operating system is VM/SP R4 (with or without HPO), the 3708 is supported by ACF/VTAM V3 for VM/SP. The 3708 is supported by ACF/TCAM V3 and ACF/TCAM V2R4. ACF/TCAM V2R4, with the MSNF feature, supports the 3708 for device to application (LU-LU) sessions. However, SSCP ownership of 3708 PUs and LUs must be provided by a VTAM host.

When the 3708 is attached to an 8100, it is supported by DPPX/SP R3. Considerations for attachment to an 8100 system are found in the 3708 Network Conversion Unit Planning manual.

On a System/38, the 3708 is supported by CPF R7 and the System/38 3274 Remote Attach Support. System/36 support is provided via the Communication Attachment (using System/36 3270 Remote Attachment Support). The 3708 is supported by System Support Program Release 5 and the System/36 3270 Remote Attach Support.

4700 support is provided via the 4701 Model 003 - Finance Communication Controller or 4702 Branch Automation Processor (attachment to 4700 is via the Alternate Line Attachment Adapter, SNA Primary). Configure the 3708's upstream prot for "TERMSELF" instead of "UNBIND". This 3708 configuration option is supported by the 3708 cartridge EC A58775, available in January 1987.

Other host subsystems and applications which support the 3708 are:

- NetView
- NCCF - V2R1, V2R2
- NPDA - V3
- NLDM - R2, R3
- CICS - R1.6
- IMS - R1.3
- TSO - R1.1
- PROFS - R2.2
- NRF with ACF/NCP V4
- MXXX

The 3708 in protocol conversion mode appears as a 3274-51C or 61C to IBM SNA host programs (e.g., IMS, CICS, TSO and CMS) and 3274 application programs. The 3708 also presents an NTO interface to an IBM SNA host and customer applications that previously required the NTO licensed program.

Device Attachment: The display terminals mentioned in this document are products of the following companies and have been tested at the level defined by the following documentation:

- VT52, VT100 - "User Guide VT100", by Digital Equipment Corporation, dated June 1981 (third edition), Catalog #EK-VT100-UG-003.
- VT220 - "VT220 Owner's Manual", by Digital Equipment Corporation, dated Sept 1983 (first edition), Catalog #EK-VT220-UG-001.
- TeleVideo 910 - "TeleVideo Model 910 CRT Terminal Installation and User's Guide", by TeleVideo Systems, Inc. (document #B2002500 Revision D), April 1983 edition.
- TeleVideo 950 - "TeleVideo Model 950 CRT Terminal Installation and User's Guide", by TeleVideo Systems, Inc. (document #B300002-001 Revision B), April 1982 edition.

- Beehive ATL-078 - "ATL-078 Technical User's Manual", (document #TM0184-0006-1) dated April 1984 revised 7/84, version 1.1 by Beehive Int.
- Lear Siegler ADM 3A - "ADM 3A Dumb Terminal Video Display Unit User's Reference Manual", by Lear Siegler, Inc. (document #DP2190683F), June 1983 edition.
- ADDS Viewpoint - "ADDS Viewpoint User's Manual", by Applied Digital Data Systems, Inc., document 518-30000, dated January 19, 1981, revised May 1981.

- Teletype 5420 - "5420 Buffered Display General Technical Reference", by AT&T Teletype Corporation, March 1984 edition (document #SD5420-401).
- Northern Telecom Displayphone - "Displayphone Telephone and Data Terminal Reference Manual", by Northern Telecom (publication #P5849), Revision A, dated February 1984 (firmware release AA07) and "Displayphone Telephone and Data Terminal User Guide", by Northern Telecom, (publication #P5840), Revision F, 1983.
- Hewlett Packard 2621B - "Hewlett-Packard Interactive Terminal 2621B Owner's Manual", by Hewlett-Packard Company (document #02620-90062U1282), Revision 1, December 1982.
- Data General D210 - "Dasher D210/211 Display Terminal User's Manual", by Data General Corporation (document #014-000746-01), Revision 1, February 1984.

Pluggable Cartridge with Central Site Configuration

Specified Operating Environment

Hardware Requirements:

- IBM Network Conversion Units must have either a Pluggable Cartridge (#3524) or a Pluggable Cartridge with Central Site Configuration (#3525) to operate. The enhanced configuration management and microcode change distribution is provided only with the Pluggable Cartridge with Central Site Configuration.
- An IBM Personal Computer with:
 - A 5.25 inch diskette drive
 - A hard disk
 - An IBM Color/Graphics or Monochrome adapter attached to an 80-column display
 - A minimum of 512K of storage
 - Telecommunications equipment and facilities (switched, non-switched, or direct connect) as required to provide:

Asynchronous data communication with an IBM 3708 downstream port configured as a control terminal port to send/receive configuration information or the microcode patch area to/from the IBM 3708

File transfer to the IBM SNA host processor to send the NetView CLISTs for downloading to the IBM 3708s

Software Requirements:

- IBM Personal Computer DOS Version 2.0 or later
- EZ-VU Runtime Facility Version 2 (6317025)

Optional Software:

The IBM 3708 central site configuration aid can prepare configuration information in the form of NetView CLISTs for downloading via the SNA host link to the IBM 3708. The following host programs support this mode of operation:

- NetView
- NCCF Version 2 Release 2

The customer must provide file transfer software support between the IBM Personal Computer and the SNA host.

Added diagnostic capability can be provided through the use of the IBM Personal Computer and the central site configuration aid running in "control terminal" mode. In this mode, the IBM Personal Computer can retrieve the alerts and error logs. The software that can support this mode of operation is:

- IBM 3101 Emulator Program (6024-042)
- PC/HOST File Transfer and Terminal Emulator Program (6476-052)

640KB of memory on the IBM Personal Computer is required to support this function.

ATTACHMENT INTERFACES

IBM SNA Host Attachment: IBM systems to which the 3708 can attach include:

- System/370
- 4341, 4381, 9370, and 30XX operating with a 3705, 3725, or 3720 Communication Controller
- 4361, 4331, or 4321 through the Integrated Communication Adapter (ICA)
- 4701 Model 003 - Finance Communication Controller
- 4702 Branch Automation Processor
- 8100 via the Data Link or Direct Attach
- 9370 Telecommunications Subsystem Controller
- S/36 - Communication Attachment (using the S/36 3270 Remote Attachment Support)
- S/38 via the Communication Attachment, using the System/38's 3274 Remote Attach Support.

The 3708 can also attach to an IBM 3710 Network Controller.

The 3708 is implemented as an SNA physical unit - type 2. This is the same as the IBM 3274-51C/61C Display Control Unit and permits the 3708 to be multidropped on the same SNA/SDLC line with other SNA devices.

The IBM host can be attached to the 3708 via a direct connection or via a communication link (either nonswitched point to point or multipoint). Communication is half-duplex on either half-duplex or duplex communication facilities. Connection is via a standard CCITT V.24/EIA RS-232-C interface. Data rates up to 19.2K bps currently on each upstream link to the IBM SNA host(s) are supported where facilities and support are available. Internal and external clocking and both NRZI and NRZ are supported. See the M2700 pages for facilities.

IBM modems that the 3708 can be attached to include:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1	2400/1200	Nonswitched voice grade
3864-1	4800/2400	Nonswitched voice grade
3865-1/2	9600/4800	Nonswitched voice grade
3868-1	2400/1200	Nonswitched

3868-2	4800/2400	voice grade Nonswitched
3868-3/4	9600/4800	voice grade Nonswitched
5811-10	2400/4800/ 9600	voice grade Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400/4800/ 7200/9600	Nonswitched baseband
5811-28		Rack mount version of 5811-20
5812-10	2400/4800/ 7200/9600	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-2/3	9600/7200/ 4800	Nonswitched voice grade
5866-2/3	14400/9600	Nonswitched voice grade
5868-51/52		Rack mount version of 5865-2
5868-062		Rack mount version of 5866-1/2

Note: 4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

The IBM 5841 can be used on the ASCII links at speeds up to 1200 bps. The IBM 1200 bps internal modem can be used with IBM Personal Computers attached to a 3708. All of these modems are attached via an EIA RS-232-C interface.

ASCII Host Attachment: The 3708 can be attached to one or more ASCII hosts. Attachment can be direct connection or via a non-switched point to point communication link. Data rates of up to 19.2K bps are supported. Connection is via a standard CCITT V.24/EIA RS-232-C interface. The CCITT V.11/EIA RS-422-A interface is not supported. Duplex communication facilities are required. Clocking is internal only.

ASCII/Asynchronous Device Attachment: Attachment characteristics of ASCII/asynchronous devices can be either direct or point-to-point nonswitched or switched. Auto answer/auto disconnect are supported. Data rates from 110 to 19.2K bps are supported. Auto baud recognition (auto baud/auto parity) is provided for devices on switched lines at speeds up to and including 9.6K bps. The 3708 supports both the CCITT V.24/EIA RS-232-C interface and the CCITT V.11/EIA RS-422-A interface for attaching devices. For direct attachment the distance between the attaching devices is up to 15m (50 ft) for a CCITT V.24/EIA RS-232-C connection and up to 1,219m (4,000 ft) for a CCITT V.11/EIA RS-422-A connection. The CCITT V.11/EIA RS-422-A signaling level interface is designed to function with the 3101, 3161, 3162, 3163, and 3164 ASCII/asynchronous displays. TP attachment via nonswitched or switched lines requires an asynchronous external modem with a CCITT V.24/EIA RS-232-C interface. Clocking is internal only.

Attachment of the ROLM terminals CYPRESS, CEDAR, JUNIPER, and ROLMPHONE 244PC is via the ROLM CBX II. The 3708 may be attached to one or more ROLM CBX II 8000 or 9000 systems. Connection of the 3708 to the ROLM CBX II is through a ROLM DataCom Module (DCM), a ROLM Data Terminal Interface (DTI), or an Integrated Personal Computer Interface (IPCI) card.

Security, Auditability and Control: The 3708 utilizes the security and auditability features of the host hardware and software.

User management is responsible for evaluation, selection, and implementation of security features, for administrative procedures, and for appropriate controls in application systems.

If sensitive data is sent over external communication facilities, user management may wish to pursue the application of cryptography.

Note: Cryptography must be performed external to the 3708.

HOST/TERMINAL ATTACHMENTS

The 3708 provides a total of ten ports for host and terminal attachment. For example, if one port is used for attachment to an SNA host, then nine ports are available for ASCII/asynchronous terminal or ASCII host attachment. If two ports are used for SNA host attachment and two ASCII hosts are attached, then six ports remain for ASCII/asynchronous terminal attachments.

Attachment to an SNA Host: Each ASCII/asynchronous device communicating with an IBM SNA host can operate in one of two modes:

Protocol conversion mode:

The 3708 is a protocol converter that allows ASCII/asynchronous devices, such as display terminals, printers, keyboard/printers, and personal computers to appear to an IBM SNA host as 3270 displays and printers. The 3708 converts the 3270 data stream to and from ASCII to permit ASCII devices access to 3270 applications programs on the host system. ASCII/asynchronous plotters can also be attached in this mode. The plotter appears the same to the host as a 3287 printer.

The 3708 in protocol conversion mode allows a display with an attached printer to share a 3708 port and appear to the host as two logical units. A user can communicate with the host processor from the display and have output sent to the printer over a single connection. This feature of the 3708 permits a remote user to realize a significant cost saving by having both display and printer capability on only one communication line.

Protocol enveloping mode:

The 3708 provides a protocol enveloping function, allowing TWX 33/35 compatible displays and keyboard/printers to communicate over an SNA/SDLC line attached to an IBM SNA host system through a 37X5 with NCP or a 3720 with NCP. The terminal's appearance to host applications is the same as a TWX 33/35 terminal connected through the Network Terminal Option (NTO) licensed program. For TWX compatible devices, the NTO function resides in the 3708 so that NTO does not need to be installed in the 37X5. Protocol enveloping mode can also be used to allow plotters and other ASCII/asynchronous devices to receive and transmit 8-bit transparent (256 character codes, or binary) data.

The 3708 can be attached to one or two IBM SNA host processors. Each connection is supported as a separate physical unit (PU). Dual connection means a device can selectively attach to one of two different IBM SNA hosts or select one of two links to the same IBM SNA host. Selection is made from the user's terminal at logon time. Eight ports are available for ASCII/asynchronous devices and ASCII host attachment when the 3708 is configured for two SNA/SDLC lines to IBM hosts.

The 3708 provides product specific alerts in Network Management Vector Transport (NMVT) format, and is supported by NetView. The 3708 also provides response time statistics similar to those provided by the 3274 when used in conjunction with NetView.

The 3708 can also use NPDA's V3R1/V3R2 non-product specific alert support facility. When the 3708 is connected to two IBM SNA hosts, it will send alerts to the host which owns the resource for which the alert is being sent. Alerts concerning resources not owned by either host will go to both hosts.

When an ASCII display and ASCII host are connected through the 3708 (operating in pass-through mode), central site problem determination will be enhanced because alerts for these resources will be sent to NetView or NPDA (to one or both IBM SNA hosts), even

though the resource does not belong to an SNA host. Alerts are also logged for display at the control terminal.

The 3708 will perform a Response Time Monitor (RTM) function similar to that of the 3274 interacting with the current release of NetView or NLDL V1R2/V1R3. RTM calculates the response time for each transaction and summarizes the result for each ASCII display being monitored. The 3708 will maintain five counters associated with each logical unit and track the number of transactions which fall in specified time ranges. The RTM function applies only to displays operating in protocol conversion mode. The control terminal will also be capable of displaying Response Time Monitor (RTM) counters.

Attachment to an ASCII Host Processor: The 3708 may be attached to one or more ASCII hosts. When connecting an ASCII/asynchronous display terminal to an ASCII host via the 3708, the 3708 is transparent to both the terminal and the host. This connection is called pass-through. The terminal user selects an ASCII host at logon time via a menu. If the ASCII host is available, connection will be established. Communication between the ASCII display and the ASCII host through the 3708 is always point-to-point. The line speeds and protocols of the ASCII display and the ASCII host must be the same. Only one ASCII display can communicate on the same link with an ASCII host at one time. Error checking is the responsibility of the ASCII host.

ASCII Display Support: ASCII/asynchronous devices may be attached directly up to 1,219m (4,000 ft) or remotely via switched or nonswitched lines.

Mode Selection: Via a menu at logon time, a user may select one of the following: One of two SNA/SDLC links to different IBM hosts, or one of two SNA/SDLC links to the same IBM host or one of multiple links to an ASCII host or hosts. A 3708 port can be pre-configured to allow an ASCII/asynchronous display to operate in protocol conversion mode, protocol enveloping mode, or be allowed to have the mode be dynamically selectable by the BIND from the IBM SNA host application.

Protocol Conversion Mode: In protocol conversion mode an ASCII display terminal operating in character mode attached to the 3708 is treated as one of the following IBM display units with a 1920 character screen (24 rows x 80 columns):

- 3278 model 2
- 3279 model 2A (in either monochrome or 4-color support)
- 3178 or
- 3179 (in either monochrome or 4-color support)

Note: For simplicity, all future references will state the 3178 as the emulated device.

The 3708 provides the necessary data stream conversion and translation from/to EBCDIC/ASCII that allows an ASCII display to emulate most of the full screen formatting and keyboard functions of a 3178 Display Unit.

The user identifies via a menu at logon time what kind of ASCII display to be used. The following ASCII displays have keyboard mappings pre-defined in the 3708:

- IBM 3101 models 10, 12, 13, 20, 22 and 23
- IBM PC in 3101 mode with 3101 standard keyboard functions
- IBM 3161 ASCII Display Station (in native mode)
- IBM 3162 ASCII Display Station
- IBM 3163 ASCII Display Station (supported as a 3161)
- IBM 3164 ASCII Display Station
- ROLM - CYPRESS, CEDAR and JUNIPER (via ROLM CBX II)
- DEC (Digital Equipment Corporation) VT52, VT100, and VT220
- Hewlett Packard 2621B
- Data General - D210
- Hazeltine model 1500, ESPRIT I and II
- TeleVideo 910 and 950
- Lear Siegler model ADM 3A
- BEEHIVE ATL-078
- ADDS - Viewpoint
- TELETYPE - models 5410 and 5420

NORTHERN TELECOM Displayphone

This list of displays contains several trademarks and registered trademarks. Viewpoint is a registered trademark of Applied Digital Data Systems, Inc. Dasher is a registered trademark of the Data General Corporation. DEC is a registered trademark of the Digital Equipment Corporation. ESPRIT I and ESPRIT II are trademarks of Esprit Systems, Inc. Dumb Terminal (Lear Siegler - model ADM 3A) is a registered trademark of Lear Siegler, Inc. BEEHIVE is a trademark of BEEHIVE International. Displayphone is a trademark of Northern Telecom, Inc. ROLM is a registered trademark and CYPRESS, CEDAR, and JUNIPER are trademarks of the ROLM Corporation. TeleVideo is a registered trademark of TeleVideo Systems, Inc.

Personal computers, operating in emulation mode as one of the above displays, can also attach provided an emulation program is available and compatible with one of the 3708's supported keyboard mappings.

In addition to the menu selectable display support listed above, other ASCII displays can be attached using the 3708 feature called "User-Defined Terminals" (UDTs). Up to six different tables supporting other ASCII display types not listed above can be configured by the control terminal operator to attach to a 3708. The UDTs can also be used to store redefinitions of the keyboard mappings for the menu selectable displays. The ASCII display to be attached as a "User-Defined Terminal" must be capable of operating in character mode, support the ANSI 3.4 - 128 character set and must be supported by one of the screen addressing classes as defined in the "3708 Network Conversion Unit Planning and Installation" manual.

The 3708 provides a standard EBCDIC/ASCII translate table as defined in ANSI 3.4 - 128 ASCII. One additional user defined translate table may be configured by the control terminal operator.

Highlighting and 4-color support in the 3270 data stream is supported if the ASCII device maps to the characteristics for color and highlighting as defined in the "3708 Network Conversion Unit Planning" manual. Light-pen application compatibility can be simulated using the Cursor Select key. Light-pens are not supported. The 3708 emulates the status line of the 3178 display. The status line is displayed on the 25th line if the ASCII display supports an addressable 25th line. Otherwise, the status line can be switched on/off by the user on the 24th line of the screen with a keystroke sequence.

Two features are provided on the 3708 to enhance productivity. They are type-ahead key queuing and enhanced null/blank processing. Type-ahead key queuing provides the user with the capability of entering keystroke sequences without waiting for a completion of a screen write. This is a very productive feature when an ASCII display or personal computer is attached through a low-speed switched connection. Enhanced null/blank processing allows the user to use either the space bar (blank characters) or the cursor move keys (nulls) to edit and separate fields. When the enter key is depressed the 3708 will convert imbedded nulls to blanks. Therefore, the data sent to the host contains blanks wherever there was either a blank or a null on the screen, and the format reflects the screen positioning of the data that the user saw displayed. Both of these functions are selectable by the user.

Protocol Enveloping Mode: In protocol enveloping mode, ASCII displays communicate as LU1, TWX 33/35 devices (NTO emulation). Communication is line-by-line. 8-bit transparent (256 character codes, or binary) data transfer is supported in this mode.

ASCII Keyboard/Printer Support:

- Protocol Conversion Mode:

In this mode, the keyboard/printer is supported as a printer only. The following keyboard/printer input functions are supported:

- Cancel Print, in LU1 SNA Character String (SCS) mode
- PA1 (Program Attention), in LU1 SCS mode
- PA2 in LU1 SCS mode
- Enable Print/Hold Print (LU1 SCS mode and LU3 Data Stream Compatibility (DSC) mode)

A single keyboard map will be supplied to support all keyboard/printers for the PA1, PA2, Hold Print/Enable Print and Cancel Print functions.

- **Protocol Enveloping Mode:**

In protocol enveloping mode, ASCII keyboard/printers communicate as LU1, TWX 33/35 devices (NTO emulation). Communication is line-by-line. 8-bit transparent (256 character codes, or binary) data transfer can be supported in this mode.

ASCII Printer Support:

IBM printers that the 3708 can be attached to include:

- 4201 ProPrinter II
- 4202 ProPrinter
- 4207 ProPrinter X24
- 4208 ProPrinter XL24

The printers listed above require Serial Attach Module #3000.

- **Protocol Conversion Mode:**

ASCII printers are supported as a 3287 model 1 or 2. Printers are supported as LU1 (SCS mode) and/or LU3 (DSC mode). Buffered and unbuffered printers are supported.

The following printer characteristics determine which ASCII printers can be supported by the 3708. If an ASCII printer has these characteristics, it is supported by the 3708:

- Asynchronous duplex communication
- Line speeds from 110 to 19.2K bps
- Serial interface CCITT V.24/EIA RS-232-C
- ANSI 3.4 - 128 ASCII character set (A user-defined translate table may be defined by the control terminal operator to translate other ASCII character sets.)
- Maximum line length of 255 characters
- Carriage return does not generate a line feed
- Line feed does not generate a carriage return
- Delete characters (X '7F') are ignored
- DC1/DC3 are used for XON/XOFF pacing
- 7-bit data with or without parity and 8-bit data without parity in LU1 SCS mode are supported.

- **Protocol conversion provides printer support in three modes:**

- **System mode:** In this mode, the printer is dedicated to output from the host. The host initiates any output to the printer.
- **Local mode:** In this mode, the printer is dedicated to local copy from one or more of the displays attached to other ports on the 3708. A local screen copy is initiated by a keystroke sequence or by the IBM SNA host.
- **Shared mode:** In this mode the printer may be used both for host-initiated printing and to allow attached displays to send data to the printer.

A printer can also be attached to an auxiliary port of a display, in which case the display and the printer will appear to the host as two different logical units. This printer may be used in system, local, and shared modes. This capability allows a display and a printer to share a single 3708 port, and is a very cost effective solution when the connection to the 3708 is via a switched line.

- **Protocol Enveloping Mode:**

A printer may be attached to a 3708 port in protocol enveloping mode if the port is configured to suppress the 3708's logon screen. Seven-bit (with or without parity) or 8-bit data can be received. Port configuration is accomplished through the 3708 control terminal.

ASCII/Asynchronous Plotter Support:

Plotters are supported in both protocol conversion and protocol enveloping mode and must have a serial interface CCITT V.24/EIA RS-232-C.

- **Protocol Conversion Mode:**

ASCII/asynchronous plotters are supported in LU1 SCS transparent mode. 7-bit (with or without parity) or 8-bit data transfer is supported in this mode.

- **Protocol Enveloping Mode:**

Plotters and other ASCII/asynchronous devices can be attached in this mode operating with compatible IBM SNA host application software. The 3708 device port(s) must be configured for 3708 logon screen suppression and transparent data flow. In this mode 8-bit data can be transmitted transparently through the 3708 to/from the IBM SNA host.

Personal Computer (PC) - File Transfer Support:

PC file transfer support is provided by the IBM PC/HOST File Transfer and Terminal Emulator Program (FTTERM) which supports IBM PCs communicating with an IBM SNA host through the 3708. It gives the PC user full-screen 3270 terminal emulation and file transfer capability when operating with the 3708 in protocol conversion mode. Connection between the PC and the 3708 is through the PC's asynchronous communication adapter.

FTTERM can also emulate a 3101 terminal and attach to the 3708 in protocol enveloping mode. This connection provides access to asynchronous applications at the IBM SNA host that formerly interfaced to the Network Terminal Option (NTO) in the 37X5 Communications Controller. The PC can also operate through the 3708 to an ASCII asynchronous host attached to another port of the 3708. In addition, FTTERM, operating in native mode, can access network services.

Control Terminal:

The control terminal provides the operator interface for managing the 3708, providing an easy-to-use means to configure the 3708, display product and operational information, and perform problem determination. The control terminal must initially be one of the IBM pre-defined ASCII displays. Once a User-Defined Terminal (UDT) is defined for a terminal for which IBM does not provide a mapping, then the terminal defined in the UDT can also serve as the control terminal. A password must always be entered before an operator can perform control terminal functions.

A control terminal can be used to configure the 3708. Configuration data is entered from the control terminal via user-friendly screens. The control terminal can be attached either directly or remotely on any downstream port capable of operating in protocol conversion mode. The remote connection can be either switched or non-switched. The 3708 configuration data can be displayed at any time by request from the control terminal operator.

The control terminal can be used to display vital product data, such as the repair ID number and EC level. It can also be used as a data and control lead monitor for a downstream port. This allows the control terminal to display data entering and leaving a particular downstream port. It can also be used to display the response time counters for each logical unit. The control terminal operator can use the 3708's local print capability to obtain a copy of the screens displaying the desired information.

The control terminal can also be used for problem determination. The seven most recent alerts will be logged by the 3708 and will contain a probable cause indication, the recommended action(s), and a failure code. The control terminal operator can perform problem determination by displaying these alerts and referring to the "Problem Determination" manual for detailed information about the alert and suggested corrective action. The control terminal functions can also be used by a remote IBM service specialist for microcode display, analysis, or alteration. This service is available to those customers having an IBM maintenance agreement on their 3708.

Pluggable Cartridge with Central Site Configuration:

The 3708 Pluggable Cartridge with Central Site Configuration enables the centralized management of 3708 configuration information and microcode changes. A data base for the storage of 3708 configurations, retrieval and loading of configuration information from/to IBM 3708s, and replication and modification of 3708 configuration information is supported.

Retrieval of configuration information from a 3708 is through a downstream port. Loading of new configuration information to a 3708 can be done through a downstream port or through the SNA host link using NetView or NCCF. Attachment to the downstream port may be switched or non-switched (leased line or direct attach).

Configuration information includes port, host and device definition. User-Defined Terminal (UDT) definition, and user-defined Translate Table definition.

Menu-driven, user-friendly screens with field-specific help facilities reduce the likelihood of errors during the configuration process. The 3708 central site configuration aid checks all configuration information as it is entered and warns the user of potential errors.

Microcode changes that have been applied to a 3708 may be retrieved via a downstream port and saved by the central site configuration aid. The microcode changes may then be distributed to other IBM 3708s in the network via a downstream port or sent to the SNA host system for downloading on the host link with NCCF or NetView.

The Pluggable Cartridge with Central Site Configuration includes all of the function of the Pluggable Cartridge.

MAINTENANCE

Maintenance Planning: The 3708 is designed to be supported from a control terminal and from an SNA host using the network management products NPDA and NLDM, as well as via the dial-in support offered through the IBM Remote Support Center. IBM remote service can be provided if the Remote Support Center is given access to the customer controlled password for the control terminal. In order for IBM to assist in problem isolation, the customer must provide the 3708 with access to the public switched network and furnish a (Canada only > 212A <) (Except Canada > V.22 <) compatible stand-alone asynchronous modem with auto-answer such as the IBM 5841. This assistance is available for 3708s covered under warranty or IBM maintenance agreements.

Maintenance Service: A brief summary of available service offerings for the 3708 is shown below:

Countries with Repair Center Capability

- **IBM On-Site Exchange (#9830):** IBM is responsible to deliver to the customer's site a functionally equivalent machine element in good working order and to replace the failing element with this exchange element. IBM will setup and test the exchange element and will remove the failing element from the customer's premises. Coverage will represent normal IBM shift coverage only, with additional coverage available as options to the basic coverage. This service allows the customer to call an IBM CE service number for assistance after the customer has attempted CPAR and is unsuccessful.
- **Customer On-Site Exchange (#9824):** IBM is responsible to deliver to the customer's site, a functionally equivalent machine element in good working order. The customer is responsible to disconnect the failing element, connect the exchange element and return the failing element to IBM, in accordance with IBM's instructions. IBM is responsible for both outbound and inbound shipping charges. This service allows the customer to call an IBM CE service number for assistance after the customer has attempted CPAR and is unsuccessful.
- **Customer Carry-In Exchange (#9816):** The customer is responsible to deliver the failing machine element to a designated IBM Service/Exchange Center. IBM will exchange a

functionally equivalent element in good working order for the failing element. The customer may instead package and ship, prepaid, the failing element to the designated IBM Service/Exchange Center. IBM will exchange and return ship the element, prepaid, to the originating customer location. This service allows the customer to call an IBM CE service number for assistance after the customer has attempted CPAR and is unsuccessful.

- **Customer Carry-In Repair (#9821):** The customer is responsible to deliver the failing machine element to a designated IBM Service/Exchange Center. IBM will repair the element and notify the customer as soon as it is ready for pick-up. The customer may instead package and ship, prepaid, the failing element to a designated IBM Service/Exchange Center. IBM will repair and return ship the element, prepaid, to the originating customer location. This service allows the customer to call an IBM CE Service number for assistance after the customer has attempted CPAR and is unsuccessful.
- **IBM Hourly Service:** IBM Hourly Service requires the same procedure be followed as the Customer Carry-In Repair offering. The customer is charged for repair labor, replacement of maintenance parts and all handling and shipping costs. Upon request, IBM will provide, for a charge, an estimate of repair charges. IBM Hourly Service does not provide Product Support Center access.

Countries without Repair Center Capability

- **IBM On-Site Repair (#9798):** IBM is responsible to come to the customer's site, repair and test the failing machine element. Coverage will represent normal IBM shift coverage only, with additional coverage available as options to the basic coverage.

Warranty: (Countries with repair center capability > The 3708 is covered under a one (1) year warranty. The specific service provided for this warranty is Customer On-Site Exchange. For an additional charge the warranty service can be upgraded to IBM On-Site Exchange Warranty Option. Optional periods of maintenance are available for the 3708. See "Service Plan" section for details. <)

(Countries without repair center capability > The 3708 is covered under a one (1) year warranty. The specific service provided for this warranty is IBM On-Site Repair coverage. <)

SPECIFY

- **Voltage:** (Canada only > 120V, 60 Hz, no specify code required. <) (Except Canada > No specify code required. High voltage and appropriate power cord will automatically default on the 3-digit country code.

Specify codes for low voltage machine may be entered. Appropriate power cords will be automatically shipped with low voltage machines.

#2804 - Low Voltage <)

- **Power Cable:** The power cables will be shipped with the appropriate country wall plug dependent upon the country code. No specify code is required for proper default cord. In countries where low voltage machines are specified, a 4.3m (14 ft) low voltage power cord is automatically shipped.
- **Power Cords:** The following power cord part numbers are for High Voltage machines in the countries shown:
 - 6952293: Argentina, Brazil
 - 1838577: Korea, Taiwan, Venezuela, Japan, Ecuador, Philippines
 - 6952313: Australia, New Zealand
 - 6952376: Chile
 - 6952358: Malaysia, Singapore
 - 6952349: Hong Kong
 - 6952322: Indonesia
 - 7842127: Mexico

The following power cord part number is for Low Voltage machines in all countries: 6952302.

- Nomenclature: The nomenclature codes will automatically default on the 3-digit country number. If other than standard is required then specify as follows:

#2935 - Canadian French

SPECIAL FEATURES (NONE)

ACCESSORIES

Accessories are ordered specifying the following part numbers. The 3708 has ten ports with CCITT V.24/RS-232-C 25-pin female connectors.

All external cables for the 3708 must be ordered separately and are chargeable items. Allow a lead time of at least two weeks for fixed length cables and four weeks for variable length cables.

Standard Length Cables: The following communication cables must be ordered by part number. CCITT V.24/RS-232-C cables can be ordered in three standard lengths. All cables are equipped with 25-pin connectors. DCE cables are equipped with male connectors on both ends. There are two types of DTE cables:

1. Three (M-to-F) cables, P/Ns - 6405393, 6405394, 6405395 are for direct attached devices that are equipped with a male connector.
2. Three (M-to-M) cables, P/Ns - 6405421, 6405422, 6405423 are for direct attached devices that are equipped with a female connector, such as the 3101, 3161, and 3163.

The upstream cable from the 3708 to the IBM host(s) should always be a DCE cable.

Standard length CCITT V.24/RS-232-C cables:

P/N	Description	Length
6405390	RS-232-C External cable - DCE	10 ft, 3m
6405391	RS-232-C External cable - DCE	25 ft, 8m
6405392	RS-232-C External cable - DCE	50 ft, 15m
6405393	RS-232-C External cable - DTE	10 ft, 3m
6405394	RS-232-C External cable - DTE	25 ft, 8m
6405395	RS-232-C External cable - DTE	50 ft, 15m
6405421	RS-232-C External cable - DTE	10 ft, 3m
6405422	RS-232-C External cable - DTE	25 ft, 8m
6405423	RS-232-C External cable - DTE	50 ft, 15m

Variable Length Cables: CCITT V.11/RS-422-A cables can be ordered in variable lengths up to 1,219m (4,000 ft). Cables are equipped with male to male connectors. Specify part number and length when ordering. Cables lengths greater than 122m (400 ft) are equipped with lightning-induced pulse protection circuitry.

Be sure the ASCII/asynchronous device is capable of supporting this interface.

- P/N 6405396 - Variable length external cable - up to 122m, (400 ft) maximum
- P/N 6405397 - Variable length external cable - from 123m to 1,219m, (401 ft to 4,000 ft) maximum

Procurement of equivalent cables through an alternate vendor is the customer's responsibility. Cables should be shielded. See the publication "IBM 3708 Network Conversion Unit Planning and Installation" (GA27-3766) for cable descriptions and specifications.

SUPPLIES (NONE WITH MACHINE)

3710 NETWORK CONTROLLER**PURPOSE**

The 3710 is an advanced network product which performs concurrent ASCII/asynchronous protocol conversion to full screen (1920 character) SNA 3270, BSC 3270 protocol conversion to SNA 3270, asynchronous and BSC RJE/MLI protocol enveloping, ASCII passthrough (to an ASCII host), and concentration of asynchronous, BSC, and SNA/SDLC traffic. 3710 data may be transmitted upstream to one or more MVS or MVS/XA host sites over one or more user defined SNA/SDLC and/or X.25 communication lines.

DESCRIPTION

The 3710 connects upstream to either a 3705, 3720, 3725, or another 3710, and downstream to both SNA and selected non-SNA devices. Attachment of up to 60 lines (upstream plus downstream) is provided. With relation to the 3710, upstream refers to the host side and downstream refers to the terminal side of the 3710.

The upstream attachment via a X.25 link is to a 3725 with NPSI only. The 3710 is supported by enhanced IBM communication network management (CNM) functions provided by NCCF, NPDA, ACF/NCP, ACF/VTAM and SSP on the IBM host(s).

Downstream SDLC devices are supported at speeds ranging from 110 bps to 64K bps. BSC and asynchronous devices are supported at speeds ranging from 110 bps to 19.2K bps. Upstream links can run at up to 64K bps.

The Configuration Control Program function within SSP is an IBM Program that provides user friendly configuration entry and validation services for the 3710. The Configuration Control Program component of SSP provides a database which can be used to manage a 3710 network effectively. Configuration parameters within any 3710 can be dynamically altered using the this component and NCCF. It supports all communication adapters on the 3710 except for the eight (8) Port Communication Adapter, which is supported by the control terminal only.

See the specific software sales manual pages for the 3710 support functions provided by the referenced software.

3710 configuration, installation, operation and problem determination can be accomplished through the use of a user provided control terminal. The control terminal must be an IBM 3101 or equivalent. It can be attached to the 3710 either directly or remotely via a switched or non-switched communication line. Use of the control terminal on a switched line allows a single control terminal to manage multiple 3710s.

The Control Terminal must be a TTY 33/35 terminal with the following characteristics.

- Supports half-duplex
- An 80 character X 25 lines display
- Alphanumeric keyboard
- Does not require echoplex.

Remote attachment of the Control Terminal is via a customer provided 1200-bits/second, auto-answer, half-duplex, 202C/CCITT V.24 compatible, standalone modem.

The 3710 has been designed for easy installation by untrained customer personnel. It is customer set up (CSU) equipment. The 3710 is provided with extensive internal diagnostics to support both CSU and customer problem analysis and repair (CPAR).

The 3710 is composed of a single machine type number and a single model. The model is composed of five machine elements. Five special features can be ordered with the base 3710-1.

Features for the 3710 can be ordered in quantities greater than could actually be installed in a machine at one time. This allows a customer to order spare elements in order to be able to bring up a failing unit as rapidly as possible. In the case of an element failure,

the customer would pull the failing element and substitute one of his working spares. All base elements and optional features are designed for easy plugability by the customer.

Orders will not be checked by AAS for features in excess of the maximum installable at one time.

The 3710 contains one of each of the following:

- Base Frame
- Diskette Unit (5 1/4 inch "Floppy")
- Control Unit including 384K of storage
- Power Unit
- Service Adapter(Dual Port EIA RS-232-C/CCITT V.24 Adapter)

MODELS

Model 1 001: 384K storage, dual port EIA RS-232-C/CCITT V.24 service adapter, 5 1/4 inch "floppy" diskette unit.

Prerequisites**Hardware**

The 3710 is designed to operate in a standard office environment, either directly or remotely attached to another 3710 or a 3705 or 3725 communications controller. The 3710 and its features are designed for customer setup. Microcode will be shipped on a diskette.

Configuration definition and validation support for the 3710 is provided through the Configuration Control Program on the host or through the control terminal. The 8PCA is managed only through the control terminal.

The customer is responsible for problem determination for the 3710. Customer Problem Analysis and Resolution (CPAR) should be executed by the customer. A customer provided control terminal is required in an IBM 3710 network for use by the customer in problem determination and configuration definition.

Software

The 3710 attaches to ACF/NCP V3 in a 3705, and to ACF/NCP V3 or V4 in a 3725 and to ACF/NCP V4 or ACF/NCP Subset in a 3720. The 3710 will communicate with ACF/VTAM V2 and V3 running under MVS/XA or MXS/370.

Other host subsystems and applications which support the 3710 are:

- NCCF - V2R1, V2R2
- NPDA - V3R1, V3R2
- NLDM - V1R2, V1R3
- NSI - R1
- ACF/SSP - V3 (5665-338 for MVS)

The 8PCA in protocol conversion mode appears as a 3274-51C/61C to IBM SNA host programs (e.g. IMS, CICS, TSO, and CMS) and 3274 application programs. The 8PCA also presents an NTO interface to an IBM SNA host and customer applications that previously required the NTO licensed program.

HIGHLIGHTS

- Remote Concentration

This capability provides for the concentration of data traffic from multiple communication lines and/or terminals onto one and/or multiple SDLC and/or X.25 links. Input traffic can be at different speeds and utilize selected forms of BSC and S/S protocols as well as SDLC. The 3710 upstream links can be attached either locally or remotely to a 3705, 3720 or 3725 port or to another 3710 port. Attachment to an upstream X.25 communication line is via a 3725 only. Only one level of 3710 to 3710 attachment is supported.

● Protocol Conversion

The 3710 supports protocol conversion of BSC 3270 data streams to SNA/SDLC 3270 appearance. The 8 Port Communication Adapter (PCA) feature of the 3710 converts data from ASCII/asynchronous devices to a full screen SNA/SDLC 3270 data stream, emulating a 3274-51C/61C control unit under configuration support A. This allows ASCII/asynchronous display, printers and keyboard/printers to appear as 327X/3287 (SNA) devices and to access SNA host application programs. ASCII/asynchronous protocol conversion support is only available to devices attached to an 8PCA, and not any other communication adapter on the 3710.

● Protocol Enveloping

The 3710 allows selected BSC and BSC/MLI traffic to be concentrated onto upstream SNA/SDLC or X.25 lines and transported across the network. 3780 BSC and JES BSC/RJE multileaving interface traffic is enveloped in the same fashion as would be done by a 3705, 3720 or 3725 running the remote half of NSI (TSF). Accordingly, while the host end of NSI(HSF) still must reside at the destination host, the 3710 provides the remote TSF function. The 3710 also allows the user to attach ASCII/asynchronous devices and concentrate their traffic onto a SNA/SDLC or X.25 line for communication with an IBM SNA host. The 3710's asynchronous enveloping function provides an interface to host applications similar to the Network Terminal Option (NTO) licensed program in a 3705, 3720 or 3725. TWX 33/35 compatible asynchronous devices attached to the 3710 can communicate with SNA applications without requiring that NTO be installed in the 3705, 3720 or 3725.

● ASCII Host Pass-through

The 8PCA feature provides the capability of attaching an ASCII/asynchronous host to the 8PCA. The host can communicate with an ASCII display on the same 8PCA in a transparent, or passthrough mode.

● Dynamic Network Change

The 3710 allows for the addition and deletion of 3710 downstream lines and devices via dynamic reconfiguration.

● Network Backup

The 3710 provides the capability to have multiple upstream links going to one or multiple 3705, 3720 or 3725 which go to one or multiple host domains. This capability allows the customer to provide network backup in case one of the upstream lines, modems, 3705s, 3720s or 3725s or hosts fails.

● X.25

X.25 support in the 3710 will be provided for host upstream links in addition to and/or in lieu of the SDC secondary function. Both Permanent Virtual and Switched Virtual Circuits are employed. The 3710 can not originate calls into the X.25 network. This support is available in conjunction with the 3720 or the 3725 only.

The X.25 feature for the 3710 will provide the capability to attach to data transmission services having interfaces complying with Recommendation X.25 (Geneva 1980) on the International Telegraph and Telephone Consultative Committee (CCITT). This interface support will be in conformance with the functional description contained in IBM's General Information Manual, GA27-3345, "The X.25 Interface for Attaching IBM SNA nodes to Packet-Switched Data Network".

At this time attachment to the following country networks may be announced if all the homologation/certification requirements have been completed.

- Argentina (ARPAC)
- Australia (AUSTPAC)
- Brazil (RENAPAC)
- Canada (DATAPAC)
- Korea (DACOM-NET)
- Mexico (TELEPAC)

- New Zealand (NZPO)
- Singapore (TELEPAC)
- Taiwan (PACNET)

Announcement and support of other X.25 networks will depend on network attachment availability and evaluation. Selection of X.25 networks for attachment will be based on IBM's technical and business judgment in addressing the requirements of customers. Consult your IBM representative for further information.

● Satellite Link Attachment

The 3710 will provide Modulo 128 support consistent with associated 3720 or 3725 support to provide the user with enhanced link utilization and end-user response time. Modulo 128 support for the 3710 is for SNA/SDLC both upstream and downstream of the 3710.

● Remote Assistance Support

Remote assistance is used by IBM support specialists to diagnose 3710 problems not resolved by the customer during the course of performing CPAR. This assistance is available to rental customers and those customers whose 3710s are under maintenance agreement or are still within warranty.

● Service Modem Attachment

Attachment of the service modem is to the public switched network ordered from the telephone company. The line should be ordered as a switched line for data communications.

● Equipment Description

The 3710 provides for up to a maximum of 60 ports. The maximum speed of a port can be up to 64K bps depending upon the type of communication adapter selected. The 3710 provides either internal or external clocking. The connecting lines can be either directly attached (no modems) or remotely attached via communication lines. Configuration, operation, and maintenance is performed by either a customer provided Control Terminal or associated host software, NCCF, SSP, and NPDA. (See respective software sales pages for specifics). The 3710 is a CSU (Customer Setup) and CPAR (Customer Problem Analysis and Resolution) machine. Off-line diagnostics require a Control Terminal.

● Attachment Support

The following upstream interfaces are supported by the 3710 employing SNA/SDLC and/or X.25 protocols.

- (Canada only) > EIA RS-232-C/CCITT V.24 - Local or Non-Switched to 19.2K bps
- CCITT V.35 - DDS - Local to 64K bps or Non-Switched to 56K bps
- CCITT X.21 - Local to 64K bps or Non-Switched to 48K bps <)
- (Except Canada) > EIA RS-232-C/CCITT V.24 - Local or Non-Switched to 19.2K bps.
- CCITT V.35 - DDS - Local or Non-Switched to 64K bps.
- CCITT X.21 - Local to 64K bps or Non-Switched to 48K bps (not Short Hold Mode). <)

The following downstream devices are supported by the 3710:

- Teletypewriter Exchange Service (TWX 33/35) terminals - Local, switched, or non-switched, point-to-point. The TWX 33/35 interface is as defined in the Bell System Technical Reference PUB #41713, dated August 1971, titled "Model 33,35 and 37 Stations for point-to-point Private Line Service".
- 3101 in TWX 33/35 compatibility mode - Local, switched, or non-switched, point-to-point.
- IBM Personal Computers in TWX 33/35 mode - Local, switched, or non-switched, point-to-point.
- 3780 BSC Protocol Interface or equivalent - Local, non-switched, switched, point to point. (User responsible for validating interface equivalency).

- BSC/RJE Multi-Leaving interface or equivalent - Local, non-switched, switched, point-to-point. (User responsible for validating interface equivalency).
- 3274 BSC - multipoint, Local or non-switched point to point with multipoint line control.
- 3276 BSC - multipoint, Local or non-switched point-to-point with multipoint line control.
- 3271 BSC - multipoint, Local or non-switched point-to-point with multipoint line control.
- SNA PU2 - non-switched, Local, point-to-point, including another 3710. Non-Switched, multipoint including another 3710.

● 8 Port Communication Adapter (8PCA)

The 8PCA provides a total of eight ports per feature for ASCII host and ASCII/asynchronous terminal attachment. For example, if one port is used for attachment to an ASCII host, then seven ports are available for ASCII/asynchronous terminal attachment. If two ports are used for ASCII host attachment, then six ports remain for ASCII/asynchronous terminal attachment.

Attachment to an IBM SNA Host

Each ASCII/asynchronous device communicating with an IBM SNA host through the 8 PCA can operate in one of two modes.

Protocol Conversion Mode

The 8PCA is a protocol converter that allows ASCII/asynchronous devices, such as display terminals, printers, keyboard/printers and personal computers to appear to an IBM SNA host as a 3270 display or printer. The 8 PCA converts the 3270 data stream to and from ASCII to permit ASCII devices access to 3270 application programs on the host system. ASCII/asynchronous plotters can also be attached in this mode. The plotter appears the same to the host as a 3287 printer.

The 8PCA in protocol conversion mode allows a display with an attached printer to share an 8PCA port and appear to the host as two logical units. A user may communicate with the host processor from the display and have output sent to the printer over a single connection. This feature of the 8PCA permits a remote user to realize a significant cost savings by having both display and printer capability on only one communication line.

Protocol Enveloping Mode

The 8PCA provides a protocol enveloping function, allowing TWX 33/35 compatible displays and keyboard/printers to communicate over an SNA/SDLC line attached to an IBM SNA Host system through a 37X5 with NCP. The terminal appears to the host application the same as would a TWX 33/35 terminal connected through the Network Terminal Option (NTO) licensed program. For TWX compatible devices, the NTO function resides in the 3710 so that NTO does not need to be installed in the 37X5. Protocol enveloping mode can also be used to allow plotters and other ASCII/asynchronous devices to receive and transmit 8-bit transparent (256 character codes, or binary) data.

The 3710 may be attached to up to five IBM SNA Host processors. Each 8PCA is supported as a separate physical unit (PU). This means that there is one NCP poll for all devices attached to a 8PCA. Multiple connection means that a device can selectively attach to one of five different IBM SNA hosts, or select one of multiple (up to five) links to the same IBM SNA Host. Selection is made from the user's terminal at log on time.

The 8PCA will use NPDA's V3R1/V3R2 non-product specific alerts support facility. Alerts from the 8PCA will appear in standard Management Vector Transport (NMVT) format. When the 8PCA is connected to more than one IBM SNA host, it will send alerts to the host which owns the resource for which the alert is being sent. Alerts concerning resources not owned by any IBM SNA host will go to all hosts.

When an ASCII device and ASCII host are connected through the 8PCA (operating in passthrough mode), central site problem determination will be enhanced because alerts for these resources will be sent to NPDA (to one or more IBM SNA Hosts), even though the

resource does not belong to an SNA host. Alerts are also logged for display at the control terminal.

The 8PCA will perform a Response Time Monitor (RTM) function similar to that of the 3274 interacting with the current release of NLDM V1R2/V1R3. RTM calculates the response time for each transmission and summarizes the result for each ASCII device being monitored. The 8PCA will maintain five counters associated with each logical unit and track the number of transactions which fall in specified time ranges. The RTM function applies only to displays operating in Protocol Conversion mode.

Attachment to an ASCII Host Processor

The 8PCA may be attached to one or more ASCII hosts. When connecting an asynchronous ASCII terminal to an ASCII host via the 8PCA, the 8PCA is transparent to both the terminal and the host. This connection is called passthrough. The terminal user selects an ASCII host at logon time via a menu. If the ASCII host is available, connection will be established. Communication between the ASCII display and the ASCII host through the 8PCA is always point-to-point. The line speeds and protocols of the ASCII display and the ASCII host must be the same, and the connection between the 8PCA and the ASCII Host must be direct or non-switched. Only one ASCII display can communicate on the same link with an ASCII host at one time. Error checking is the responsibility of the ASCII host.

ASCII Display Support

ASCII/asynchronous devices may be attached directly up to 1219m (4000 ft) or remotely via switched or non-switched lines.

Mode Selection

Via a menu at logon time, a user may select one of the following; one of up to five SNA/SDLC links to the same or different IBM SNA hosts, or one of multiple links to an ASCII host or hosts. An 8PCA port may be pre-configured to allow an ASCII/asynchronous display to operate in protocol conversion mode, protocol enveloping mode, or be allowed to have the mode be dynamically selectable by the BIND from the IBM SNA host application.

Protocol Conversion Mode

In protocol conversion mode an ASCII display terminal operating in character mode attached to the 8PCA is treated as one of the following IBM display units with a 1920 character screen (24 rows X 80 columns):

- 3278 Model 2
- 3279 Model 2A (in either monochrome or four color support)
- 3178
- 3179 (in either monochrome or four color support).

Note: For simplicity, all future references will state the 3178 as the emulated device. The 8PCA provides the necessary data stream conversion and translation from/to EBCDIC/ASCII that allows the user of an ASCII display most of the full screen formatting and keyboard functions of a 3178 display unit. Certain functions 3270 keys and functions are not supported. They are:

- ALT Cursor
- APL/TEXT
- ASCII option
- Attribute select keys
- Clicker on/off
- Compression of symbol definition bit strings
- Encrypt/decrypt
- Extended data streams
- Host load of printer authorization matrix
- IBM 3274 log/test facility
- Katakana
- Light-pen
- Magnetic readers
- Mono/dual case control of IBM 3278 Printer
- More than four-color support
- Programmed symbols
- Screen sizes larger than 1920 characters
- SFAP options

- Shift override of numeric lock
- SI print order
- Test request read
- User-defined alerts

The following specific ASCII displays are supported by the 8-Port Communication Adapter Feature for Protocol Conversion - switched or non-switched, point-to-point:

- 3101 Models 10, 12, 13, 20, 22 and 23
- 3161 ASCII Display Station (in native mode)
- 3163 ASCII Display Station (supported as a 3161)
- IBM PC in 3101 mode with 3101 standard keyboard functions
- ROLM - CYPRESS, CEDAR and JUNIPER (via ROLM CBX)

- ESPRIT I and ESPRIT II are trademarks of Esprit Systems, Inc.
- DUMB Terminal (Lear Siegler - model ADM 3A) is a registered trademark of Lear Siegler, Inc.
- DISPLAYPHONE is a trademark of Northern Telecom, Inc.
- ROLM is a registered trademark and Cypress, Cedar, and Juniper are trademarks of the ROLMM Corporation.
- TELEVIDEO is a registered trademark of Televideo Systems, Inc.
- BEEHIVE is a registered trademark of Beehive International.
- HEWLETT PACKARD is a registered trademark of Hewlett Packard.
- TELETYPE is a registered trademark of Teletype Corporation.

In addition to the supported displays listed above, other OEM ASCII displays may be attached using the 3710 8PCA feature called "User Defined Terminals" (UDTs). Up to 15 different tables that can support other OEM ASCII display types not listed above may be configured by the control terminal operator to attach to a 3710 8PCA at any one time. The ASCII display must be capable of operating in character mode and support the ANSI X3.4 1977 (ASCII) character set and must be supported by one of the four screen addressing classes as defined in the 3710 Planning Manual.

The 8PCA uses a standard EBCDIC/ASCII translate table as defined in ANSI 3.4, 1977 (ASCII). One additional user defined table may be configured by the control terminal operator.

Highlighting and four color support in the 3270 data stream is supported if the ASCII device supports these features. Light-Pen application compatibility may be simulated using the Cursor Select Key. Light-Pens are not supported. The 3710 8PCA emulates the status line of the 3278 display. The status line is displayed on the 25th line if the ASCII display supports an addressable 25th line. Otherwise, the status line can be switched on/off by the user on the 24th line of the screen with a keystroke sequence.

Any graphics display which can be supported for input as one of the IBM or user defined ASCII/asynchronous displays can receive 8-bit transparent (binary) data from the host in protocol conversion mode.

Two features are provided in the 8PCA to enhance productivity. They are type-ahead key queuing and enhanced null/blank processing. Type-ahead key queuing provides the user with the capability of entering keystroke sequences without waiting for a completion of a screen write. This is a very productive feature when

an ASCII display or personal computer is attached through a low speed switched connection. Enhanced null/blank processing allows the user to use either the space bar (blank character) or the cursor move keys (null) to edit and separate fields. When the enter key is depressed the 8PCA will convert imbedded nulls to blanks. Therefore, the data sent to the host contains blanks wherever there was either a blank or null on the screen, and the format reflects the screen positioning of the data that the user saw displayed. Both of these functions are selectable by the control terminal operator.

Protocol Enveloping Mode

In protocol enveloping mode, ASCII displays communicate as LU1, TWX 33/35 devices (NTO emulation). Communication is line by line. 8-bit transparent (256 character codes, or binary) data transfer is supported in this mode.

ASCII Keyboard/Printer Support

Protocol Conversion Mode

In this mode, the keyboard/printer is supported as a printer only. The following keyboard/printer input functions are supported:

- Cancel Print, in LU1 SNA Character String (SCS) mode
- PA1 (Program Attention), in LU1 SCS mode
- PA2 in LU1 SCS mode
- Enable Print/Hold Print (LU1 SCS mode and LU3 Data Stream Capability - DSC - mode).

A single keyboard map will be generic for all keyboard/printers for the PA1, PA2, Hold Print/Enable Print, and Cancel Print functions.

Protocol Enveloping Mode

In protocol enveloping mode, ASCII keyboard/printers communicate as LU1, TWX 33/35 devices (NTO emulation). Communication is line by line. 8-bit (256 character codes, or binary) data transfer can be supported in this mode.

ASCII Printer Support

Protocol Conversion Mode

ASCII printers are supported as a 3287 Model 1 or 2. Printers are supported as LU1 (SCS mode) and/or LU3 (DSC mode). Buffered and un-buffered printers are supported.

The following printer characteristics determine which ASCII printers may be supported by the 8PCA. If an ASCII printer has these characteristics it is supported by the 8PCA.

- Asynchronous duplex communication
- Line speeds 110 to 19.2K bps
- Serial interface CCITT V.24
- ANSI X3.4, 1977 (ASCII) character set
- Maximum line length of 132 characters
- Carriage return does not generate a line-feed
- Line-feed does not generate a carriage return
- Delete characters (X '7F') are ignored
- DC1/DC3 are used for XON/XOFF pacing
- Uses 7-bit data with or without parity and 8-bit data without parity in LU1 SCS mode.

Protocol conversion provides printer support in three modes:

- System mode: In this mode, the printer is dedicated to output from the host. The host initiates any output to the printer.
- Local mode: In this mode, the printer is dedicated to local copy from one or more displays attached to other ports on the 8PCA. A local screen copy is initiated by a keystroke sequence or by the IBM SNA host.
- Shared mode: In this mode the printer may be used both for host initiated printing and to allow attached displays to send data to the printer.

A printer can also be attached to an auxiliary port of a display in which case the display will appear to the host as two different logical units. This printer may be used in system, local, and shared modes. This capability allows a display and a printer to share a

single 8PCA port, and is a very cost effective solution when the connection to the 8PCA is via a switched line.

Protocol Enveloping Mode

A printer may be attached to an 8PCA port in protocol enveloping mode if the port is configured to suppress logon screens. 7-bit (with or without parity) or 8-bit data can be received. Port configuration is accomplished through the 3710 control terminal.

ASCII/Asynchronous Plotter Support

Plotters are supported in both protocol conversion and protocol enveloping modes and must have a serial interface CCITT V.24.

Protocol Conversion Mode

ASCII/asynchronous plotters are supported in protocol conversion mode as a 3287 printer. 7-bit (with or without parity) or 8-bit data transfer in LU1 SCS transparent mode is supported.

Protocol Enveloping Mode

Plotters and other ASCII/asynchronous devices can attach in this mode operating with compatible IBM SNA host application software. The 8PCA device port(s) must be configured for logon screen suppression and transparent data flow. In this mode 8-bit data can be transmitted transparently through the 8PCA and the 3710 to/from the IBM SNA host.

Personal Computer (PC) - File Transfer Support

PC file transfer support is the means by which data can be transferred between the disk/diskette on a PC attached to the 8PCA and either an IBM or an ASCII host. This file transfer support is in the form of complementary programs, one in the host and one in the PC, which provide file transfer support in the specific hardware and software environment.

A customer wishing to carry out PC file transfer through the 8PCA must write or acquire a pair of programs for the host and the PC which can provide the required functions in his environment. The 3710 Planning Manual provides the information which the customer will need in implementing PC file transfer through the 8PCA. File transfer may be implemented in all modes of 8PCA operation - protocol conversion, protocol enveloping, and ASCII/asynchronous passthrough.

Control Terminal

The Control terminal provides the operator interface for managing the 8PCA, providing an easy-to-use means to configure the 8PCA ports, display products, and operational information, and perform problem determination. The control for the 8PCA must meet the same requirements as the 3710 control terminal. A password must always be entered before an operator can perform control terminal functions.

The control terminal is used to configure the 8PCA(s). Configuration data is entered from the control terminal via user friendly screens. The control terminal may be attached either directly or remotely on any of the 3710's ports except for the 8PCA ports. The remote connection may be either switched or non-switched. The 8PCA configuration data can be displayed at any time by request from the control terminal operator.

The control terminal can be used to display vital product data, such as the repair ID number and EC level. It can also be used as a data and control lead monitor for a downstream port. This allows the control terminal to display data entering and leaving a particular downstream port. It can also be used to display response time counters for each logical unit. The control terminal operator may use the 8PCA's local print capability to obtain a copy of the screens displaying the desired information.

The control terminal may also be used for problem determination. The twelve most recent alerts will be logged by the 3710 and will contain a probable cause indication, the recommended action(s), and a failure code. The control terminal operator may perform problem determination by displaying these alerts and referring to

the Control Terminal Guide for detailed information about the alert and suggested corrective action. The control terminal functions may also be used by a remote IBM service specialist for microcode display, analysis, or alteration. This service is available to those customers having an IBM maintenance agreement on their 3710.

Security

User access to the 8PCA can be controlled by requiring users to enter a password in order to gain access to a port. Passwords are assigned from the control terminal, and can be different for each port. The 8PCA can optionally be configured without port passwords so that IBM host application passwords are all that is necessary to logon.

SNA session security is supported. When a ASCII device is in session with an IBM SNA host and either disconnects or exceeds the configurable inactivity timer the 3710 will terminate the session. Another device is NOT allowed to dial into a port and gain access to a SNA session which was previously defined, but not yet terminated. Session disconnect from the IBM SNA host is also supported. If the IBM SNA host subsystem or application supports the NOTIFY command, the 8PCA provides power on/off notify whenever the terminal connects/disconnects or is timed out by the 8PCA due to inactivity.

The 8PCA cannot provide security for host subsystems or applications (such as IMS) which retain data when the session is terminated (i.e., by anything other than an application or user logoff) in the expectation that when the same logical unit comes into session again, it will be the same terminal and user. For example, IMS maintains the conversation even though the session with a workstation was terminated. Subsequent access to the same port of the 8PCA by a different workstation would allow a new user access to the data queue established during the previous session.

Operating Environment

The 3710 is fully compatible with SNA. The 3710 allows attachment of non-SNA devices to a SNA network and takes advantage of SNA CNM functions.

Device Attachment

The display terminals mentioned in this document are products of the following companies that have been tested at the level defined by the following documentation:

- "IBM 3101 Display Terminal Description", GA18-2033-1, dated May 1980 (Second edition).
- "IBM Personal Computer, IBM 3101 Emulation Program", 6936712, dated November 1982 (first edition) and "IBM Technical Reference - Personal Computer XT", 1502237, dated April 1983 (Revised Edition).
- "IBM 3161, 3163 ASCII Display Stations".
- "Lear Siegler ADM 3A - ADM 3A Dumb Terminal Video Display Unit User's Reference Manual", by Lear Siegler, Inc. (document #DP2190683F), dated June 1983 edition.

- "Data General D210 - Dasher D210/211 Display Terminal User's Manual", by Data General Corporation, (document #014-000746-01), Revision 1, dated February 1984.

Attachment Interfaces

IBM SNA Host Attachment

The IBM systems to which the 3710 can attach include the 3090, 308X, 303X, 4341, and 4381 operating with a 3705, 3720 or 3725 Communication Controller. The 3710 can also attach to another 3710 Network Controller.

The 3710 can be attached to the IBM host either directly or remotely via a nonswitched communication link. Communication (bisynchronous at 19.2K bps) is half-duplex on either half duplex or duplex communication facilities. Communication (SDLC adapter at 64K bps or Start/Stop at up to 19.2K bps) can be either half- or full-duplex. Connection is via V.35, X.21 or X.25, or V.24.

Data rates up to 64K bps concurrently on each upstream link to the IBM SNA host(s) are supported where facilities and support are available. NRZI and NRZ are supported. See the M2700 sales pages for supported facilities.

3710 Network Controller

The 8PCA may be attached to a 5841 modem, which may be used on the asynchronous links at speeds up to 1200 bps. The IBM 1200 bps internal modem may be used with the IBM Personal Computers attached to a 8PCA. All of these modems are attached via the CCITT V.24 interface.

ASCII Host Attachment

The 8PCA can be attached to one or more ASCII hosts. Attachment can be direct connection or via a non-switched point-to-point communication link. Data rates of up to 19.2K bps are supported. Connection is via CCITT V.24 interface. CCITT V.11 is not supported.

Duplex communication facilities are required. Clocking is internal only.

ASCII/Asynchronous Device Attachment

Attachment characteristics of ASCII/asynchronous devices may be either direct or point-to-point non-switched or switched. Auto answer/auto disconnect are supported. Data rates from 110 to 19.2K bps are supported. Auto-baud recognition (auto-baud/auto-parity) is provided for devices on switched lines at speeds up to and including 4.8K bps. Interface supported are:

CCITT V.24 up to 15m or V.11 signalling levels up to 1219m. The CCITT V.11 signalling level is designed to operate with the 3101, 3161 and 3163 ASCII/asynchronous displays. TP attachment is via non-switched or switched lines requires an asynchronous external modem with CCITT V.24 interface. Clocking is internal only.

Modem Attachment

The 8PCA can attach to an external IBM modem or PTT mandatory modem supplied with CCITT recommendation V.24, V.28, ISO standard 2110 and other relevant CCITT recommendations. Attachment of non-IBM modems of other DCEs is subject to provisions of the "Multiple Supplier System Bulletin."

Attachment of the ROLM terminals, CYPRESS, CEDAR, and JUNIPER is via the ROLM CBX II. Connection of the 8PCA to the ROLM CBX II is through a ROLM DATACOM module (DCM) or through a ROLM Data Terminal Interface (DTI).

The 8PCA plugs into the 3710 using two-line adapter slots.

Planning Information

Installation and Configuration Support

The 3710 and the 8PCA are designed to be set up by the customer. During the Customer Setup (CSU) process the customer verifies, using the internal diagnostics, that the 8PCA hardware is operational. The customer must then configure the 8PCA to allow host/device attachment. The control terminal operator, using the completed configuration forms, enters the configuration data into the 3710. The configuration data reside on the diskette storage in the 3710 and are retained should a power failure occur. The 3710 comes pre-configured to allow the control terminal access.

Maintenance Planning

The 8PCA is designed to be supported from a control terminal and from an SNA host using the network management products NPDA and NLDM, as well as via dial-in remote service. Remote service can be provided during the times that IBM is given access to the customer controlled password. In order for IBM to assist in problem isolation, the customer must provide his 3710 service adapter with dial access to the public switched network. This assistance is available for 3710s covered under warranty of IBM maintenance agreements, and for rental 3710s. Refer to Charges, Terms and Conditions for details.

Customer Responsibilities: Each customer should order the updated "3710 Network Controller Introduction", GA27-3430, and the updated "3710 Network Controller Planning Manual", GA27-3431-0 unless already acquired for set-up and planning work. These manuals will be updated for the 8PCA prior to General Availability of the 8PCA.

The customer is responsible for:

Do not reproduce without written permission

MACHINES

- Adequate site preparation
- Procurement of all communication cables for IBM host, ASCII host and ASCII/asynchronous device attachment.
- Receipt at customer's receiving dock, unpacking and placement of unit
- Setup of unit, connection of cables to communications lines, modems and processors
- Setup of the modems and attached devices
- Configuring and initialization of the 3710 8PCA
- Procurement of cables for non-IBM products
- Verifying that any OEM equipment operating with the 3710 8PCA meets customer criteria
- Price quotations, installation and cost of common carrier equipment and service
- Determining the required number of spares
- Ordering and installing a public switched network circuit for attachment to the service adapter for Warranty/Maintenance Agreement.
- If a customer has obtained a 3710 prior to General Availability of the 8PCA, a notice describing the microcode diskette EC update supporting the 8PCA will be sent to the customer, requiring his response to obtain this EC.
- Performing Customer Problem Analysis and Resolution.

Customer must provide a 1200 bps, auto-answer, half-duplex, 202-C/CCITT V.24 compatible, standalone modem for remote IBM assistance.

A Control Terminal is required for IBM On-Site Repair.

Spares: The customer should evaluate the number of spare components which may be required to meet the operational requirements of each customer site. The number of spare (8PCAs) for the 3710, as well as spare DCEs for the attached circuits will be dependent upon the number of units per site the customer has installed, the operational requirements, physical locations and layouts. In addition, the customer should consider such items as response time-of-service personnel (user or IBM), proximity to support organizations and the possibility that any impact on the upstream components will affect all downstream users equally. In all cases, the customer should test spares for correct operation before placing them on the shelf.

See M2700 sales pages for communications facilities. See "IBM Network Controller Planning", GA27-3431-0, for complete customer responsibilities.

Performance Considerations

The 3710 is supported under HONE. HONE provides a Performance Analyzer which allows the user to estimate response time, line utilization, 3710 processor utilization and to determine the amount of storage required by the 3710. The HONE Configurator/Analysis number is CF3710. Additionally a manual performance analyzer is provided in the "3710 Planning Guide", GA27-3431. CF3710 will be updated to support the 8PCA Fourth Quarter, 1985. An update to the 3710 Planning Guide will be available four weeks prior to General Availability.

Warranty: (Countries with repair center capability) The 3710 is covered under a one (1) year warranty. The specific service provided for this warranty is Customer On-Site Exchange. For an additional charge the warranty service can be upgraded to IBM On-Site Exchange Warranty Option. Optional periods of maintenance are available for the 3710. See service plan section for details. <)

(Countries without repair center capability) The 3710 is covered under a one (1) year warranty. The specific service provided for this warranty is Customer On-Site Exchange. For an additional charge

the warranty service can be upgraded to Extended Shift Coverage. See service plan section for details. <)

Security, Auditability, and Control: The 3710 utilizes the security and auditability features of the host hardware and software. User management is responsible for evaluation, selection and implementation of these features, for administrative procedures, and for appropriate controls in application systems.

If sensitive data is sent over external communication facilities, user management may wish to pursue the application of cryptography.

Note: Cryptography must be performed external to the 3710.

Maintenance Service: A brief summary of available service offerings for the 3710 is shown below.

(Countries with repair center capability) > IBM On-Site Exchange

IBM is responsible to deliver to the customer's site a functionally equivalent machine element in good working order and to replace the failing element with this exchange element. IBM will set up and test the exchange element and will remove the failing element from the customer's premises. Coverage will represent normal IBM shift coverage only, with additional coverage available as options to the basic coverage. This service allows the customer to call IBM Customer Engineering for assistance after the customer has attempted CPAR and is unsuccessful.

Customer On-Site Exchange

IBM is responsible to deliver to the customer's site, a functionally equivalent machine element in good working order. The customer is responsible to disconnect the failing element, connect the exchange element and return the failing element to IBM, in accordance with IBM's instructions. IBM is responsible for both outbound and inbound shipping charges. This service allows the customer to call IBM Customer Engineering for assistance after the customer has attempted CPAR and is unsuccessful.

Customer Carry-In Exchange

The customer is responsible to deliver the failing machine element to a designated IBM Service/Exchange Center. IBM will exchange functionally equivalent element in good working order for the failing element. The customer may instead package and ship, prepaid, the failing element to a designated IBM Service/Exchange Center. IBM will repair an return ship the element, prepaid, to the originating customer location. The service allows the customer to call IBM Customer Engineering for assistance after the customer has attempted CPAR and is unsuccessful.

Customer Carry-In Repair

The customer is responsible to deliver the failing machine element to a designated IBM Service/Exchange Center. IBM will repair the unit and notify the customer as soon as it is ready for pick-up. The customer may instead package and ship, prepaid, the failing element to the designated IBM Service/Exchange Center. IBM will repair and return ship the unit, prepaid, to the originating customer's location. This service allows the customer to call IBM Customer Engineering for assistance after the customer has attempted CPAR and is unsuccessful.

IBM Hourly Service

IBM Hourly Service requires the same procedure to be followed as the repair offering, Customer Carry-In Repair. The customer is charged for repair labor, replacement parts and all handling and shipping costs. Upon request, IBM will provide, for a minimum charge, an estimate of repair charges. IBM Hourly Service does not provide Product Support Center access. <)

(Countries without repair center capability) > IBM On-Site Repair (#9798)

IBM is responsible to come to the customer's site, repair and test the failing machine element. Coverage will represent normal IBM shift coverage only, with additional coverage available as options to the basic coverage. <)

Remote Assistance

Remote assistance is used by IBM support specialists at the Product Support Center to diagnose 3710 problems not resolved by the customer.

All of the above options except IBM Hourly Service requires access to the 3710 via a customer-provided Control Terminal and auto-answer modem.

Publications: Following is a list of the publications available at announcement for the 3710. These documents will be updated to reflect the new 8PCA and the updated version will be available four weeks prior to the 8PCA General Availability.

- IBM 3710 Network Controller Introduction #GA27-3430
- IBM 3710 Network Controller Planning #GA27-3431

Following is a list of the publications available at shipment for the 3710. These documents will be updated to reflect the new 8PCA and the updated versions will be available at the time of shipment of the 8PCA.

- IBM 3710 Network Controller Operator's Guide
- IBM 3710 Network Controller Customer Setup and Relocation
- IBM 3710 Network Controller Problem Report
- IBM 3710 Network Controller Control Terminal Guide
- IBM 3710 Network Controller Repair Center and Maintenance Guide
- IBM 3710 Network Controller Parts Catalog
- IBM 3710 Network Controller Configuration Manual

SPECIFY

- (Canada only) > Voltage (120V, 60 Hz): No specify code required. <
- (Except Canada) > No specify code required. High voltage and appropriate power cord will automatically default on the three digit country code. Specify codes for low voltage machine may be entered. Appropriate power cords will be automatically ship with low voltage machines. #2804 - Low Voltage. <

The power cables for EMEA and AG-APG will be shipped with the appropriate country wall plug dependent upon the country code. No specify code is required for proper default cord. In countries where low voltage machines are specified, a 4.3m low voltage power cord is automatically shipped.

Nomenclature: The nomenclature codes will automatically default on the 3 digit country number. If other than standard is required then specify as follows:

- Canada #2935 for Canadian French

SPECIAL FEATURES

Dual EIA RS-232-C/V.24 Communication Adapter (#7001): Provides for attachment of up to two RS-232-C/V.24 communications lines. Setup by customer. See specify features for communication cables attaching to this feature. Devices attaching to this feature must be the same link level protocol.

V.35 Communication Adapter (#7005): Provides for attachment of one V.35 communication line. Setup by customer. See specify features for communication cables attaching to this feature.

X.21 Communication Adapter (#7010): Provides for attachment of one leased X.21 communications line. Setup by customer. See specify features for communication cables attaching to this feature.

Eight-Port Communication Adapter (#7015): Provides for attachment of up to eight RS-232-C/V.24 DCEs controlling communication lines or eight RS-232-C/V.24 DTEs, or eight RS-422-A/V.11 (displays only) DTEs, or a combination of the above, setup by customer. Attachment cables must be ordered separately. A maximum of eight cables may be connected to this feature. Lines/devices attaching to this feature must be asynchronous protocol.

128K Storage Expansion Feature (#7020): Provides additional 128K bytes of storage to the base 384K bytes. Maximum: One. Customer Setup: Yes.

Up to 99 communication adapter features, #7001, #7005, #7010, and #7015 can be ordered for the 3710. They can be all one feature number or a mix of all four feature numbers but cannot exceed a total of 99. Orders will not be checked by AAS for features in excess of the maximum which can physically fit into the 3710 at one time.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Communication Cables

The following communication cables must be ordered by part number via MS ORDER through AAS. They are separately charged to the customer. For prices, find the part numbers under the ACCESSORIES section of HONE.

In this table, "DCE" refers to Data Circuit-terminating Equipment (modems etc. used to connect to communication lines), and "DTE" is Data Terminal Equipment (devices that are directly connected to the 3710 (e.g. 3101, 3161, IBM PC, 3274, ...)).

Part Number	Description/Length	Attaches to Feature #
6319101	EIA/DCE (stub) - 0.6 m	7001 (note 1)
6319127	EIA/DCE - 2.5 m	7001
6319102	EIA/DCE - 6.0 m	7001
6319104	EIA/DCE - 15.0 m	7001
6319128	EIA/DTE - 2.5 m*	7001
6319098	EIA/DTE - 6.0 m*	7001
6319100	EIA/DTE - 14.6 m*	7001
6319129	V.35/DCE- 2.5 m	7005

Notes:

1. This stub can be connected into cables 6319128, 6319098, or 6319100 to provide attachment to another 3710.

MACHINES

2. With this adapter cable, current two-port EIA cables can be used with the 8PCA.
3. Variable length cable, specify length when ordering.
 - * This cable is for direct attachment to a terminal.
 - ** 7015 refers to the 8 Port Communication Adapter.
 - *** This cable provides for a female connector, which can be plugged into an interchange cable prior to attachment to a terminal.

Ordering Spare Machine Elements

Service Modem	#6340825
Power Unit	#4718250
Diskette Unit	#4718240
Control Unit	#4718252

Machine elements may be ordered in any quantity to provide spare elements as required by the customer. For shipment, specify machine element (B/M) number at time of order entry. Order at any other time by part number.

Warranty/Maintenance for Spare Elements: Spare elements are covered under a one (1) year warranty. The specific service offering for this warranty is Customer On-Site Exchange. The proof-of-purchase is necessary to determine the period of warranty coverage on the elements. Maintenance for spare machine elements, after the warranty period, is available on an IBM Hourly Service basis at an IBM Repair Center. A minimum charge is applied.

CUSTOMER REPLACEMENT PARTS

- 4765515 - Storage Cartridge Blank
- 4765546 - Key for insertion and removal of machine elements.

4765589 - Communication Adapter Blank for unused adapter positions.

4765597 - X.21 Wrap Plug

6319145 - 8PCA Wrap Plug, RS-232-C

6319146 - 8PCA Wrap Plug, RS-422-A

6340847 - Red Indicator lamp for front operator panel.

6340848 - Green Indicator lamp for front operator

6835348 - V.35 Wrap Plug, V.35 to DCE

6835349 - V.35 Wrap Plug, V.35 to DTE panel.

5214456 - 230V main line fuse.

The following power cord part numbers are for High Voltage machines:

P/N	Countries
2684644	Chile
5640664	Australia, New Zealand
5641083	Japan
5688133	Argentina, Brazil, Korea, Taiwan, Venezuela
6841461	Peru

The following power cord part number is for Low Voltage machines: 8592302.

MACHINES

M 3715.1
Feb 84

3715 PRINTER

[NO LONGER AVAILABLE]
(Effective March 20, 1984)

PURPOSE

The 3715 is a printer for all models of the 3741.

MODELS

- Model 1** 001 40 cps printing rate in both directions
Model 2 002 80 cps printing rate in both directions

Prerequisites: #8111 and #8120 or #8121 on the 3741.

HIGHLIGHTS

The 3715 prints serially in both left-to-right and right-to-left directions using the EBCDIC character set. The maximum print line is 132 print positions at 10 characters per inch spacing. Line spacing is six lines per inch.

Reformatting, editing, disk read, line feed, and printed line length are factors which affect printer throughput. For detail calculation of performance, refer to *3741 Reference Manual* (GA21-9183). In most cases, throughput can be summarized as follows: the 3715 mdl 1 is equal to or faster than the 3713 Printer, and the 3715 mdl 2 is approximately 50 percent faster than the 3715 mdl 1.

When using the 3741 mdls 3 or 4 ACL Translator (#1350), the 3715 mdl 2 is recommended in order to obtain equal or greater throughput than the 3713.

The unit has a pressure-feed platen that permits feeding of forms in a range of 3 to 14-7/8 inches overall width. 15-inch forms can also be accommodated. Continuous forms fold-to-fold length may range from 3 to 14 inches. Edge-punched continuous forms are fed using the adjustable forms tractor, which is standard.

Matrix characters are formed by seven vertical wires printing dots in up to four of seven possible horizontal positions. Refer to *Form-Design Printers Reference Guide* (GA24-3488) for design considerations and limitations. Up to 6-part forms can be printed with a maximum thickness of .018 inches. 5- and 6-part forms should be tried for satisfactory feeding, print registration, and print quality. Card stock continuous forms are not recommended. For optimum handling of continuous forms, the Forms Stand (#4450) is recommended.

Publications: *IBM Data Station Operator Guide* (GA21-9131) and *IBM 3741 Data Station Reference Manual* (GA21-9183).

SPECIFY

- Power: Power is supplied to the 3715 by the attaching 3741, no specify required.
- Color: Specify #9041 for red, #9042 for yellow, #9043 for blue, or #9045 for gray.
- Printer Language Group: Printer graphics are consistent with keyboard arrangement of attaching 3741. If 3715 is ordered for field installation on previously installed 3741, keyboard arrangement feature code of 3741 must be respecified.

(Japan only→

To print Katakana language, specify Katakana keyboard arrangement (#2973) on 3741 order. If 3715 is ordered for field installation on previously installed 3741, keyboard arrangement feature code of 3741 must be respecified. ←)

- Machine Nomenclature:

English	#2927	Italian	#2932
French	#2928	Japanese	#2930
German	#2929	Spanish	#2931

SPECIAL FEATURES (None)

MODEL CONVERSIONS

Model conversions are field installable.

ACCESSORIES

Forms Stand (#4450): Permits feeding of continuous forms from the carton and provides for forms stacking after printing. This accessory is a one-shelf forms stand. For field installation, order by feature number on MES.

SUPPLIES

Ribbons: A black ribbon, P/N 1136653 or equivalent, is required.

3720 COMMUNICATION CONTROLLER

PURPOSE

The 3720 controls data communications between modem attached, directly attached (without a modem) or IBM Token-Ring Network attached terminal devices and one or more directly or remotely connected IBM 4341, 4361, 4381, 303X, 308X 3090, or 937X host processors, or between two host processors. Remote connection may be via PTT provided or customer owned communication facilities.

The 3720 is the base machine. An optional 3721 Expansion Unit provides additional line attachment capability.

MODELS

Model 1 001: Channel attached Communication Controller with line attachment capability.

Model 2 002: Link attached Communication Controller with line attachment capability.

Model 11 011: Channel attached Communication Controller with line and IBM Token-Ring Network attachment capability.

Model 12 012: Link attached Communication Controller with line and IBM Token-Ring Network attachment capability.

Customer Setup (CSU): The 3720 Mdl 2 and 12 are designated Customer Setup thereby offering the customer early availability and relocation flexibility.

Prerequisites: A user provided control terminal is required as operator console. (Except Brazil> This terminal may be directly attached (local) or attached via a modem and a switched telephone line (remote). When it is remote, a 1200 bps, duplex modem compatible with the CCITT Recommendations V.22 (Alternative B), <) (Except Brazil> or V.22bis, <) (Except Brazil> operating in asynchronous mode with auto-answer, is required. <)

(Brazil only> A directly attached 3727 console is required. <)

A customer provided modem compatible with CCITT Recommendation (Except Canada> V.23 <) (Canada only> V.22 <) operating in synchronous mode with autoanswer at 1200 bps over the public switched telephone network is required to attach to the RSF port. This modem has to be compatible with the modems installed at the supporting RSF site.

Should a customer elect not to accept RSF support, then a local console is required.

If channel-attached, the 3720 requires a control unit position on a system channel. See processor sales manual pages for details.

When attaching to a 43XX in EP mode, restrictions are imposed on the number of available subchannels which may be used by the 3720. On the 9370 processors, EP and PEP modes are not supported.

HIGHLIGHTS

Characteristics of the 3720 Communication Controller:

- The 3720 is an entry member of the IBM 3725 family. It can operate under the control of the current versions of the same communication program products as the IBM 3725: NCP (Version 4), EP (Release 3 and 4), PEP. (See the Sales Manual Pages of the Program Products to determine the software supported by each model).
- The 3720 mdl 2 and 12 have been designed specifically for operating in a remote environment. A remote switched console, new unattended operation facilities, and the Remote

Support Facility allow the control of a 3720 from remote control centers.

- Attachment of up to 28 lines to the 3720 Mdl 1 and 2. Addition of the 3721 Expansion Unit to the 3720 Mdl 1 or 2 expands this capability to 60 lines, either duplex or half duplex. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.
- Attachment of up to 2 IBM Token-Ring Networks and up to 16 lines to the 3720 Mdl 11 and 12. Addition of the 3721 Expansion Unit to the 3720 Mdl 11 or 12 expands this capability to 48 lines, either duplex or half duplex, plus two Token-Ring Networks. The 3721 Expansion Unit does not provide attachments to IBM Token-Ring Networks. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.

The 3720 mdls 1 and 2 are field-upgradable to mdls 11 and 12 respectively.

- One or two channel adapters in the 3720 Mdl 1 and 11 to connect to the byte multiplexer, block multiplexer or selector channels of host processors.

Up to two Two Processor Switches (TPSs) to allow one or two channel adapters to be attached to 2 processor channels with non-simultaneous communication.

- 10MB Hard Disk: This disk provides additional storage space. This storage is used for the support of files used by MOSS.
- The 3720 improves the support of high speed lines: By use of a data transfer of 64 byte blocks, four 56K bps or 64K bps, or five 48K bps full-duplex lines can be attached to a scanner, instead of two with the previous IBM 3725 scanners. This enhancement decreases the cost of high speed line attachments.

- Simplified machine structure: The machine structure is simplified by use of a reduced number of required features: five types of line interfaces, one type of Token-Ring interface, one storage feature, and one type of channel adapter. The communication scanners and internal clock controls are included in the base units and the line interfaces may be added or moved by the customer. This allows easy additions and changes to the machine configuration.

- All units except 3720 mdls 1 and 11 (channel attached) are customer set-up (CSU). Configuration upgrades by addition, removal, rearrangement of LICs and TICs can be done by the customer. Such a facility allows easier changes of line configurations and provides additional problem determination facilities.

- Maintenance and Operator Sub-System (MOSS) problem determination facilities are improved: Like the IBM 3725, the 3720 provides a functionally separate processor, which facilitates maintenance and problem determination by providing:

- box event recording
- alert mechanisms
- display of machine status
- diagnostics for the Central Control Unit (CCU), channel adapters, scanners and line interfaces
- utilities to collect microcode dumps and 3720/3721 configuration data and send them to the host for printing
- menus displayed on the screen of the console to provide guidance to the operator.

MOSS facilities are enhanced with the following functions:

- New options for 3720 operations:

- ▲ Storing of an ACF/NCP V4R2 or ACF/NCP Version 4 Subset load module in the 3720: At the request of the network operator, the load module is first loaded from the host into the 3720 memory and then automatically saved onto the 3720 disk. No ACF/NCP control program can be active in the 3720 during this operation.
- ▲ Automatic load and dump of NCP: This option can be individually assigned to a 3720 by the network operator during activation of the NCP. After a power outage, the MOSS re-IPLs the 3720 with the NCP load module stored on the disk, without operator intervention. In case central control unit failure or software error, a dump of the NCP storage is automatically saved on the 3720 disk before the re-load sequence begins. At the completion of the loading, the 3720 notifies the network operator of the outcome of the process: load successful or not, dump available or not. In case of an unsuccessful load, the network operator must initiate an NCP load from the host.
- ▲ Transfer of the NCP dump: After notification that an NCP dump has been saved by a 3720, the network operator can request the online retrieval and transmission to the host. This transfer may involve the full dump (to be stored in the host library) or partial dump (to be displayed at the network console). The NCP dump stored on the 3720 disk must be retrieved and/or erased by the network operator before a new NCP dump can be saved on the 3720 disk. When there is an NCP dump already stored on the disk, the automatic load of NCP is performed without dump of the storage, unless the error condition takes place within 10 minutes of the end of NCP initialization. In this case, there is no automatic dump/load process and the 3720 waits for an intervention of the network operator.
- ▲ Loading of the NCP from the load module stored on 3720 disk at operator request either from the network console, or from the 3720 local/remote console, or from the 3720 operator panel.
- Automatic scanner re-IML in case of failure: This new facility further improves the availability of the communication scanner.

When a scanner fails, the MOSS will take a scanner dump and re-IML this scanner without operator intervention. At the completion of these actions, the MOSS will notify the host of the outcome of the operations. If they were successful, the lines of this scanner may be reactivated from the host. If they were not successful, manual intervention will be required at the local or remote 3720 operator console.
- Automatic analysis of Box Event Records (BERs): MOSS analyzes automatically the box event records and provides a reference code which will be used by the customer and the IBM service organization for determining the probable cause of failure, and the action to be taken (see section Problem Determination).
- All internal clocks set by software: The MOSS operator console is now used to set the speed of the clock, for direct attached synchronous terminals. Previously, hardware straps had to be put in place by IBM service personnel. Speeds are set by line, not by LIC as in the 3725. The speed for other type of attachments, including direct attachment of asynchronous terminals, is specified via the SSP program product, as previously.
- Support of IBM Communication Network Management (CNM) direction: The 3720 supports IBM's CNM direction by sending error related information to the NetView or NPDA (Network Problem Determination Application) program product running in a host processor.

Alerts generated for 3720 are displayed on the network control terminal by NetView (MVS, VM) or NCCF/NPDA (VSE). If Netview or NCCF/NPDA are not available, the alerts will be displayed on the VTAM console (except for the IBM Token-Ring Network alerts) by certain VTAM releases. See the Sales Manual Pages of the Program Products to determine which VTAM releases provide this capability.

This enhanced CNM support further improves the problem determination facilities in an SNA network by allowing an easier identification of the failing unit in the SNA network.

- Support of IBM 586X modem Link Problem determination Aid (LPDA 2) enhancements.
- Support of IBM and non-IBM DTE's with X.25 interface: This support is provided by the X.25 SNA Interconnection PRPQ. It is then possible to convey X.25 traffic using the SNA backbone network and the SNA transport facilities.

The IBM CNM's direction is emphasized for X.25 resources by using the X.25 SNA Network Supervisory Function (NSF) PRPQ in the SNA host processor.

- Remote Support Facility (RSF): RSF allows IBM support specialist, at the Hardware Central Service, to diagnose 3720 problems remotely (see "Maintenance Facilities" section). RSF will improve the availability of the 3720 by allowing an IBM support specialist to handle a problem sooner, by allowing microcode problems to be fixed quicker without on-site assistance, and by allowing the required part to be ordered before the IBM service representative comes on site for the hardware maintenance.
- Maintenance via Remote Support Facility (RSF): Customers with a machine covered under purchase warranty or IBM maintenance agreement and the required hardware configuration will be entitled to connect to an IBM Remote Support Facility (RSF).

Any terminal, which is equivalent to a 3101 Mdl 23, may be used as a console, such as: the 3161 Mdl 11 or 12 running in 3101 mode, the 5150 or 5160 running the IBM 3101 Emulation Program (6024-042), the 3163 Mdl 11 or 12 running in 3101 mode, and the 3164 Mdl 11 or 12 running in 3101 mode.

A 1200 bps duplex modem compatible with the Bell 212A operating in Asynchronous mode with auto-answer, is required to connect the remote console via the switched telephone network.

A customer provided modem compatible with a Bell 212A operating in Synchronous mode with auto-answer at 1200 bps over the public switched telephone network is required to attach to the RSF port. This modem has to be compatible with the modems installed at the supporting RSF site.

- Microcode Releases: Mandatory Microcode 'Engineering Changes' will be automatically shipped to the customer.

Machine Organization

Base Machine: The 3720 Mdl's 1, 2, 11 or 12 are the base machines and contain:

- Central Control Unit
- Main Storage of 1MB
- 10M byte Disk
- Diskette Drive
- Maintenance and Operator Sub-System (MOSS)
- One Communication Scanner including internal clock controls.

The internal clock supports the following bit rates:

- Category 1 Rates

MACHINES

- ▲ 50, 110, 134.5, 200, 300, 600 and 1200 bps for start/stop or synchronous operation.
- ▲ 75, 100, 2400, 4800, 9600 and 19200 bps for start/stop operation only.

The transmission may be duplex or half-duplex to modem attached or directly attached terminals.

- Category 2 Rates

- ▲ 2400, 4800, 9600, 19200, 38400, 55885 and 245760 bps for directly attached synchronous terminals.

Category 1 speeds are set by NCP or EP. Category 2 speeds are set from the operator console.

The 3720 Mdl 1 and 11 also provide:

- One basic Channel Adapter (CA) plus one optional CA

They attach to a byte multiplexer, block multiplexer or selector channel of an IBM 4341, 4361, 4381, 303X, 308X, 3090 or 937X host processor. Where the processor is not a 303X or a 937X, they attach (only with ACF/NCP) also to the IBM 3044 Fiber Optic Channel Extender Link, allowing one to install the 3720 Mdl 1 or 11 at up to 2km (6666 ft) from the host. They attach also to the IBM 3044 Fiber Optic Channel Extender Link, allowing to install the 3720 Mdl 1 and 11 at up to 2 km (6666 ft) from the host except with 303X.

- Up to two Two Processor Switches (TPSs), which allow a channel adapter to be attached to 2 processor channels with non-simultaneous communication.

The 3720 Mdl 1 or Mdl 2 may contain in addition:

- One storage increment of 1MB
- Up to seven Line Interface Couplers (LICs) Type 1, 2, 3, 4A, 4B.

The 3720 Mdl 11 or Mdl 12 may contain in addition:

- One storage increment of 1MB
- Up to four Line Interface Couplers (LICs) Type 1, 2, 3, 4A, 4B.
- Up to two Token-Ring Interface Couplers (TICs) Type 1

The 3720 mdls 1 and 2 are field-upgradable to models 11 and 12 respectively.

Expansion: One 3721 Expansion Unit may be connected to the 3720. The 3721 Expansion Unit is installed on top of the 3720 and allows attachment of up to 32 additional lines.

Two models are available: Mdl 1 has one scanner controlling up to 8 LICs, Mdl 2 has two scanners controlling 4 LICs each. See 3721 Expansion Unit sales pages for additional information.

Operator Console: For the integration of the 3720 in the network and for problem determination, a user provided control terminal is required as the operator console.

(Except Brazil> This terminal may be directly attached (local) or attached via a modem and a switched telephone line (remote). The attachment is only required while the above-mentioned operations are performed.

Any terminal, which is equivalent to IBM 3101 Mdl 23, may be used as a console, such as: the IBM 3161 model<) 11 or (Except Brazil> 12 running in 3101 mode, the IBM PC<) 5550, (Except Brazil> 5150 or 5160 running the IBM 3101 Emulation Program<) no. 6024-042, (Except Brazil> the IBM 3163 model<) 11 or (Except Brazil> 12 running in 3101 mode, and the IBM 3164 mdl<) 11 or (Except Brazil> 12 running in 3101 mode.

A single remote operator console may be used to manage multiple 3720s by attaching it to each 3720 via a modem and a switched communication line.

Customers running EP only (no NCP/PEP) should provide a console in order to receive error alerts normally available at the VTAM op-

erator console.<) (Brazil only> A directly attached 3727 console is required.<)

Performance: The maximum number of lines and IBM Token-Ring Networks capable of concurrent operation is a function of line speed, line protocols, the 3720 control program installed and the application work load. The number of lines which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in the customer's situation.

The HONE Configurator CF3725 or the 3720 Configuration Guide should be used to perform such an analysis.

Maintenance Facilities

Remote Support Facility (RSF): Customers with a machine covered under purchase warranty, lease/rental or IBM maintenance agreement and the required hardware configuration will be entitled to connect to an IBM Remote Support Facility (RSF).

RSF allows IBM product specialists in a remote support location to establish a connection with the customer's 3720, after customer authorization. These product specialists can, from the support location, monitor machine operation or perform problem diagnosis on the 3720. These capabilities include remote examination of machine error records and the remote initiation of diagnostic programs. Utilization of RSF may improve the availability of the 3720 by shortening the total time necessary to analyze a hardware failure, identify a likely failing component and to dispatch a part and service representative to the machine's location.

In addition the product specialists will also be able to use the remote console facilities from their terminal. Product Engineering will have the capability to transfer temporary patches to the customer's machine to solve very urgent situations.

Problem Determination Procedures: The automatic analysis of Box Event Records (BERs) is a new MOSS function which facilitates the problem determination. BERs are analyzed automatically by MOSS which provides an reference code in the alert sent to the network operator.

This reference code allows a faster problem determination. For simple problems, the customer can identify more easily, in the 3720 Problem Determination guide, for each reference code, the probable cause of failure, and the recommended actions.

If the problem is more complex and assistance of Customer Engineering service is necessary, the customer will report the reference code to them. The IBM service personnel will use this code to identify suspected FRUs (field replaceable unit) remotely. This may eliminate on-site analysis and wait time for required parts, resulting in reduced controller outage time.

Customer Responsibilities: See M2700 sales pages.

Communications Facilities: The 3720 operates over PTT provided or equivalent customer owned communication facilities. For information concerning these facilities, see the M2700 sales pages.

Data Communication Equipment

IBM Modems: The following IBM modems or units may be used with the 3720:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1/2	2400/1200	Nonswitched or switched voice grade
3864-1/2	4800/2400	Nonswitched or switched voice

3865-1/2	9600/4800	grade Nonswitched voice grade
3868-1	2400/1200	Nonswitched voice grade
3868-2	4800/2400	Nonswitched voice grade
3868-3/4	9600/4800	Nonswitched voice grade
5811-10	2400/4800/ 9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400/4800/ 7200/9600	Nonswitched baseband
5811-28		Rack mount version of 5811-20
5812-10	2400/4800/ 7200/9600	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-2/3	9600/7200/ 4800	Nonswitched voice grade
5866-2/3	14400/9600	Nonswitched voice grade
5868-52		Rack mount version of 5865-2
5868-62		Rack mount version of 5866-1/2

Note: 4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

PTT Mandatory DCEs: The 3720 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.24, V.28, ISO Standard 2110 and the relevant CCITT Recommendations for data transmission speed.

The 3720 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.35 and ISO Standard 2593.

Public Data Networks: Public Data Networks are attached as listed in the charts of the M2700 sales pages.

Non-IBM DCEs: Non-IBM DCEs complying with EIA RS-232C, CCITT Recommendations V.24/V.28 or V.35 may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.

Automatic Calling Equipment: The 3720 attaches the PTT mandatory autocal equipment complying with CCITT Recommendation V.25 and ISO Standard 2110.

OEM automatic calling equipment which comply with EIA RS-366 or CCITT Recommendation V.25 may be attached under the provisions of the IBM Multiple Supplier Systems Policy.

Configuring and Ordering Procedures

- For a new machine: A new machine must be configured with the aid of the HONE Configurator CF3725, or the "Configuration Guide", GA33-0063. Either procedure yields a list of feature codes and specify codes, which is used to order the machine, and a pictorial diagram showing the positions of the LICs. A copy of this diagram should be given to the customer, as it will be needed to generate NCP or EP and to plan the installation of the LIC cables i.e., the DCE and other communication cables.

A copy of the CF3725 output of 3720 Mdl 1 and 11 must also be given to Customer Engineering as it will be needed to install the LIC cables.

At order confirmation time the machine configuration must be verified by the configurator CF3725.

An operator console is required. It may be locally or remotely attached.

- For an MES: The HONE Configurator CF3725 or the Configurator Guide and the setup form of the machine may be used to configure the MES. This procedure yields an updated pictorial diagram of the LICs and a list of feature codes and specify codes which is used to order the MES.
- External Cables: Note: 3720/3721 LIC cables are NOT interchangeable with 3705/3725 LIC cables.

External cables are ordered via MES or cable order form.

(Canada, Latin America, Taiwan only> IBM supplies TIC cables at standard length of 23 meters, LIC and console cables at standard length of 13.5m, except for direct attached DTEs on LIC Types 4A and 4B, where the standard length is 30 meters. Order the corresponding cable group as defined in the the Planning and Site Preparation Guide (PSPG). These cables are shipped from Poughkeepsie.

For shorter cables or for channel cables, order the corresponding cable group at the specified length as defined in the PSPG.

For longer cables, order by P/N at the specified length on < (Latin America, Taiwan only> an MES <) (Canada only> a cable order form 2642. <) (Canada, Latin America, Taiwan only> These cables are shipped from Poughkeepsie. Inquire into the <) (Latin America, Taiwan only> QSLM file <) (Canada only> FED parts price list <) (Canada, Latin America, Taiwan only> for prices. <)

(Except Canada, Latin America, Taiwan> Order all cables by cable group number as shown under "3720 Custom Length Cables" in the PSPG. These cables are shipped from Fujisawa. <)

For additional information on the available cable types and lengths, refer to the "Planning and Site Preparation Guide", GA33-0061.

For the basic channel adapter of the 3720 Mdl 1 and 11 order cable groups #3920 and EPO cable group #1178, if required.

For the direct attached Operator Console, IBM supplies a cable of up to 13.5m. This cable is obtained by ordering cable group #1631 or #1633 depending on the type of console. Additional length up to 150m may be ordered by MES.

For the modem attaching to the remote operator console port IBM supplies a cable of up to 13.5m. This cable is obtained by ordering cable group #1632.

The same cable type attaches the modem used for RSF (Remote Support Facility).

SPECIFY

These specify codes are only available at time of manufacture.

- Voltage: (Canada only> 3720-1/11 208 or 240V 60 Hz: no specify code is required. Specify #2822 if 120V 60 Hz are needed. 3720-2/12 120V 60 Hz: no specify code is required. Specify #2793 if 208 or 240 V 60 Hz are needed. <)

(Except Canada> No specify code is required to order the default option, which is high voltage (200 to 240 V) and 50 Hz. If other than the default option is required then specify:

#2822 for low voltage (100 to 127 V) and 50/60 Hz
#2793 for high voltage and 60 Hz <)

- Power Cord: (Canada only> 3720-1/11 A 4.3m cord with non-locking plug is standard. No specify code required. Specify #9986 for a 1.8m power cord, #9980 if a locking plug is

needed and #9020 if a moisture resistant plug is needed. 3720-2/12 A 4.3m cord with non-locking plug is standard. No specify code required. Specify #9986 for a 1.8m power cord and #9890 if a locking plug is needed and #9020 if a moisture resistant plug is needed.<)

(Except Canada and Japan> No specify code is required. For most countries the most commonly used plug will be selected by the 3-digit country number and the ordered voltage and frequency. Refer to the "Planning and Site Preparation Guide", GA33-0061, for details on the available plugs.

If other than standard is required, specify #2710 for a power cord without plug.<)

(Japan only> No specify code is required to order a non-locking plug. Specify #9890 if a locking plug is required for the low voltage. The locking plug is not available for the high voltage.<)

- Machine Nomenclature: No specify code is required to order the default option.

The default options are:

Argentina	Spanish
Bolivia	Spanish
Chile	Spanish
Colombia	Spanish
Costa Rica	Spanish
Dominican R.	Spanish
Ecuador	Spanish
El Salvador	Spanish
Guatemala	Spanish
Haiti	Spanish
Honduras	Spanish
Mexico	Spanish
Nicaragua	Spanish
Panama	Spanish
Paraguay	Spanish
Peru	Spanish
Uruguay	Spanish
Venezuela	Spanish
Others	English

If other than the default option is required then specify as follows:

#2924 for English
#2928 for French
#2931 for Spanish

- Documentation Group:

All machines are shipped with English publications. In addition translated documents, as listed in the default options or if specified as indicated below, are shipped.

The default options are:

Argentina	Spanish
Bolivia	Spanish
Chile	Spanish
Colombia	Spanish
Costa Rica	Spanish
Dominican R.	Spanish
Ecuador	Spanish
El Salvador	Spanish
Guatemala	Spanish
Haiti	Spanish
Honduras	Spanish
Japan	Kanji
Mexico	Spanish
Nicaragua	Spanish
Panama	Spanish
Paraguay	Spanish
Peru	Spanish

Uruguay Spanish
Venezuela Spanish

If other than the default option is required then specify as follows:

#0077 for Canadian French
#0073 for Kanji
#0060 for Spanish

- Safety Labels: No specify code is required to order the default option.

The default options are:

Argentina	Spanish
Bolivia	Spanish
Brazil	Portuguese
Chile	Spanish
Colombia	Spanish
Costa Rica	Spanish
Dominican R.	Spanish
Ecuador	Spanish
El Salvador	Spanish
Guatemala	Spanish
Haiti	Spanish
Honduras	Spanish
Japan	Kanji
Mexico	Spanish
Nicaragua	Spanish
Panama	Spanish
Paraguay	Spanish
Peru	Spanish
Uruguay	Spanish
Venezuela	Spanish
Others	English

If other than the default option is required then specify as follows:

#0924 for English
#0938 for English/French
#0930 for Kanji
#0933 for Portuguese
#0931 for Spanish

SPECIAL FEATURES

The base 3720 may be upgraded by the addition of the following features.

Second Channel Adapter (#1561): Provides the logical and physical interface between a 3720 Mdl 1 or 11 and an IBM 4341, 4361, 4381, 303X, 308X, 3090, or 937X host processor. It attaches to a byte multiplexer, block multiplexer or selector channel. Where the processor is not a 303X or a 937X, they attach (only with ACF/NCP) also to the IBM 3044 Fiber Optic Channel Extender Link. It may be equipped with a Two Processor Switch. With this feature order channel cable groups #3920 and EPO cable group #1178, if required. Maximum: One per 3720 Mdl 1 or 11. Prerequisites: None. Limitation: Not available on 3720 Mdl 2 or 12. The combination 3720/3044/303X is not supported. Field Installation: Yes.

Line Interface Coupler (LIC) Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. Each interface may also be used as a port for EIA RS-366/V.25, X.20bis, or X.21bis. LIC Type 1 provides direct (modemless) attachment at up to 19200 bps. Cables: For each LIC type 1, four cables must be ordered, for DCE, autocal equipment and/or direct attachment. Order cable group #1604 for DCE attachment, or cable group #1621 for attachment to NTT DCEs, cable group #1616 for attachment to automatic calling units, or cable group #1634 for attachment to NTT automatic calling units, cable group #1607 for direct attachment of asynchro-

nous DTEs like 3161, 3163, 3164, 3101 and TTY 33/35, or cable group #1611 for direct attachment of synchronous DTEs. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Seven per 3720 Mdl 1 or 2. Four per 3720 Mdl 11 or 12. Prerequisites: None. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 2 (#4921): Provides attachment for one communication line at speeds up to 256K bps. LIC Type 2 supports either duplex or half duplex data transmission. It has a digital interface for attachment to a non-switched "wideband" Type 8751, 8801 or 8803 Service. Cables: For each LIC type 2 order one cable group #1614. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable length. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Seven per 3720 Mdl 1 or 2. Four per 3720 Mdl 11 or 12. Prerequisites: None. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 3 (#4931): Provides attachment for one non-switched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 245.76K bps. Cables: For each LIC type 3 order one cable group #1613 for DCE attachment or cable group #1605 for direct attachment. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Seven per 3720 Mdl 1 or 2. Four per 3720 Mdl 11 or 12. Prerequisites: None. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in IBM SRL GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and non-switched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps. Cables: For each LIC Type 4A four cables for DCE and/or direct attachment must be ordered. Order cable group #1606 for DCE attachment or cable group #1608 for direct attachment. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. This LIC operates at transmission speeds up to 9600 bps. Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Seven per 3720 Mdl 1 or 2. Four per 3720 Mdl 11 or 12. Prerequisites: None. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 4B (#4942): Provides one CCITT X.21 interface as defined in IBM SRL GA27-3287 for a communication line operating at speeds up to 256K bps. Both switched and non-switched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 245.76K bps. Cables: For each LIC Type 4B order one cable group #1606 for DCE attachment or one

cable group #1608 for direct attachment. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Seven per 3720 Mdl 1 or 2. Four per 3720 Mdl 11 or 12. Prerequisites: None. Field Installation: Yes, by customer.

Token-Ring Interface Coupler (TIC) Type 1 (#4991): The TIC is a set of components and a microprocessor running under the control of a resident microcode which controls the IBM Token-Ring Network using standard protocols. The TIC operates under the control of ACF/NCP only. It provides one attachment to an IBM Token-Ring Network. Cables: For each TIC Type 1 order one cable group #1666. When the 3720 is installed in an IBM Token-Ring Network where IBM Cabling System Type 3 Specified Media (telephone twisted pair) is used, a Data Grade Media to Type 3 filter is required between the 3720 TIC cable and the telephone twisted pair wiring. Refer to "IBM Token-Ring Network Twisted Pair Media Guide", GA27-3714. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Maximum: Two per 3720 Mdl 11 or 12. Limitation: Not available on 3720 Mdl 1 or 2. Field Installation: Yes, by customer.

Storage Increment 1MB (#7100): Provides a main storage increment of 1MB to allow up to 2MB of memory. Maximum: One per 3720. Field Installation: Yes.

Two Processor Switch (#8320): Provides a second channel interface to attach the first or the second channel adapter to a Multiprocessor System (MP) or to two channels of the same or different processors, with non-simultaneous communication. With this feature order channel cable groups #3920 and EPO cable group #1178, if required. Maximum: Two per 3720 Mdl 1 or 11. Prerequisites: None for the first #8320. First TPS (#8320) Channel Adapter (#1561) for the second #8320. Limitation: Not available on 3720 Mdl 2 or 12. Field Installation: Yes.

MODEL CONVERSIONS

Field conversions can be made from mdls 001 to 011 and from 002 to 012. No other changes are possible.

ACCESSORIES

Accessories are ordered via MSORDER (category = accessories/supplies) on AAS specifying the following part numbers:

- #1643894 - Additional key to open the 3720/3721 covers
- #6398770 - Additional empty cassette to replace LICs or TICs being removed

SUPPLIES (NONE)

3721 EXPANSION UNIT

PURPOSE

Provides additional line attachment capability to the 3720 Mdl 1, 2, 11 or 12 Communication Controllers.

MODELS

Model 1 001: Expansion Unit with one scanner.

Model 2 002: Expansion Unit with two scanners.

Customer Setup (CSU): The 3721 Mdl 1 and 2 are designated Customer Setup thereby offering the customer early availability and re-location flexibility.

HIGHLIGHTS

Allows attachment of up to 32 additional lines to 3720 Mdl 1, 2, 11, or 12. It is available in two versions:

- 3721 Mdl 1, which is equipped with one communication scanner controlling 8 LICs.
- 3721 Mdl 2, which is equipped with two communication scanners controlling 4 LICs each.

Internal clock controls are included for all the LICs. The supported bit rates are the same as for 3720.

Communications Facilities: The 3721 operates over PTT provided or equivalent customer owned communication facilities. For information concerning these facilities, see the M2700 sales pages.

Data Communication Equipment: The 3721 attaches the same DCEs as the 3720.

Configuring and Ordering Procedures: See the M3720 pages.

SPECIFY

These specify codes are only available at time of manufacture.

- **Voltage:** (Canada only) Specify the same voltage as the one used by the associated 3720 i.e., #2822 for 120 V 60 Hz and #2793 for 208 or 240 V 60 Hz. < (Except Canada) No specify code is required to order the default option, which is high voltage (200 to 240 V) and 50/60 Hz. If other than the default option is required then specify:
 - #2822 for low voltage (100 to 127 V) and 50/60 Hz <
- **Safety Labels:** No specify code is required to order the default option.

The default options are:

Argentina	Spanish
Bolivia	Spanish
Brazil	Portuguese
Chile	Spanish
Colombia	Spanish
Costa Rica	Spanish
Dominican R.	Spanish
Ecuador	Spanish
El Salvador	Spanish
Guatemala	Spanish
Haiti	Spanish
Honduras	Spanish
Japan	Kanji
Mexico	Spanish

Nicaragua	Spanish
Panama	Spanish
Paraguay	Spanish
Peru	Spanish
Uruguay	Spanish
Venezuela	Spanish
Others	English

If other than the default option is required then specify as follows:

- #0938 for English/French
- #0930 for Kanji
- #0933 for Portuguese
- #0931 for Spanish
- #0924 for English

SPECIAL FEATURES

The base 3721 may be upgraded by the addition of the following features.

Line Interface Coupler (LIC) Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. Each interface may also be used as a port for EIA RS-366/V.25, X.20bis, or X.21bis.

LIC Type 1 provides direct (modemless) attachment at up to 19200 bps.

Cables: For each LIC type 1, four cables must be ordered, for DCE, autocal equipment and/or direct attachment. Order cable group #1604 for DCE attachment, or cable group #1621 for attachment to NTT DCEs, cable group #1616 for attachment to automatic calling units, or cable group #1634 for attachment to NTT automatic calling units, cable group #1607 for direct attachment of asynchronous DTEs like 3161, 3163, 3164, 3101 and TTY 33/35, or cable group #1611 for direct attachment of synchronous DTEs. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Eight per 3721. Prerequisites: None. Specify: #9211 for LICs type 1 connected to the second scanner for 3721 Mdl 2. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 2 (#4921): Provides attachment for one communication line at speeds up to 256K bps. LIC Type 2 supports either duplex or half duplex data transmission. It has a digital interface for attachment to a non-switched "wideband" Type 8751, 8801 or 8803 Service. Cables: For each LIC type 2 order one cable group #1614. Refer to the "Planning and Site Preparation Guide", GA33-0061 and GC22-7064, for information on available cable length. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Eight per 3721. Prerequisites: None. Specify: #9221 for LICs type 2 connected to the second scanner of 3721 Mdl 2. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 3 (#4931): Provides attachment for one non-switched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 245.76K bps. Cables: For each LIC type 3 order one cable group #1613 for DCE attachment or cable group #1605 for direct attachment. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Eight per 3721. Prerequisites: None. Specify: #9231 for LICs type 3 connected to the second scanner of 3721 Mdl 2. Field Installation: Yes, by customer.

MACHINES

M 3721.2
JUN 86
NEW

Line Interface Coupler (LIC) Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in IBM SRL GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and non-switched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps. The DTEs directly attached to the same LIC must operate at the same speed. Cables: For each LIC Type 4A four cables for DCE and/or direct attachment must be ordered. Order cable group #1606 for DCE attachment or cable group #1608 for direct attachment. Refer to the "Planning and Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. This LIC operates at transmission speeds up to 9600 bps. Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Eight per 3721. Prerequisites: None. Specify: #9241 for LICs type 4A connected to the second scanner of 3721 Mdl 2. Field Installation: Yes, by customer.

Line Interface Coupler (LIC) Type 4B (#4942): Provides one CCITT X.21 interface as defined in IBM SRL GA27-3287 for a communication line operating at speeds up to 256K bps. Both switched and non-switched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 245.76K bps. Cables: For each LIC Type 4B order one cable group #1606 for DCE attachment or one cable group #1608 for direct attachment. Refer to the "Planning and

Site Preparation Guide", GA33-0061, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. Refer to the "3720 Configuration Guide", GA33-0063, to determine the number of LICs which may be connected to a given scanner. Maximum: Eight per 3721. Prerequisites: None. Specify: #9242 for LICs type 4B connected to the second scanner of 3721 Mdl 2. Field Installation: Yes, by customer.

- #6398770 - Additional empty cassette to replace LICs or TICs being removed

SUPPLIES (NONE)

3725 COMMUNICATION CONTROLLER MODEL 1

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 3725 Model 1 controls data communications between modem-attached or directly-attached (without a modem) or IBM Token-Ring Network attached terminal devices and one or more directly- or remotely-connected S/370 (except mdls 115 and 125), 303X, 308X, 3090, 43XX, 9370 host processors, or between two host processors. Remote connection may be via PTT -provided or customer-owned communication facilities. The 3725 mdl 1 is the base machine. An optional 3726 provides additional line and channel attachment capability. A 3727 console is required for installation, operation, and maintenance.

The following is a brief summary of the 3725 Communication Controllers:

Comm Cntrlr	Max Lines*	Max Host Stg	Host Program	Comm Cntrl Program
3725-1	256 256	3M 1M	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	80 80	3M 1M	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach, CF3725 is required to predict actual line attachment capabilities.

See individual pages for each Communication Controller and for information on additional features.

MODEL 1

Model 1 001

Prerequisites: If channel-attached, the 3725 requires a control unit position on a system channel. See processor pages for details. When attaching to a 4321 or 4331 in EP mode, restrictions are imposed on the number of available subchannels which may be used by the 3725. On the 9370 processors, EP and PEP modes are not supported.

HIGHLIGHTS

The 3725 is a modular, programmable communication controller, which runs under the control of:

- Either ACF/NCP Version 2 for the 3725 or EP/3725 R1 or both in PEP mode.
- Or ACF/NCP Version 3 or Version 4 or EP/3725 R2 or both in PEP mode. (See Program Products and SCP sections for details.)

Its programmability allows a high degree of flexibility in tailoring a data communications system to the customer's requirements. In addition, it plays an active role in Communications Network Management (CNM) by providing data to the Network Communications Control Facility (NCCF) and the Network Problem Determination Application (NPDA).

The machine structure is simplified by having a small number of features: Five types of line interfaces, one storage feature, one type of communication scanner and one type of channel adapter. This allows easy additions and changes to the machine configuration.

Characteristics of the 3725 include:

- LSI technology for better RAS characteristics, lower power consumption, and less floor space than previous communication controllers.
- Increased internal performance (compared to the 3705-II) for high-speed lines and large networks.
- Attachment of high-speed lines which use the modulo 128 function of ACF/NCP for INN and BNN links.
- 512K bytes up to 3M bytes of main storage, by 256K byte increments, to accommodate larger networks and higher speed lines.
- Maintenance and Operator Subsystem (MOSS), a functionally separate processor, facilitates maintenance and problem determination by providing:
 - box error logging
 - alert mechanisms
 - display of machine status
 - diagnostics for the Central Control Unit (CCU), channel adapters, scanners and line interfaces
 - utilities to:
 - ▲ collect microcode dumps and send them to the host for printing
 - ▲ provide actual configuration data, help the customer to plan for MES, and store this information on the MOSS diskette via the Graphic Configuration File for further console display or update. This information can be transferred to the host where the machine diagram can be printed by ACF/SSP
 - ▲ allow the operator to keep a current Line Description File, providing the physical address, symbolic name, speed, and protocol of each connected line. This file, stored on the MOSS diskette, may be transferred to the host and printed by ACF/SSP.
- Improved RAS Characteristics:
 - Reliability and availability of the 3725 are enhanced by the following elements:
 - ▲ Extensive error detection, including storage protection against inadvertent overlays
 - ▲ Functional building block design (most adapter errors are contained within a single building block and thus will not take the system down)
 - ▲ Error correcting code for the main storage and scanner storage
 - ▲ Error by-pass facilities: Microcode re-IPLs, system re-IPLs and dynamic reconfiguration of SNA resources
 - ▲ Automatic first-level problem determination with alert messages, which report hardware errors to the network operator and recommend actions
 - ▲ Enhanced problem determination aids
 - ▲ Automatic power-on when power returns after loss
 - ▲ Port Swapping which allows the operator to logically swap a line from a failing port to a spare port without involvement of the host processor.
 - Serviceability of the 3725 is improved by:
 - ▲ Many host-independent functions for installation and maintenance

- ▲ Error information logging/retrieval
- ▲ Diagnostics and trouble shooting facilities
- ▲ Concurrent maintenance for MOSS diskette drive and console

- Network Management and Problem Determination: Considerable function has been designed into this communication controller to provide maximum availability to the customer. The 3725 MOSS provides problem determination and recovery procedures that are designed to be easily understood and used by the operator; e.g.:

- Stand Alone Link Test facility to test an SDLC Communication link attaching another 3725 or 3705, without involvement of a host or a control program.
- Line Interface Display to monitor at the console the status of most of the control leads on a line interface.

The 3725 supports IBM's CNM (Communications Network Management) direction by sending error related information to the Network Problem Determination Application (NPDA) running in a host processor under the support of the Network Communications Control Facility (NCCF). This enhanced CNM support provides better problem determination in SNA networks. The basic NCP problem determination functions (alerts) are also offered in the non-NPDA environment, but they are not available in EP mode.

- Attachment of up to 96 lines to the 3725: Addition of the 3726 to the 3725 expands this capability to 256 lines, either duplex or half-duplex. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.

Attachment of up to four separate IBM Token-Ring Networks to the 3725; addition of the 3726 to the 3725 expands this capability to eight separate IBM Token-Ring Networks.

- One or two channel adapters in the 3725 to connect to the byte multiplexer, block multiplexer or selector channels of host processors. Four more channel adapters can be installed in the 3726.
- Configuration Aids: The HONE Configurator CF3725 and the "Configuration Guide", SA33-0012, are available to IBM representatives to assist in configuring a 3725 to specific network requirements. The CF3725 configurator provides configurations with feature and specify codes, cable lists as well as storage and performance estimates. In CF3725 a number of sample configurations are also available for guidance.

Machine Organization: The 3725 mdl 1 contains:

- Central Control Unit: Executes instructions to control communication scanners and channel adapters. The CCU runs under the control of ACF/NCP for the 3725, EP/3725 or both in PEP mode.
- Main Storage: Houses a 3725 network control program (NCP, EP, PEP) and other program products loaded from the host processor and provides buffers for the data exchanged with the channel adapters and the lines. The base machine includes 512K bytes of storage as standard.
- Maintenance and Operator Subsystem (MOSS): Provides IPL and utility procedures for the 3725 mdl 1 operator. It includes an independent processor with its microcode, a diskette drive and an attachment for the operator console.
- Transmission Subsystem (TSS): Provides the physical connection to communication facilities. It consists of Line Attachment Bases (LABs) with microprocessor-based scanners, Line Interface Couplers (LICs) and optional Internal Clock Controls (ICCs). The base machine includes 2 LABs called CLABS. Each CLAB has one scanner and can attach up to 32 lines via optional LICs. Integrated DCEs (modems) are not available for the 3725 and 3726.
- Token-Ring Subsystem (TRSS): Provides the physical connection to IBM Token-Ring Network. It consists of Line and

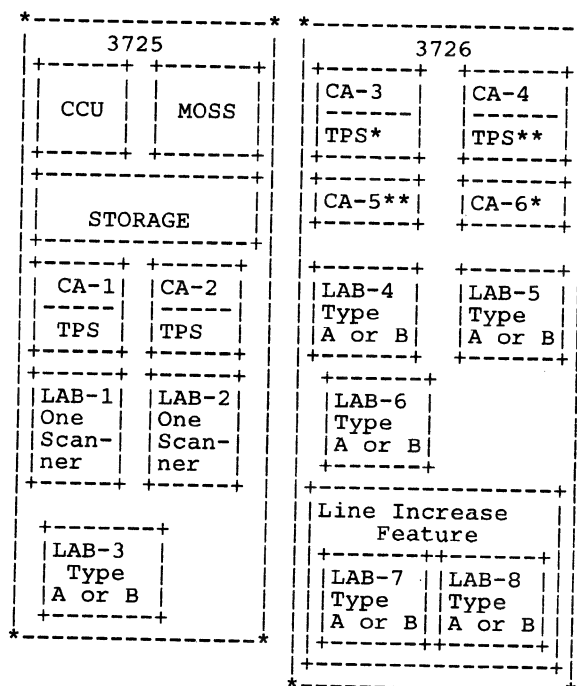

Token-Ring Attachment Bases (LABS) with Token-Ring Multiplexer and Token-Ring Interface Couplers (TICS).

The 3725 mdl 1 may also contain:

- Channel Adapters (CAs): Provide physical connection to host channels. An optional two processor switch allows a channel adapter to be attached to two processor channels, with non-simultaneous communication. The base machine provides a physical base for two Channel Adapters and two Two-Processor Switches.

Expansion: One 3726 Communication Controller Expansion may be connected to the 3725 mdl 1. The 3726 allows attachment of up to 160 additional lines and/or up to four additional single channel adapters or two additional channel adapters equipped with Two-Processor Switches. See M3726 pages for additional information.

Console: The 3725 mdl 1 requires a primary 3727 Operator Console for installation, operation and maintenance; see M3727 pages for details. A second 3727 Operator Console may be used as an alternate operator console. The operator consoles are directly attached; i.e., no DCEs (modems) are required. Only one operator console is active at a given time. The active console is selected by a switch on the 3725 mdl 1 control panel. See "Service Requirements" for additional information.

Note: The numeric suffixes indicate positions; e.g., LAB-3 means LAB in position 3. LAB-1 and LAB-2 are standard in the base 3725.

* exclusive
** exclusive

Position Numbering: Channel Adapter and LAB positions are numbered sequentially through both the 3725 and the 3726. Thus, Channel Adapter positions 1 and 2 are in the 3725 and Channel Adapter positions 3 through 6 are in the 3726. Similarly LAB positions 1, 2 and 3 are in the 3725 and LAB positions 4 through 8 are in the 3726. See figure above.

Customer Responsibilities: See M2700 pages. Also see EP and NCP Programming pages for attachment capability.

Communications Facilities: The 3725 operates over PTT -provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Remote Communication Controller: The 3725 can be used without channel connection to a host processor. Such a 3725 is termed "link-attached" and is connected via one or more communication links to channel-attached 3705s and/or 3725s. A link-attached controller has the same networking capabilities as a channel-attached one. Link attachment is a standard capability of the 3725; no special feature is needed.

For more information on the functions of a link-attached Communication Controller, see the Advanced Communications Functions for NCP (ACF/NCP) in the Program Products section.

Service Requirements: The 3725 requires a local (primary) 3727 Operator Console as the console for operation, as well as for installation and maintenance. Maximum distance is 7.5m (25 ft).

The 7427 Console Switching Unit (Special Product provided by RPO 8J5008) offers the capability to allow up to four 3725 machines to share a single primary operator console.

Service limitations are: A primary console is required for maintenance and must be available whenever service is to be performed. There must be no obstructing wall or door between the primary console and any attached 3725. The primary console must be available for maintenance personnel when called for servicing a 3725 or 3726.

Data Communication Equipment

Modems: The following IBM modems or units may be used with the 3725:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1/2	2400/1200	Nonswitched or switched voice grade
3864-1/2	4800/2400	Nonswitched or switched voice grade
3865-1/2	9600/4800	Nonswitched voice grade
3868-1	2400/1200	Nonswitched voice grade
3868-2	4800/2400	Nonswitched voice grade
3868-3/4	9600/4800	Nonswitched voice grade
3872-1	2400/1200	Nonswitched or switched voice grade
5811-10	2400/4800/9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400/4800/7200/9600	Nonswitched baseband
5811-28		Rack mount version of 5811-20
5812-10	2400/4800/7200/9600	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-2/3	9600/7200/	Nonswitched

5866-2/3	4800 14400/9600	voice grade Nonswitched voice grade
5868-52		Rack mount version of 5865-2
5868-62		Rack mount version of 5866-1/2

Note: 4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

PTT Mandatory DCEs: The 3725 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.24, V.28, ISO Standard 2110 and the relevant CCITT Recommendations for data transmission speed. The 3725 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.35 and ISO Standard 2593.

Public Data Networks: Public Data Networks are attached as listed in the charts of the M2700 pages.

Non-IBM DCEs: Non-IBM DCEs, complying with EIA RS-232-C, CCITT Recommendations V.24/V.28, V.35 or X.21, may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.

Automatic Calling Equipment: The 3725 attaches the PTT-mandatory autocal equipment complying with CCITT Recommendation V.25 and ISO Standard 2110.

OEM automatic calling equipment, which comply with EIA RS-366 or CCITT Recommendation V.25, may be attached under the provisions of the IBM Multiple Supplier Systems Policy.

Configuring and Ordering Procedures:

• For a new machine:

A new machine must be configured with the aid of the HONE Configurator CF3725, or the "Manual Configuration Guide", SA33-0012. Either procedure yields a list of feature codes and specify codes, which is used to order the machine, and a pictorial diagram showing the positions of the LABs, LICs and ICCs. A copy of this diagram should be given to the customer, as it will be needed when the NCP or EP is generated. At order confirmation time, the machine configuration must be verified by the configurator CF3725. A copy of the CF3725 output must be given to CE, as it will be needed to order and install the DCE and other communication cables.

Approximately 30 days before the machine is to be shipped, the plant will send a similar pictorial diagram to the branch office. It will include two more copies of this diagram with the machine documentation. One of these should be given to the customer, the other to CE.

A similar pictorial diagram, called the Graphic Configuration File, is stored on the MOSS diskette. Most of this file is generated by the 3725, but the customer is responsible for adding the LIC weights (see Transmission Subsystem for description of LIC weights) and for keeping them up to date when line protocols or speeds are changed. This information is required for subsequent MES orders.

A 3727 console must be ordered for each 3725, unless the 3725 is to share a console via the 7427 Console Switching Unit (RPO 8J5008).

• For an MES:

From the Graphic Configuration file stored on the MOSS diskette, a diagram of the actual machine configuration is obtained on the host printer. The HONE Configurator or the Configurator Guide and this diagram of the machine may be used to configure the MES. This procedure yields a list of feature codes and specify codes (including LIC weights), which is used to order the MES, and an updated pictorial diagram of the LABs, LICs and ICCs. A copy of the updated con-

figuration on the Graphic Configuration printout, marked with the MES order number, must be sent by the marketing representative to the servicing branch office for use by the CE detailing plugging information for installation planning purposes. This updated configuration is required by the CE as it provides the only source of internal machine feature location and plugging information for the LICs and ICCs.

To assist the customer and CE the MES number for the ordered LICs and ICCs as well as the LIC types and weights should be entered in the Graphic Configuration File when the MES is ordered. After installation of the MES, the CE verifies that the LICs and their weights in the Graphic Configuration File are consistent with the installation.

If LIC weight Specify Codes are not specified or if their combined weight exceeds standard initial order limits, then the Specify Code #6000 must be specified unless it is already on the machine history.

To relocate LICs or ICC within the same frame of a leased machine or to change the speed setting of an Internal Clock Control, submit a Record-Purpose-Only MES order with specify #5000.

To relocate LICs or ICC from one leased machine to another leased machine, concurrently submit a MES order for each machine. Specify #5000 on any order which contains reinstallations to avoid shipment of new material. A CE will perform the service, as per request from their sales office and by guidance from MES installation instruction in the Machine Installation Manual (MIM) Vol A03, Chapter 8, for instructions. Since specify code #5000 causes all LICs and ICCs on an order to be shipped as documents only, any feature additions should be ordered on a separate order.

Relocation of Line Attachment Bases, Channel Adapters, Two Processor Switches, Line Feature Increase, or Storage Increment are not possible.

On purchased machines, use RPQs for LIC or ICC relocation on the same machine, for LIC or ICC reinstallation on another machine, or for change of speed of an ICC.

• For cables:

External cables, except the cable for the primary console, are ordered via WTAAS or cable order form. Cables for the 3726 Communication Controller Expansion must be ordered with the 3726. (Canada, Latin America, Taiwan) IBM supplies LIC cables and alternate console cable at standard length, 13.5m (45 feet) long, except for direct-attached DTEs on LIC4A, LIC4B where the standard length is 30m (100 feet): order the corresponding cable group as defined in the IMPP. IBM supplies TIC cables at standard length, 23m (75 ft.): order the corresponding cable group as defined in the IMPP. For shorter cables, or for the alternate operator console cable up to 20m (64 feet) long or for channel cables, order the corresponding cable group at the specified length as defined in the IMPP. For longer cables, order cables by P/Ns, which are listed in the IM-PP (GC22-7064), at the specified length on (<) (Except Canada) an MES. (<) (Canada only) a cable order Form 2642. (<) These cables include installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the (Except Canada) QSLM file (<) (Canada only) parts price list (<) for prices. (except Canada, Latin America, Taiwan) Order all cables by cable group number as shown under "3725/3726 Custom Length Cables" in the IMPP and as listed in the following table:

Regular Order

Related Feature Code	Cable Grp #	Max Lngth m(ft)	Purpose
1561(CA)	3920	62.0	
or		(200)

4991	23	Token-Ring
(TIC1)	(75)	Att.
3727	20.0	Alt.
Console	(64)	Console(<)

The primary operator console is installed with an attachment cable of 7.5m (25 ft) maximum, which is included in the shipping group of the 3725. For the Alternate Operator Console, IBM supplies a cable of up to 20m (65 ft). This cable is obtained by ordering cable group #0099. Additional length up to 150m (490 ft) may be ordered by RPQ.

Channel Adapters: The 3725/3726 Channel Adapter attaches to a host channel to provide communications with S/370 (except mds 115 and 125), 303X, 308X, 43XX, 9370 Processors.

A Two-Processor Switch allows a Channel Adapter to be connected to two processor channels instead of one. The channels may belong to the same or different processors. Data transfers occur on only one channel interface at a time. Manual switches on the 3725 control panel allow the user to enable both channel interfaces, one interface or the other, or neither interface. In the case where both interfaces are enabled, the processors are responsible for resolving any contention, since only one interface can transfer data at a time. In this mode the TPS provides functions comparable to the 3705 CA Type 3.

The Channel Adapters must occupy contiguous positions beginning with position 1. This means that two Channel Adapters must be installed in the 3725 before any may be installed in the 3726. A Two-Processor Switch will always be installed in the first available position.

Transmission Subsystem (TSS): The Transmission Subsystem consists of Line Attachment Bases (LABs), Line Interface Couplers and Internal Clock Controls. Four types of LABs are available: LABs Type A, LABs Type B, LABs Type C and CLABs. LABs Type A and CLABs provide one communication scanner and LABs Type B provide two communication scanners. LABs Type C provide one communication scanner and interface clock control and one Token-Ring Multiplexer. Two CLABs are included in the base machine. They are not provided as optional features. Optionally an additional LAB of either Type A or B or C may be installed in the 3725.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode; i.e., in a mode of operation similar to

Do not reproduce without written permission

the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 to 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NCP V2; i.e., in a mode of operation similar to the one of Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3 or V4. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64K bps with EP/3725 R2. In addition, the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3725 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet, switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to 4 LICs can be installed on a Line and Token-Ring Attachment Base (LAB Type C) for a maximum of 16 lines per LAB Type C. Up to 8 LICs can be installed on LABs Type A or B and CLABs for a maximum of 32 lines per Lab.

Each LIC is assigned a scanner "weight", which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on a scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the "3725 Configuration Guide", SA33-0012, for detailed explanations of the configuration rules used on the TSS.

Internal Clock Control features are required to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly attached synchronous terminals.

Direct Attachment: The 3725 allows direct, i.e., modemless, attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 245K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 56K bps.

Directly-attached DTEs require the ICC feature in the 3725. At speeds of up to 1200 bps, the speed is set at the time of control program generation and must match that of the DTEs internal clock. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3725) and the speed is set by hardware in the 3725. At the plant, the speed will be set to 9600 bps. At installation time, it may be changed by the CE on a per-LIC basis to 2400, 4800, 19.2K or 56K, or 245K bps. See ICC-2 (#4667) for details.

For information on the available direct attachment cable types and lengths, refer to the "Installation Manual-Physical Planning", GC22-7064.

Token-Ring Subsystem (TRSS): It allows 3725 to attach to IBM Token-Ring Networks. It consists of Line and Token-Ring Attachment Bases (LABs), Token-Ring Interface Couplers (TICs). One type of LAB is available: Lab Type C provides one Token-Ring Multiplexer (TRM) and up to four Token-Ring Interface Couplers (TICs). In addition LAB Type C provides one communication scanner and internal clock control and up to four LICs (refer to TSS section).

The TRM provides adaptation between the 3725 and the TICs.

The Token-Ring Interface Coupler Type 1 (TIC) is a set of components and a micro-processor running under control of a resident

microcode which controls the IBM Token-Ring Network using standard protocols. The TIC operates under control of the Network Control Program (NCP) only.

Performance: The maximum number of LICs or TICs capable of concurrent operation is a function of line speed, line protocols, the 3725 control program, traffic, and application work load. The number of LICs and TICs which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

Bibliography: GC20-0001

SPECIFY

The voltage, nomenclature and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3725, if the default options specified below are satisfactory.

- Power (AC, 1-phase, 3-wire):

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

- Color: The standard color is pearl white. (Except Canada>The standard color is blue.<) For other colors, specify #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue (Except Canada>, #9064 for charcoal brown, #9065 for (<) pebble gray (Canada only>, #9066 for pearl white.<)

- Machine Nomenclature: Default is English US.

Canadian French	#2935
English US	#2924
Japanese	#2930
Portuguese	#2933
Spanish	#2931

National safety regulations require maintenance labels in local language. The language is determined by default from the 3-digit country code in the machine order. If the installation country is different from the order country, specify #2900, which provides sets of labels in other languages. The CE selects and installs the appropriate one.

Specify #9710 every time an expansion frame 3726 is ordered with a LAB Type C (#4774) or an MES for a LAB Type C (#4774) is ordered for a 3726. Specify #9710 will trigger the shipment of EC 342076 if not already installed on 3725-1.

SPECIAL FEATURES

Non-Communications Features

Storage Increment 256K (#7100): Provides main storage increments of 256K bytes to allow up to three megabytes of memory. Maximum: Ten per 3725. Prerequisites: For over two megabytes (7th #7100), specify #9705 on initial order or on MES order if EC A20965 is installed; otherwise, order RPQ 8Q0455 Basic storage upgrade, and one RPQ 8Q0459 Storage increment upgrade for each of the first two storage increments (#7100) which will have been installed prior to the installation of this MES. Also, for over two megabytes (7th #7100), order #7101 3 Meg. storage capability. Field Installation: Yes.

3 Meg. Storage Capability (#7101): Provides 3 megabyte main storage capability. Field Installation: Yes.

RPQ 8Q0455 Basic Storage Upgrade: Provides upgrade of basic 512K storage on machines without EC A20965. Field Installation Only: Cannot be removed.

RPQ 8Q0459 Storage Increment Upgrade: Provides upgrade of one storage increment (1st or 2nd #7100) on machines without EC A20965. Field Installation Only: Cannot be removed. All storage increments (#7100) can be removed.

Two-Processor Switch (#8320): Provides a second channel interface to attach CA #1561 to a Multiprocessor System (MP) or to two channels of the same or different processors. One or both channel interfaces are enabled by a manual switch on the 3725 control panel. The enabled channel interface is operational when selected by the host channel. Data transfer cannot occur concurrently on both channel interfaces. Order channel cable groups #3920 and #1178 with this feature. Maximum: Two per 3725. Prerequisites: #1561 in the corresponding position. Field Installation: Yes.

Communications Features

Channel Adapter (#1561): Provides the logical and physical interface between a 3725 and a S/370 (except mdls 115 and 125), 303X, 308X, 43XX, 9370 processor. It attaches to a byte multiplexer, block multiplexer or selector channel. Each one may be equipped with a Two-Processor Switch (TPS). With this feature, order channel cable groups #3920 and, if required, #1178. Maximum: Two per 3725. The possible combinations of CAs and TPSs are:

Number of CAs	CA Position	TPS Position
0	-	-
1	1	1
2	1,2	1,2

Prerequisites: None. Field Installation: Yes.

Internal Clock Control (#4666): (Not available after July 1, 1985. Replaced by ICC-2, feature code #4667.) Provides bit clocking when the attached external DCE does not provide this clocking, or when direct attachment of the DTE is required. It provides clocking for eight LICs (up to 32 lines) at 50, 110, 134.5, 200, 300, 600 and 1200 bps for operation with or without a DCE and at speeds of 2400, 4800, 9600, 19K and 56K bps for operation without a DCE (direct attachment). At speeds up to 1200 bps, the speed is set at the time of control program generation and must match that of the internal clock of the attached DTE. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3725) and the speed is set by hardware in the 3725. At the plant, the speed will be set to 9600 bps. At installation time, it may be changed by the CE on a per LIC basis to 2400, 4800, 19K or 56K bps. Maximum: Two per base machine plus one per LAB Type A or Type B. Field Installation: Yes.

Internal Clock Control Type 2 (#4667): For internally clocked DTEs, the ICC-2 provides business machine clocking to the 3725, at data rates of 50, 110, 134.5, 200, 300, 600, and 1200 bps for asynchronous (S/S) or synchronous (BSC or SDLC) operation with or without a DCE (direct attachment). It also provides business machine clocking to the 3725, at data rates of 75, 100, 2400, 4800, 9600, and 19.2K bps for asynchronous (S/S) operation with or without a DCE (direct attachment). The speed of the ICC-2 is set, for each DTE, at generation time of the control program and must match that of the internal clock of the attached DTE.

For externally clocked DTEs, it provides bit clocking to directly attached DTE at data rates of 2400, 4800, 9600, 19.2K, 56K, and 245K bps for synchronous (BSC or SDLC) operation without a DCE and at a data rate of 2400, 4800, 9600, and 19.2K bps for start/stop operation without a DCE. The selected speed is set by hardware in the 3725. At the plant, the speed is set to 9600 bps and at installation time, it may be changed by the CE on a per LIC basis. Maximum: Two per base machine plus one per LAB Type A (#4771) or Type B (#4772). Field Installation: Yes.

Line Attachment Base Type A (#4771): Provides a communication scanner and a physical base for up to eight LICs Type 1 (#4911) or Type 4A (#4941). Limitations: The sum of LIC weights must not ex-

ceed 100. Except by MES, only LICs with weight 12 or 18 may be installed on the LAB Type A. Exclusive with LAB Type B (#4772) or with LAB Type C (#4774). Maximum: One per 3725. Prerequisites: Specify #9671 only to order a LAB Type A without any associated LIC. Field Installation: Yes.

Line Attachment Base Type B (#4772): Provides two communication scanners and a physical base for up to eight LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942). Each scanner controls up to four LICs. Limitations: The sum of the four LIC weights attached to one communication scanner must not exceed 100. Exclusive with LAB Type A (#4771) or with LAB Type C (#4774). Maximum: One per 3725. Prerequisites: Specify #9672 only to order a LAB Type B without any associated LIC. Field Installation: Yes.

Token-Ring and Line Attachment Base Type C (#4774): Lab Type C provides a communication scanner, a Token-Ring Multiplexer, an internal clock control, a physical base for up to four LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942), and for up to four Token-Ring Interface Couplers (#4991). Limitations: The sum of the four LIC weights attached to the scanner must not exceed 100. Exclusive with LAB Type A (#4771) or LAB Type B (#4772). Maximum: One per 3725. Prerequisites: Use ordering procedures of specified configurations Specify Code #6000. Specify #9674 only to order a LAB Type C without any associated LIC and TIC. For MES use Specify Code #6000 if it is not already on the machine history. Field Installation: Yes.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs and of start stop DTEs up to 19.2K bps if it is associated with an ICC. The DTEs attached directly to a given LIC must operate at the same speed.

LIC 1 provides modem attachment of asynchronous devices (not clocked by the DCE) at speeds up to 19.2K bps, if it is associated with an ICC. The asynchronous DTEs using DCE clocking can also be attached at speeds above 1200 bps and up to 19.2K bps, without associated ICC.

Depending on the options chosen at the generation of the control program, each port of LIC Type 1 can support one of the following interfaces:

Duplex or half-duplex EIA RS 232/CCITT V.24 at speeds up to 19.2K bps EIA RS-366/CCITT V.25 Autocall Equipment
X.21bis
X.20bis

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group #1404 for DCE attachment, or cable group #0081 for attachment to NTT DCEs, cable group #0082 for attachment to automatic calling units or cable group #0093 for attachment to NTT automatic calling units, cable group #0085 for V.24/RS-232-C direct attachment asynchronous, or cable group #1400 for V.24/RS-232-C direct attachment synchronous.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment: The LIC Type 1 (#4911) can support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35 meters (115 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35 meters (115 feet), the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier: A 3863 or 3864 or 3865 modem which does not have Data Multiplexer #3260 installed must have EC 344120 installed -- a 3865 modem with Data Multiplexer #3260 installed must have EC 323406 installed.

MACHINES

3. Order the cable: See "Ordering Procedures".

Limitations: If the transmission speed of any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is 5 at up to 14400 bps and 4 at up to 19200 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: 16 per basic 3725, plus eight additional per LAB Type A (#4771) or Type B (#4772). Prerequisites: LAB Type A (#4771) or Type B (#4772) in LAB position 3. An ICC on the same LAB, if direct attachment is required or if DCE does not provide clocking. Specify: LIC weights in accordance with Table 1. Field Installation: Yes.

* Weights and specify codes apply to most commonly used DTEs; i.e., those DTEs using transmission codes with at least 10 bits per character (start, data/parity, stop(s)), like ASCII. DTEs using transmission codes with less than 10 bits per character (start, data/parity, stop(s)), are also supported at speeds up to 600 bps.

** At 14400 and 19200 bps only two ports of the LIC 1 may be used.

*** Former weight 25 and #9105 remain available upon request.

**** Prerequisite #6000.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. Cables: For each LIC type 2 order one cable group #0086. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths. Limitations: When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per basic 3725, plus eight additional per LAB Type B (#4772) or four additional per LAB Type C (#4774). Prerequisites: LAB Type B (#4772) or LAB Type C (#4774) for LICs in LAB position 3. Specify: LIC weights in accordance with Table 2. Field Installation: Yes.

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, "BSC Char. Mode").

* Former weight 42 and specify code #9202 remain available upon request.

** Prerequisite #6000.

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 245K bps, if it is associated with an ICC. Cables: For each LIC Type 3, order one cable group #0087 for DCE attachment or cable group #0088 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per basic 3725, plus eight additional per LAB Type B (#4772) or four

additional per LAB Type C (#4774). Prerequisites: LAB Type B (#4772) or LAB Type C (#4774) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. Specify: LIC weights in accordance with Table 3. Field Installation: Yes.

	HDX	256000	100	#9303	#9323
	DX	256000			

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, BSC "Char. Mode").

* Former weight 42 and specify codes #9302 and #9322 remain available upon request.

** Prerequisite #6000.

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps, if it is associated with an ICC. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. Cables: For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group #0089 for DCE attachment or cable group #0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: 16 per basic 3725, plus eight additional per LAB Type A (#4771) or Type B (#4772). Prerequisites: LAB Type A (#4771) or Type B (#4772) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. Specify: LIC weights in accordance with Table 4A. Field Installation: Yes.

Table 4A: LIC Type 4A Weight Specify Codes

	DX	4800			
	DX	9600	25	#9402	#9422

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 256K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 256K bps. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 245K bps, if it is associated with an ICC. Cables: For each LIC Type 4B, order one cable group #0089 for DCE attachment or one cable group

#0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per basic 3725, plus eight additional per LAB Type B (#4772) or four additional per LAB Type C (#4774). Prerequisites: LAB Type B (#4772) or LAB Type C (#4774) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. Specify: LIC weights in accordance with Table 4B. Field Installation: Yes.

Table 4B: LIC Type 4B Weight Specify Codes

Line		Trans Speed (bps)	LIC Wei-	-Specify No ICC	Code- ICC

	HDX	128000	50**	#9406	N/A
	DX	128000			

* Former weight 42 and specify codes #9404 and #9424 remain available upon request.

** Prerequisite #6000.

Token-Ring Interface Coupler Type 1 (TIC) (#4991): Provides one attachment to IBM Token-Ring Network. Cables: For each TIC, order one cable group #1666. When a 3725 is to be installed in an IBM Token-Ring Network where IBM Cabling System Type 3 Specified Media (telephone twisted pair) is used, a Data Grade Media to Type 3 Filter is required between the 3725 TIC cable and the telephone twisted pair wiring. Refer to IBM Token-Ring Network Twisted Pair Media Guide (GA27-3714). Refer to the "Installation Manual-Physical Planning", GC22-7064 for information on available cable lengths. Maximum: Four. Prerequisites: LAB Type C (#4774). Field Installation: Yes.

Configuring and Ordering Procedures of Specified Configurations:

General:

- It is possible to configure a 3725 without following all the rules described in the "IBM 3725 Communication Controller Configuration Guide", (Chapter "Graphic Configuration Procedure").
- This configuring procedure allows flexibility in placing Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match to match very specific configuration requirements.
- Such configurations are called: "Specified Configurations" and should be ordered with Specify Code #6000.
- Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory configuring rules.
- For configuring information, refer to the "IBM 3725 Communication Controller Configuration Guide", appendix "Configuring and ordering specified configurations", and to the HONE Configurator CF3725.

Ordering Procedure:

- Use CF3725 to configure the 3725 to the customer's requirement.
- Enter the order directly into Specify Code #6000 is required.

MACHINES

- Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.
- Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department".

- Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3725 COMMUNICATION CONTROLLER MODEL 2

PURPOSE

The 3725 model 2 controls data communications between modem-attached or directly-attached (without a modem) or IBM Token-Ring Network attached terminal devices and one or more directly- or remotely-connected S/370 (except models 115 and 125), 303X, 308X, 3090, 43XX, 9370 host processors, or between two host processors. Remote connection may be via PTT -provided or customer-owned communication facilities. A 3727 console is required for installation, operation and maintenance.

The following is a brief summary of the 3725 Communication Controllers.

Comm. Cont.	Max Lines*	Max Strg.	Host Program	Comm. Cont. Program
3725-1	256	3M	VTAM/TCAM	ACF/NCP-PEP
	256	1M	BTAM	EP
3725-2	80	3M	VTAM/TCAM	ACF/NCP-PEP
	80	1M	BTAM	EP

* Maximum lines that can physically attach, CF3725 is required to predict actual line attachment capabilities

See individual pages for each Communication Controller for information on additional features.

MODEL 2

Model 2 002

Prerequisites: If channel-attached, the 3725 mdl 2 requires a control unit position on a system channel. See processor pages for details.

When attaching to a 4321 or 4331 in EP mode, restrictions are imposed on the number of available subchannels which may be used by the 3725 mdl 2. On the 9370 processors, EP and PEP modes are not supported.

HIGHLIGHTS

The 3725 mdl 2 is a modular, programmable communication controller, which runs under the control of:

- Either ACF/NCP Version 2 for the 3725 or EP/3725 R1 or both in PEP mode.
- Or ACF/NCP Version 3 or Version 4 or EP/3725 R2 or both in PEP mode. (See Program Products and SCP sections for details.)

Its programmability allows a high degree of flexibility in tailoring a data communications system to the customer's requirements. In addition, it plays an active role in Communications Network Management (CNM) by providing data to the Network Communications Control Facility (NCCF) and the Network Problem Determination Application (NPDA).

The machine structure is simplified by having a small number of features: Five types of line interfaces one storage feature, one type of communication scanner and one type of channel adapter. This allows easy additions and changes to the machine configuration.

The 3725 mdl 2 is field upgradable to 3725 mdl 1.

Characteristics of the 3725 mdl 2 include:

- LSI technology for good RAS characteristics and low power consumption.
- The same internal performance as the 3725 mdl 1.

- Attachment of high-speed lines which use the modulo 128 function of ACF/NCP for INN and BNN links.
- 512K bytes to 3M bytes of main storage by steps of 256K bytes.
- Internal Clock Control included in the base machine and optional in the second and third Line Attachment Base.
- Maintenance and Operator Subsystem (MOSS), a functionally separate processor, facilitates maintenance and problem determination by providing:

- Box error logging
- Alert mechanisms
- Display of machine status
- Diagnostics for the Central Control Unit (CCU), channel adapters, scanners and line interfaces
- Utilities to:
 - ▲ collect microcode dumps and send them to the host for printing
 - ▲ provide actual configuration data, help the customer to plan for MES, and store this information on the MOSS diskette via the Graphic Configuration File for further console display or update. This information can be transferred to the host where the machine diagram can be printed by ACF/SSP
 - ▲ allow the operator to keep a current Line Description File, providing the physical address, symbolic name, speed, and protocol of each connected line. This file, stored on the MOSS diskette, may be transferred to the host and printed by ACF/SSP.

- Same RAS Characteristics as the 3725 mdl 1:

- Reliability and availability of the 3725 are enhanced by the following elements:
 - ▲ Extensive error detection, including storage protection against inadvertent overlays
 - ▲ Functional building block design (most adapter errors are contained within a single building block and thus will not take the system down)
 - ▲ Error correcting code for the main storage and scanner storage
 - ▲ Error by-pass facilities: Microcode re-IPLs, system re-IPLs and dynamic reconfiguration of SNA resources
 - ▲ Automatic first-level problem determination with alert messages, which report hardware errors to the network operator and recommend actions
 - ▲ Enhanced problem determination aids
 - ▲ Automatic power-on when power returns after loss
 - ▲ Port Swapping which allows the operator to logically swap a line from a failing port to a spare port without involvement of the host processor.

- Same serviceability as the 3725 mdl 1, including:

- ▲ Many host-independent functions for installation and maintenance
- ▲ Error information logging/retrieval
- ▲ Diagnostics and trouble shooting facilities
- ▲ Concurrent maintenance for MOSS diskette drive and console.

- Same Network Management and Problem Determination as the 3725 mdl 1: Considerable function has been designed into this communication controller to provide maximum availability to the customer. The 3725 MOSS provides problem determination and recovery procedures that are designed to be easily understood and used by the operator e.g.:

- Stand Alone Link Test facility to test an SDLC Communication link attaching another 3725 or 3705, without involvement of a host or a control program.

MACHINES

- Line Interface Display to monitor at the console the status of most of the control leads on a line interface.

The 3725 supports IBM's CNM (Communications Network Management) direction by sending error related information to the Network Problem Determination Application (NPDA) running in a host processor under the support of the Network Communications Control Facility (NCCF). This enhanced CNM support provides better problem determination in SNA networks. The basic NCP problem determination functions (alerts) are also offered in the non-NPDA environment, but they are not available in EP mode.

- Attachment of up to 80 duplex or half-duplex lines to the 3725 mdl 2. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.

Attachment of up to four separate IBM Token-Ring Networks to the 3725 mdl 2.

- Zero or four channel adapters in the 3725 mdl 2 to connect to the byte multiplexer, block multiplexer or selector channels of host processors.
- Configuration Aids: The HONE Configurator CF3725 and the "Configuration Guide", SA33-0022, are available to IBM representatives to assist in configuring a 3725 mdl 2 to specific network requirements. The CF3725 configurator provides configurations with feature and specify codes, cable lists as well as storage and performance estimates. In CF3725 and in these pages a number of sample configurations are also available for guidance.

Sample Configurations: To ease the task of configuring and ordering a 3725 mdl 2, several sample configurations representing popular combinations of lines have been defined here and in CF3725 response files.

Presentation of the sample configurations C1 to C7:

The first column of each table describes the different categories of lines by groups of protocols. Then, each configuration CONF1 to CONF7 provides a combination of those lines and the related feature/specify codes to be ordered.

1. Excluding character mode (See Table 1: LIC Type 1).
2. Not supported with control program level prior to ACF/NCP V3 and EP/3725 R2 (See Table 1: LIC Type 1).

Note: For each of these sample configurations you must also order:

- The 3725 mdl 2 base machine (select voltage, machine nomenclature, and color from "Specify").
- As many #1561s (channel adapters) as are needed (maximum 4).
- One 3727 Operator Console (separate order).

Machine Organization: The 3725 mdl 2 contains:

Central Control Unit: Executes instructions to control the communication scanner and the channel adapters. The CCU runs under the control of ACF/NCP, EP/3725 or both in PEP mode.

Main Storage: Houses a control program (NCP, EP, PEP) and other program products loaded from the host processor and provides buffers for the data exchanged with the channel adapters and the lines. The base machine includes 512K bytes of storage. The main storage is expandable up to 3M bytes by steps of 256K bytes.

Maintenance and Operator Subsystem (MOSS): Provides IPL and utility procedures for the 3725 mdl 2 operator. It includes an independent processor with its microcode, a diskette drive and an attachment for the operator console.

Transmission Subsystem (TSS): Provides the physical connection to communication facilities. It consists of Line Attachment Bases (LABs) with a microprocessor based scanner, Line Interface Couplers (LICs), and Internal Clock Control (ICC-2).

The 3725 mdl 2 may also contain:

Channel Adapters (CAs): Provide physical connection to host channels. The base machine provides a physical base for two Channel Adapters.

Line Interface Couplers (LICs): Provide interfaces to communication lines. The base machine provides a physical base for up to six LICs.

Internal Clock Control (ICC-2): Requires to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly attached synchronous terminals.

The 3725 mdl 2 does not attach the 3726.

Token-Ring Subsystem (TRSS): Provides the physical connection to IBM Token-Ring Network. It consists of Line and Token-Ring Attachments (LABs) with Token-Ring Multiplexer and Token-Ring Interface Coupler (TICs).

Console: The 3725 mdl 2 requires a primary 3727 Operator Console for installation, operation and maintenance; see M3727 pages for details. A second 3727 Operator Console may be used as an alternate operator console. The operator consoles are directly attached, i.e., no DCEs (modems) are required. Only one operator console is active at a given time. The active console is selected by a switch on the 3725 mdl 2 control panel. See "Service Requirements" for additional information.

Customer Responsibilities: See M2700 pages. Also see EP and NCP Programming pages for attachment capability.

Communications Facilities: The 3725 mdl 2 operates over PTT-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Remote Communication Controller: The 3725 mdl 2 can be used without channel connection to a host processor. Such a 3725 mdl 2 is termed 'link-attached' and is connected via one or more communication links to channel-attached 3705s, 3725 mdl 1s and/or 3725 mdl 2s. A link-attached controller has the same networking capabilities as a channel-attached one. Link attachment is a standard capability of the 3725 mdl 2; no special feature is needed. For more information on the functions of a link-attached Communication Controller, see the Advanced Communications Functions for NCP (ACF/NCP) in the Program Products section.

Service Requirements: The 3725 mdl 2 requires a local (primary) 3727 Operator Console as the console for operation, as well as for installation and maintenance. Maximum distance is 7.5m (25 ft). The 7427 Console Switching Unit (Special Product provided by RPQ 8J5008) offers the capability to allow up to four 3725 mdl 2 and/or 3725 mdl 1 machines to share a single primary operator console.

Service limitations are: A primary console is required for maintenance and must be available whenever service is to be performed. There must be no obstructing wall or door between the primary console and any attached 3725 mdl 2. The primary console must be available for maintenance personnel when called for servicing a 3725 mdl 2.

Data Communication Equipment

Modems: The following IBM modems or units may be used with the 3725 mdl 2:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1/2	2400/1200	Nonswitched or switched voice grade
3864-1/2	4800/2400	Nonswitched or switched voice grade
3865-1/2	9600/4800	Nonswitched voice grade
3868-1	2400/1200	Nonswitched voice grade
3868-2	4800/2400	Nonswitched voice grade
3868-3/4	9600/4800	Nonswitched voice grade
3872-1	2400/1200	Nonswitched or switched voice grade
5811-10	2400/4800/9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400/4800/7200/9600	Nonswitched baseband
5811-28		Rack mount version of 5811-20
5812-10	2400/4800/7200/9600	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-2/3	9600/7200/4800	Nonswitched voice grade
5866-2/3	14400/9600	Nonswitched voice grade
5868-52		Rack mount version of 5865-2
5868-62		Rack mount version of 5866-1/2

Note: 4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

PTT Mandatory DCEs: The 3725 mdl 2 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.24, V.28, ISO Standard 2110 and the relevant CCITT Recommendations for data transmission speed. The 3725 mdl 2 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.35 and ISO Standard 2593.

Public Data Networks: Public Data Networks are attached as listed in the charts of the M2700 pages.

Non-IBM DCEs: Non-IBM DCEs complying with EIA RS-232-C, CCITT Recommendations V.24/V.28, V.35 or X.21 may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.

Automatic Calling Equipment: The 3725 mdl 2 attaches the PTT mandatory autocal equipment complying with CCITT Recommendation V.25 and ISO Standard 2110.

OEM automatic calling equipment which comply with EIA RS-366 or CCITT Recommendation V.25 may be attached under the provisions of the IBM Multiple Supplier Systems Policy.

Configuring and Ordering Procedures:

- For a new machine:: A new machine must be configured with the aid of the HONE Configurator CF3725 or the "Configuration Guide", SA33-0022, unless one of the sample configurations is ordered. Either procedure yields a list of feature codes and specify codes, which is used to order the machine, and a pictorial diagram showing the positions of the LICs. A copy of this diagram should be given to the customer, as it will be needed when the NCP or EP is generated. At order confirmation time, the machine configuration must be verified by the configurator CF3725. A copy of the CF3725 output must be given to CE, as it will be needed to order and install the DCE and other communication cables. Approximately 30 days before the machine is to be shipped, the plant will send a similar pictorial diagram to the branch office. It will include two more copies of this diagram with the machine documentation. One of these should be given to the customer, the other to CE.

A similar pictorial diagram, called the Graphic Configuration File, is stored on the MOSS diskette. Most of this file is generated by the 3725 mdl 2, but the customer is responsible for adding the LIC weights (see "Transmission Subsystem" for description of LIC weights) and for keeping them up to date when line protocols or speeds are changed. This information is required for subsequent MES orders.

A 3727 console must be ordered for each 3725 mdl 2, unless the 3725 mdl 2 is to share a console via the 7427 Console Switching Unit (RPQ 8J5008).

- For an MES:

From the Graphic Configuration file stored on the MOSS diskette, a diagram of the actual machine configuration is obtained on the host printer. The HONE Configurator CF3725 or the Configuration Guide and this diagram of the machine may be used to configure the MES. This procedure yields a list of feature codes and specify codes (including LIC weights), which is used to order the MES, and an updated pictorial diagram of the LICs. A copy of the updated configuration on the Graphic Configuration printout marked with the MES order number must be sent by the marketing representative to the servicing branch office for use by the CE detailing plugging information for installation planning purposes. This updated configuration is required by the CE as it provides the only source of internal machine feature location and plugging information for the LICs.

To assist the customer and CE, the MES number for the ordered LICs, as well as the LIC types and weights, should be entered in the Graphic Configuration File when the MES is ordered. After installation of the MES, the CE verifies that the LICs and their weights in the Graphic Configuration File are consistent with the installation.

If LIC weight specify codes are not specified or if their combined weight exceeds standard initial order limits, then the Specify Code #6000 must be specified unless it is already on the machine history.

To relocate Line Interface Couplers (LICs) or Internal Clock Control (ICC) within the same frame of a leased machine or to change the speed setting of an Internal Clock Control submit a Record-Purpose-Only MES order with specify #5000.

To relocate Line Interface Couplers (LICs) or Internal Clock Control (ICC) from one leased machine to another leased machine, concurrently submit a MES order for each machine and specify #5000 on any order which contains reinstallation to avoid shipment of new material. CE will perform the service as per request from their sales office and by guidance from MES installation instruction in the Machine Installation Manual (MIM) Vol A03 Chapter 8 for instructions. Because specify code #5000 causes all LICs and ICCs on an order to be shipped as documents only, any feature additions should be ordered on a separate order.

Relocation of Channel and Line Attachment Base, Line Attachment Base, Channel adapters, or Storage Increment are not possible. On purchased machines, use RPQs for LIC or

ICC relocation on the same machine, for LIC or ICC reinstallation on another machine, or for change of speed of an ICC.

- For cables:

External cables, except the cable for the primary console, are ordered via WTAAS or cable order form. Cables for the 3726 Communication Controller Expansion must be ordered with the 3726. (Canada, Latin America, Taiwan > IBM supplies LIC cables and alternate console cable at standard length, 13.5m (45 ft) long, except for direct attached DTEs on LIC4A, LIC4B where the standard length is 30m (100 ft): order the corresponding cable group as defined in the IMPP. IBM supplies TIC cables at standard length 23m (75 ft): order the corresponding cable group as defined in the IMPP. For shorter cables, or for the alternate operator console cable up to 20m (64 ft) long or for channel cables, order the corresponding cable group at the specified length as defined in the IMPP. For longer cables, order cables by P/Ns, which are listed in the IM-PP (GC22-7064), at the specified length on (<) (Except Canada > an MES. <) (Canada only > a cable order Form 2642. <) These cables include installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the (Except Canada > QSLM file <) (Canada only > FED parts price list <) for prices. (except Canada, Latin America, Taiwan > Order all cables by cable group number as shown under "3725/3726 Custom Length Cables" in the IMPP and as listed in the following table:

Regular Order

Rel. Cable Feat. Code	Grp. #	Max. Length m. (ft)	Purpose
1561 (CA) or 8320 (TPS)	3920 62.0 (200) 1178 45.0 (150)		CHANNEL Power Control
4911 (LIC1)	0081 13.5 (45) 0093 13.5 (45) 0683 13.5 (45)		V.24 DCE,NTT V.25 ACU,NTT V.24 Dir.Att.
ASYN	0690 13.5 (45)		V.24 Dir.Att.
SYN	0691 10.6 (35) 0684 10.6 (35)		V.24 DCE Wideband Modem
4921 (LIC2)	0685 10.6 (35) 0686 13.5 (45)		V.35 DCE V.35 Dir.Att.
4941 (LIC4A)	0687 13.5 (45) 0688 30.0 (100)		X.21 DCE X.21 Dir.Att.
4942 (LIC4B)	0687 13.5 (45) 0688 30.0 (100)		X.21 DCE X.21 Dir.Att.
4991 (TICs)	1666 23 (75)		Token-Ring Att.
3727 Console	0689 20.0 (64)		Alt. Console<)

The primary operator console is installed with an attachment cable of 7.5m (25 ft) maximum, which is included in the shipping group of the 3725 mdl 2. For the Alternate Operator Console, IBM supplies a cable of up to 20m (65 ft). This cable is obtained by ordering cable group #0099. Additional length up to 150m (490 ft) may be ordered by RPQ.

Channel Adapters: The 3725 mdl 2 Channel Adapter attaches to a host channel to provide communications with S/370 (except mdls 115 and 125), 303X, 308X, 43XX, 9370 Processors.

Transmission Sub-System (TSS): Provides the physical connection to communication facilities. It consists of Line Attachment Bases

(LABs) with a microprocessor based scanner, Line Interface Couplers (LICs), and Internal Clock Control (ICC-2). Four types of LABs are available: Channel and Line Attachment Base (CLAB), LAB Type A, LAB Type B and Line and Line and Token-Ring Attachment Base (LAB Type C). One CLAB and one ICC-2 is included in the base machine, in option a second CLAB and one LAB Type A or Type B or Type C may be ordered for installation in LAB positions 2 and 3 respectively. The second CLAB provides a physical base for up to six LICs, two Channel Adapters, and one ICC-2. The LAB Type A or Type B provides a physical base for up to eight LICs and one ICC-2. The LAB Type C provides a physical base for up to four LICs and for up to four TICs and includes internal clock control. The second CLAB (#4773), the LAB Type A (#4771) or Type B (#4772), or Type C (#4774), the ICC-2 (#4667) in the second CLAB and in the LAB Type A or B, and the LICs are optional features.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 mdl 2 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode, i.e., in a mode of operation similar to the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 to 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NCP V2, i.e. in a mode of operation similar to the one of the Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3 or V4. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64K bps with EP/3725 R2, for tributary addressing under EP or PEP. In addition the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3725 mdl 2 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to six LICs on each CLAB and up to eight LICs on the LAB type A or B can be installed in the 3725 mdl 2 to provide a maximum of 80 lines and up to four LICs can be installed on a Line and Token-Ring Attachment Base (LAB Type C) for a maximum of 64 lines per 3725-2.

Each LIC is assigned a scanner 'weight', which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on the scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the "Configuration Guide", SA33-0022, available to IBM representatives, for detailed explanations of the configuration rules used for the TSS.

Internal Clock Control (ICC) is used to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly-attached synchronous terminals.

Direct Attachment: The 3725 mdl 2 allows direct, i.e., modemless, attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 245K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 245K bps.

Directly-attached DTEs use the ICC. See Internal Clock Control (#4667) for details.

For information on the available direct attachment cable types and lengths, refer to the "Installation Manual-Physical Planning Manual", GC22-7064.

Token-Ring Subsystem (TRSS): It allows 3725 to attach to IBM Token-Ring Networks. It consist of a Line and Token-Ring Attachment Base (LAB) and Token-Ring Interface Couplers (TICs). One type of LAB is available: LAB Type C provides one Token-Ring Multiplexer (TRM) and up to Four Token-Ring Interface Couplers (TICs). In addition LAB Type C provides one communication scanner and internal clock control and up to four LICs (refer to TSS section). The TRM provides adaptation between the 3725 and the TICs. The Token-Ring Interface Coupler (TIC) is a set of components and a micro-processor running under control of a resident microcode which controls the IBM Token-Ring Network using standard protocols. The TIC operates under control of the Network Control Program (NCP) only.

Performance: The maximum number of LICs or TICs capable of concurrent operation is a function of line speed, line protocols, the 3725 control program, traffic, and application work load. The number of LICs and TICs which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

Publications: GC20-0001

SPECIFY

The voltage, nomenclature and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3725 mdl 2, if the default options specified below are satisfactory.

- Power (AC, 1-phase, 3-wire):

50Hz	60Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

- Color: (Except Canada>The standard color is blue.<) For other colors, specify #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray, #9066 for pearl white (Canada only)

- Machine Nomenclature: Default is English US.

Canadian Fr.	#2935	Portuguese	#2933
English US	#2924	Spanish	#2931
Japanese	#2930		

National safety regulations require maintenance labels in local language. The language is determined by default from the 3-digit country code in the machine order. If the installation country is different from the order country specify #2900 which provides sets of labels in other languages. The CE selects and installs the appropriate one.

SPECIAL FEATURES

Non-Communications Features

Storage Increment 256K (#7100): Provides main storage increments of 256K bytes to allow up to three megabytes of memory. Maximum: Ten per 3725. Prerequisites: For over two megabytes (7th #7100), specify #9705 on initial order or on MES order if EC A20965 is installed; otherwise, order RPQ 8Q0455 Basic storage upgrade, and one RPQ 8Q0459 Storage increment upgrade for each of the first two storage increments (#7100) which will have been installed prior to the installation of this MES. Also, for over two megabytes (7th

#7100), order #7101 3 Meg. storage capability. Field Installation: Yes.

3 Meg. Storage Capability (#7101): Provides 3 megabyte main storage capability. Field Installation: Yes.

RPQ 8Q0455 Basic Storage Upgrade: Provides upgrade of basic 512K storage on machines without EC A20965. Field Installation Only. Cannot be removed.

RPQ 8Q0459 Storage Increment Upgrade: Provides upgrade of one storage increment (1st or 2nd #7100) on machines without EC A20965. Field Installation Only. Cannot be removed. All storage increments (#7100) can be removed.

Communications Features

Channel Adapter (#1561): Provides the logical and physical interface between a 3725 mdl 2 and a S/370 (except mdls 115 and 125), 303X, 308X, 4300 processor. It attaches to a byte multiplexer, block multiplexer or selector channel. With this feature, order channel cable group #3920 and, if required, #1178. Maximum: Four per 3725 mdl 2. Prerequisites: A CLAB (#4773) must be installed in position 2 to attach the third and fourth Channel Adapters. Field Installation: Yes.

Internal Clock Control Type 2 (#4667): For internally clocked DTEs, the ICC-2 provides business machine clocking to the 3725, at data rates of 50, 110, 134.5 200, 300, 600, 1200 bps, for asynchronous (S/S) or synchronous (BSC) operation with or without a DCE (direct attachment). It also provides business machine clocking to the 3725, at data rates of 75, 100, 2400, 4800, 9600, and 19.2K bps for asynchronous (S/S) operation with or without a DCE. The speed of the ICC-2 is set, for each DTE, at generation time of the control program and must match that of the internal clock of the attached DTE.

For externally clocked DTEs, it provides bit clocking to a directly attached DTE at data rates of 2400, 4800, 9600, 19.2K, 56K, and 245K bps for synchronous (BSC or SDLC) operation without a DCE and at a data rate of 2400, 4800, 9600, and 19.2K bps for start/stop operation without a DCE. The selection speed is set by hardware in the 3725. At the plant the speed is set to 9600 bps and at installation time it may be changed by the CE on a per LIC basis. Maximum: One in second CLAB (#4773) and one in the LAB Type A (#4771) or Type B (#4772). Field Installation: Yes.

Channel and Line Attachment Base (#4773): Provides one communication scanner (ICC-2) and a physical base to optionally attach one Internal Clock Control Type 2 (#4667), up to 2 Channel Adapters (#1561), and up to six LICs. Limitations: The sum of the LIC weight must not exceed 100. The CLAB can only be installed in position two. Maximum: One per 3725. Prerequisite: Specify #9673 only to order a CLAB without any associated LIC. Field Installation: Yes.

Line Attachment Base Type A (#4771): Provides one communication scanner and a physical base to optionally attach one Internal Clock Control Type 2 (#4667) and up to eight LICs. Limitations: The sum of the LIC weight must not exceed 100. The LAB Type A can only be installed in the position 3 and is exclusive with the LAB Type B (#4772) or with the LAB Type C (#4774). Maximum: One per 3725. Prerequisites: A CLAB (#4773) should be installed in position 2. Specify #9671 only to order a LAB Type A without any associated LIC. Field Installation: Yes.

Line Attachment Base Type B (#4772): Provides two communication scanners and a physical base to optionally attach one Internal Clock Control Type 2 (#4667) and up to eight LICs. Limitations: The sum of the LIC weight must not exceed 100. The LAB Type B can only be installed in the position 3 and is exclusive with the LAB Type A (#4771) or with the LAB Type C (#4774). Maximum: One per 3725. Prerequisites: A CLAB (#4773) should be installed in position 2. Specify #9672 only to order a LAB Type B without any associated LIC. Field Installation: Yes.

Line and Token-Ring Attachment Base Type C (#4774): LAB Type C provides a communication scanner, a token-ring multiplexer, an internal clock control, a physical base for up to four LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942), and for up to Four Token-Ring Interface Couplers (#4991).

Limitations: The sum of the four LIC weights attached to the scanner must not exceed 100. LAB Type C can only be installed in LAB position 3 and is exclusive with LAB Type A (#4771) or LAB Type B (#4772). Maximum: One per 3725. Prerequisites: A CLAB (#4773) must be installed in position 2. Use ordering procedures of specified configurations Specify Code #6000. Specify #9674 only to order a LAB Type C without any associated LIC and TIC. For MES use Specify Code #6000 if it is not already on the machine history. Field Installation: Yes.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs and of start stop DTEs at up to 19.2K bps, if it is associated with an ICC. The DTEs attached directly to a given LIC must operate at the same speed. Depending on the options chosen at the generation of the control program each port of LIC Type 1 can support one of the following interfaces:

- Duplex or half-duplex EIA RS-232/CCITT V.24 at speeds up to 19.2K bps
- EIA RS-366/CCITT V.25 Autocall Equipment
- X.21bis switched or nonswitched
- X.20bis switched or nonswitched

LIC 1 provides modem attachment of asynchronous devices (not checked by the DCE) at a speed up to 19.2K bps, if it is associated with an ICC-2. The asynchronous DTEs using DCE clocking can also be attached at speeds above 1200 bps and up to 19.2K bps, without an associated ICC-2.

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group #1404 for DCE attachment or cable group #0081 for attachment to NTT DCEs cable group #0082 for attachment to automatic calling units or cable group #0093 for attachment to NTT automatic calling units cable group #0085 for V.24/RS-232-C direct attachment asynchronous or cable group #1400 for V.24/RS-232-C direct attachment, synchronous.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment: The LIC Type 1 (#4911) can support a cable length of up to 100m when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35m (115 ft) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35m (115 ft) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier, a 3863 or 3864 or 3865 modem which does not have Data Multiplexer #3260 installed must have EC 344120 installed. A 3865 modem with Data Multiplexer #3260 installed must have EC 323406 installed.
3. Order the cable: See "Ordering Procedure".

Limitations: If the transmission speed of any of the lines connected to the communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is 5 at up to 14400 bps and 4 at up to 19200 bps. Due to the sum of LIC weights the number of LICs may have to be further reduced. Maximum: Six in each of the CLAB plus 8 in the LAB Type A or B. Specify: LIC weights in accordance with Table 1. Field Installation: Yes.

Table 1: LIC Type 1 Weight Specify Codes

* Weights and specify codes apply to the most commonly used DTEs, i.e. those DTEs using transmission codes with at least 10 bits per character (start, data/parity, stop(s)), like ASCII. DTEs using transmission codes with less than 10 bits per character (start, data/parity, stop(s)), are also supported at speeds up to 600 bps.

** At 14400 and 19200 bps only two ports of the LIC 1 may be used.

*** Former weight 25 and #9105 remain available upon request.

**** Prerequisite #6000.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. Cables: For each LIC type 2, order one cable group #0086. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths. Limitations: When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Four in each of the CLAB plus 8 in the LAB Type B. Specify: LIC weights in accordance with Table 2. Field Installation: Yes.

DX	230400			

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, "BSC Char. Mode").

* Former weight 42 and specify code #9202 remain available upon request.

** Prerequisite #6000.

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modeless) attachment at up to 245K bps. Cables: For each LIC Type 3, order one cable group #0087 for DCE attachment or cable group #0088 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Four per basic 3725 mdl 2. Specify: LIC weights in accordance with Table 3. Field Installation: Yes.

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC Type 1 BSC "Char. Mode", in Table 1).

* Former weight 42 and specify codes #9302 and #9322 remain available upon request.

** Prerequisite #6000.

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operations are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modeless) attachment at 2400, 4800 or 9600 bps. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. Cables: For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group #0089 for

DCE attachment or cable group #0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Six in each of the CLAB plus 8 in the LAB Type A or B. Specify: LIC weights in accordance with Table 4A. Field Installation: Yes.

Table 4A: LIC Type 4A Weight Specify Codes

	DX	9600	25	#9402	#9422

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 256K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 256K bps. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 245K bps, if it is associated with an ICC. Cables: For each LIC Type 4B, order one cable group #0089 for DCE attachment or one cable group #0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs for that scanner is 4 at up to 72000 bps and 2 at up to 128000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Four in each of the CLAB plus 8 in the LAB Type B. Specify: LIC weights in accordance with Table 4B. Field Installation: Yes.

* Former weight 42 and specify codes #9404 and #9424 remain available upon request.

** Prerequisite #6000.

Token-Ring Interface Coupler Type 1 (TIC) (#4991): Provides one attachment to IBM Token-Ring Network. Cables: For each TIC, order one cable group #1666. When the 3725 is to be installed in an IBM Token-Ring Network where IBM Cabling System Type 3 Specified Media (telephone twisted pair) is used a Data Grade Media to Type 3 Filter is required between the 3725 TIC cable and the telephone twisted pair wiring. Refer to "IBM Token-Ring Network Twisted Pair Media Guide", GA27-3714. Refer to the "Installation Manual-Physical Planning", GC22-7064 for information on available cable lengths. Maximum: Four. Prerequisites: LAB Type C (#4774). Field Installation: Yes.

Configuring and Ordering Procedures of Specified Configurations:

- General:

- It is possible to configure a 3725 without following all the rules described in the "IBM 3725 Communication Controller Configuration Guide", (Chapter "Graphic Configuration Procedure").
- This configuring procedure allows flexibility in placing Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match to match very specific configuration requirements.
- Such configurations are called: "Specified Configurations" and should be ordered with Specify Code #6000.
- Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory mandatory configuring rules.
- For configuring information, refer to the "IBM 3725 Communication Controller Configuration Guide", appendix "Configuring and ordering specified configurations", and to the HONE Configurator CF3725.

● Ordering Procedure:

- Use CF3725 to configure the 3725 to the customer's requirement.
- Enter the order directly (Specify Code #8000 is required).
- Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.
- Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department"
- Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

MODEL CONVERSIONS

The following model conversion is field installable: 3725 mdl 2 to 3725 mdl 1. The features already installed in a 3725 mdl 2, except the second CLAB (#4773) and the third and fourth Channel Adapters (#1571) are automatically reinstalled in the 3725 mdl 1 during a model conversion.

The basic ICC will be removed from the 3725 mdl 2 purchased machine. To reinstall ICC, order RPQ 8Q0373.

When more than 2 Channel Adapters are installed in a 3725 mdl 2, the reinstallation of the third and fourth Channel Adapters is subject to RPQ.

For purchased machines, when the second CLAB (#4773) is installed in a 3725 mdl 2, order the RPQ 8J5103 to convert a 3725 mdl 2 to a mdl 1. Conversion time is 12 hours.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3726 COMMUNICATION CONTROLLER EXPANSION

PURPOSE

Provides additional line and/or IBM Token-Ring network and/or channel attachment capability to the 3725 Communication Controller mdl 1.

MODELS

Model 1 001

Prerequisites: If channel-attached, the 3726 requires a control unit position on a system channel. See processor pages.

HIGHLIGHTS

One 3726 Communication Controller Expansion only attaches to a 3725 Communication Controller mdl 1, which is required for its operation and maintenance. It expands the capability of the 3725 by providing physical attachment for up to four Channel Adapters without Two-Processor Switches or two Channel Adapters with Two-Processor Switches and up to five Line Attachment Bases supporting up to 160 lines or up to 128 lines and up to 8 IBM Token-Ring Networks.

The HONE Configurator CF3725 must be used to configure a 3726.

Communications Facilities: The 3726 operates over PTT-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Data Communication Equipment: The 3726 attaches the same DCEs as the 3725.

Ordering Procedures: See the M3725 pages.

Transmission Subsystem (TSS): The Transmission Subsystem consists of Line Attachment Bases (LABs), Line Interface Couplers and Internal Clock Controls. Three types of LABs are available: LABs Type A, LABs Type B and LABs Type C. LABs Type A provide one communication scanner and LABs Type B provide two communication scanners. LABs Type C provide one communication scanner and internal clock control, and one Token-Ring Multiplexer.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode, i.e., in a mode of operation similar to the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 to 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NPC V2, in a mode of operation similar to the one of Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3 or V4. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64K bps with EP/3725 R2. In addition, the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3726 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to 8 LICs can be installed on a Line Attachment

Base (LAB), for a maximum of 32 lines per LAB. Up to 4 LICs can be installed on a Line and Token-Ring Attachment Base Type C for a maximum of 16 lines per LAB Type C.

Each LIC is assigned a scanner "weight", which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on a scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the "Configuration Guide", SA33-0012, available to IBM representatives, for detailed explanations of the configuration rules used for the TSS.

Internal Clock Control features are required to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly-attached synchronous terminals.

Direct Attachment: The 3726 allows direct (i.e., modemless) attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols at speeds up to 19.2K bps or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 245K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 245K bps.

See ICC-2 (#4667) for details. For information on the available direct attachment cable types and lengths, refer to the "Installation Manual-Physical Planning", GC22-7064.

Token-Ring Subsystem (TRSS): It allows 3725 to attach to IBM Token-Ring Networks. It consists of Line and Token-Ring Attachment Bases (LABs) and Token-Ring Interface Couplers (TICs). One type of LAB is available: Lab Type C provides one Token-Ring Multiplexer (TRM) and up to four Token-Ring Interface Couplers. In addition LAB Type C provides one communication scanner, an internal clock control and up to four LICs (refer to "TSS" section). The TRM provides adaptation between the 3726 and the TICs. The Token-Ring Interface Coupler (TIC) is a set of components and a micro-processor running under control of a resident microcode which controls the Token-Ring Network using standard protocols. The TIC operates under control of the Network Control Program (NCP) only.

Performance: The maximum number of LICs or TICs capable of concurrent operation is a function of line speed, line protocols, the 3725 control program, traffic, and application work load. The number of LICs and TICs which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

SPECIFY

The voltage, nomenclature and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3726, if the default options specified below are satisfactory.

- Power (AC, 1-phase, 3-wire):

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

- Color: The standard color is pearl white (Except Canada > where it is blue <). For other colors, specify #9060

MACHINES

for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray(Canada only), #9066 for pearl white <).

- Machine Nomenclature: Default is English US.

Canadian French	#2935	Portuguese	#2933
English US	#2924	Spanish	#2931
Japanese	#2930		

National Safety regulations require maintenance labels in local language. The language is determined by default from the 3-digit country code in the machine order. If the installation country is different from the order country specify #2900 which provides sets of labels in other languages. The CE selects and installs the appropriate one.

SPECIAL FEATURES

Non-Communications Features

Line Increase Feature (#3602): Allows the installation of more than three LABs Type A (#4771) or Type B (#4772) in the 3726. It is required for LABs in positions 7 and 8 of the 3726. Maximum: One per 3726. Field Installation: Yes.

Two-Processor Switch (TPS) (#8320): Provides a second channel interface to attach CA #1561 to a Multiprocessor System (MP) or to two channels of the same or different processors. One or both channel interfaces are enabled by a manual switch on the 3725 control panel. The enabled channel interface is operational when selected by the host channel. Data transfer cannot occur concurrently on both channel interfaces. Order channel cable groups #3920 and #1178 with this feature. Each #8320 installed in the 3726 reduces the number of installable Channel Adapters in the 3726 by one. Maximum: Two per 3726. Prerequisites: #1561 in the corresponding position. Two TPSs must be installed in the attached 3725 before any TPS can be installed in the 3726. Field Installation: Yes.

Communications Features

Channel Adapter (CA) (#1561): Provides the logical and physical interface between a 3726 and a S/370 (except mdl 115 and 125), 303X, 308X, 43XX processor. It attaches to a byte multiplexer, block multiplexer or selector channel. Order channel cable groups #3920 and #1178 with this feature. Limitations: Each TPS installed in the 3726 reduces the number of installable CAs by one. Maximum: Four per 3726. The possible combinations of CAs and TPSs Switches are:

Number of CAs	CA Position	TPS Position
0	-	-
1	3	3
2	3, 4	3, 4
3	3, 4, 5	3
4	3, 4, 5, 6	-

Prerequisites: Two #1561s must be installed in the attached 3725 before any #1561 can be installed in the 3726. Field Installation: Yes.

Internal Clock Control (#4666): (Not available after July 1, 1985. Replace by ICC-2, feature code #4667.) Provides bit clocking when the attached external DCE does not provide this clocking, or when direct attachment of the DTE is required. It provides clocking for eight LICs (up to 32 lines) at 50, 110, 134.5, 200, 300, 600 and 1200 bps for operation with or without a DCE and at speeds of 2400, 4800, 9600, 19,200 and 56,000 bps for operation without a DCE (direct attachment). At speeds up to 1200 bps the speed is set at the time of control program generation and must match that of the internal clock of the attached DTE. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3726) and the speed is set by hardware in the 3726. At the plant the speed will be set to 9600 bps. At installation time it may be changed by the CE on a per LIC basis

to 2400, 4800, 19,200 or 56,000 bps. Maximum: One per LAB Type A or Type B. Field Installation: Yes.

Internal Clock Control Type 2 (#4667): For internally clocked DTEs, the ICC-2 provides business machine clocking to the 3725, at data rates of 50, 110, 134.5, 200, 300, 600, 1200, bps for asynchronous (S/S) or synchronous (BSC) operation with or without a DCE (direct attachment). It also provides business machine clocking to the 3725, at data rates of 75, 100, 2400, 4800, 9600, and 19.2K bps for asynchronous (S/S) operation with or without a DCE (direct attachment). The speed of the ICC-2 is set, for each DTE, at generation time of the control program and must match that of the internal clock of the attached DTE.

For externally clocked DTEs, it provides bit clocking to a directly attached DTE at data rates of 2400, 4800, 9600, 19.2K, 56K, and 245K bps for synchronous (BSC or SDLC) operation without a DCE and at a data rate of 2400, 4800, 9600, and 19.2K bps for start/stop operation without a DCE. The selected speed is set by hardware in the 3725. At the plant the speed is set to 9600 bps and at installation time, it may be changed by the CE on a per LIC basis. Maximum: One in second CLAB (#4773) and one in the LAB Type A (#4771) or Type B (#4772). Field Installation: Yes.

Line Attachment Base Type A (#4771): Provides a communication scanner and a physical base for up to eight LICs Type 1 (#4911) or Type 4A (#4941). Limitations: The sum of LIC weights must not exceed 100. Except by MES, only LICs with weight 12 or 18 may be installed on the LAB Type A. Maximum: Five per 3726, including LABs Type B (#4772) and LABs Type C (#4774). Prerequisites: #3602 for #4771 in position 7 of the 3726. A LAB Type A or B or C must be installed in position 3 of the attached 3725 before any LAB can be installed in the 3726. Specify #9671 only to order a Line Attachment Base Type A without any associated LIC. Field Installation: Yes. To order a LAB Type A in a 3726, select the appropriate Specify Codes as per the occupied position of the LAB Type A in the 3726. LABs are installed in the 3725 mdl 1 and in the 3726 according to the following placing sequence: first, all LAB Cs with LICs or TICs; second, empty LAB Cs; third, all LAB Bs with LICs; fourth, all empty LAB Bs; fifth, all LAB As with LICs; and last, all empty LAB As.

LAB Position	Specify Code
4	#8941
5	#8951
6	#8961
7	#8971
8	#8981

Line Attachment Base Type B (#4772): Provides two communication scanners and a physical base for up to eight LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942). Each scanner controls up to four LICs. Limitations: The sum of the four LIC weights attached to one communication scanner must not exceed 100. Exclusive with LAB Type A (#4771). Maximum: Five per 3726, including LAB Type A (#4771) and LAB Type C (#4774). Prerequisites: #3602 for #4772 in position 7 of the 3726. A LAB Type A or B or C must be installed in position 3 of the attached 3725 before any LAB can be installed in the 3726. Specify #9672 only to order a Line Attachment Base Type B without any associated LIC. Field Installation: Yes.

To order a LAB Type B in a 3726, select the appropriate Specify Codes as per the occupied position of the LAB Type B in the 3726. LABs are installed in the 3725 mdl 1 and in the 3726 according to the following placing sequence: first, all LAB Cs with LICs or TICs; second, empty LAB Cs; third, all LAB Bs with LICs; fourth, all empty LAB Bs; fifth, all LAB As with LICs; and last, all empty LAB As.

internal clock control, a physical base for up to four LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942) and for up to four Token-Ring Interface Couplers (#4991). Limitations: The sum of the four LIC weights attached to the scanner must not exceed 100. Maximum: One per 3726 if one already installed in 3725 mdl 1. Two per 3726 if none installed in 3725 mdl 1. Prerequisites: Use ordering procedures of specified configurations Specify Code #6000. #3602 for #4774 in position 3 of the 3726. A LAB Type A or B or C must be installed in position 3 of the attached 3725 before any LAB can be installed in the 3726. Specify #9674 only to order a LAB Type C without any associated LIC and TIC. For each LAB Type C in a 3726, order the specify code corresponding to its position in the 3726 (position 4 to 8) according to the following rule: LABs are installed in the 3725 mdl 1 and in the 3726 according to the following placing sequence: first, all LAB C with LICs or TICs; second, all empty LAB Cs; third, all LAB Bs with LICs; fourth, all empty LAB Bs; fifth, all LAB As with LICs; last, all empty LAB As. A different LAB placing sequence is allowed. For MES, use Specify code #6000 if it is not already in the machine history. No discontinuity in LAB placing sequence is allowed.

8	#8984

3726 order with a LAB Type C (#4774) or LAB Type C MES order to be installed on a 3726, will require a prerequisite MES order to add EC 342076 on the associated 3725. Use Specify Code #9710 to order EC 342076 on a 3725.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs at 2400, 4800, 9600 or 19.2K bps, if it is associated with an ICC. The synchronous DTEs attached directly to a given LIC must operate at the same speed. Lines connected via DCEs to this LIC may operate at a different speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400, 4800 or 19.2K bps in the field. Direct attachment of asynchronous devices is provided at speeds up to 19.2K bps. Depending on the options chosen at the generation of the control program, each port of LIC Type 1 can support one of the following interfaces:

Duplex or half-duplex EIA RS-232/CCITT V.24 at speeds up to 19.2K bps
EIA RS-366/CCITT V.25 Autocall Equipment
X.21bis
X.20bis

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group #1404 for DCE attachment, or cable group #0081 for attachment to NTT DCEs, cable group #0082 for attachment to automatic calling units or cable group #0093 for attachment to NTT automatic calling units, cable group #0085 for V.24/RS-232-C direct attachment asynchronous, or cable group #1400 for V.24/RS-232-C direct attachment synchronous.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment: The LIC Type 1 (#4911) can support a cable length of up to 100m when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35m (115 ft) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35m (115 ft) the following must be done:

- Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
- If the suffix is "DG" or earlier: A 3863 or 3864 or 3865 modem which does not have Data Multiplexer #3260 installed must

have EC 344120 installed -- a 3865 modem with Data Multiplexer #3260 installed must have EC 323406 installed.

- Order the cable: See "Ordering Procedure".

Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: If the transmission speed of any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is five at up to 14,400 bps and four at up to 19,200 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per LAB Type A (#4771) or Type B (#4772). Prerequisites: LAB Type A (#4771) or Type B (#4772). An ICC on the same LAB, if direct attachment is required or if DCE does not provide clocking. Specify: LIC weights in accordance with Table 1. Field Installation: Yes.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. Cables: For each LIC Type 2 order one cable group #0086. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths. Limitations: When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs for that scanner is four at up to 72,000 bps and two at up to 128,000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per LAB Type B (#4772) or four per LAB Type C (#4774). Prerequisites: #4772 or #4774. Specify: LIC weights in accordance with Table 2. Field Installation: Yes.

Table 2: LIC Type 2 Weight Specify Codes

	DX 230400		

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC1, "BSC Char. Mode").

* Former weight 42 and specify code #9202 remain available upon request.

** Prerequisite specify code #6000.

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 245K bps, if it is associated with an ICC. Cables: For each LIC Type 3, order one cable group #0087 for DCE attachment or cable group #0088 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs for that scanner is four at up to 72,000 bps and two at up to 128,000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per LAB Type B (#4772) or four per LAB Type C (#4774). Prerequisites: #4772 or #4774. An ICC on the same LAB, if direct attachment

is required. Specify: LIC weights in accordance with Table 3. Field Installation: Yes.

Table 3: LIC Type 3 Weight Specify Codes

Line Control	Trans-mission Speed (bps) LT/EQ	LIC Wt.	-Specify no ICC req'd	Code-ICC req'd

* Former weight 42 and specify codes #9302 and #9322 remain available upon request.

** Prerequisite specify code #6000.

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps, if it is associated with an ICC. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. Cables: For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group #0089 for DCE attachment or cable group #0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per LAB Type A (#4771) or Type B (#4772). An ICC on the same LAB, if direct attachment is required. Specify: LIC weights in accordance with Table 4A. Field Installation: Yes.

Table 4A: LIC Type 4A Weight Specify Codes

	DX 4800			
	DX 9600	25	#9402	#9422

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 256K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 256K bps.

The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 245K bps, if it is associated with an ICC. Cables: For each LIC Type 4B, order one cable group #0089 for DCE attachment or one cable group #0091 for direct attachment. Refer to the "Installation Manual-Physical Planning", GC22-7064, for information on available cable lengths and types. Limitations: Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs for that scanner is four at up to 72,000 bps and two at up to 128,000 bps. Due to the sum of LIC weights, the number of LICs may have to be further reduced. Maximum: Eight per LAB Type B (#4772) or four per LAB Type C (#4774). Prerequisites: #4772 or #4774. An ICC on the same LAB, if direct attachment is required. Specify: LIC weights in accordance with Table 4B. Field Installation: Yes.

	DX	128000			

* Former weight 42 and specify codes #9404 and #9424 remain available upon request.

** Prerequisite specify code #6000.

Token-Ring Interface Coupler Type 1 (TIC) (#4981): Provides one attachment to IBM Token-Ring Network. Cables: For each TIC, order one cable group #1666. When 3725 is to be installed in an IBM Token-Ring Network where IBM Cabling System 3 Specified Media (Telephone twisted pair) is used, a Data Grade Media to Type 3 Filter is required between the 3726 TIC cable and the telephone twisted pair wiring. Refer to "IBM Token-Ring Network Twisted Pair Media Guide" (GA27-3714).

Refer to the "Installation Manual-Physical Planning", GC22-7064 for information on available cable lengths. Maximum: Four. Prerequisites: LAB Type C (#4774). Field Installation: Yes.

Configuring and Ordering Procedures of Specified Configurations:

● General:

It is possible to configure a 3725 without following all the rules described in the IBM 3725 Communication Controller Configuration Guide, (Chapter "Graphic Configuration Procedure").

This configuring procedure allows flexibility in placing Line Attachment Base (LAB) Type A or B Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match very specific configuration requirements.

Such configurations are called: "Specified Configurations" and should be ordered with Specify Code #6000.

Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory configuring rules.

For configuring information, refer to the IBM 3725 Communication Controller Configuration Guide, appendix "Configuring and Ordering Specified Configurations", and to the HONE Configurator CF3725.

● Ordering Procedure:

Use CF3725 to configure the 3725 to the customer's requirement.

Specify Code #6000 is required.

Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.

Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department".

Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3727 OPERATOR CONSOLE

PURPOSE

An 3727 operator console when attached to the 3725 Communication Controller provides an operator interface to the Maintenance and Operator Subsystem (MOSS) of the 3725. One primary operator console is required for installation, operation and maintenance of the 3725. An optional alternate operator console may be located at up to 150 meters (492 feet) from the 3725.

MODELS

| **Model 70 70H:** Operator Console 3727 for 200-240V

| **Model 70 70L:** Operator Console 3727 for 100-120V

Note: One order of a 3727 mdl 700 Operator Console automatically provides one logic unit, one keyboard feature, and one display feature, unless otherwise requested.

Note: Language - English US only, Keyboard - English US only.

Prerequisites: One 3725 Communications Controller.

HIGHLIGHTS

- Operator console consisting of three elements: The logic unit, the display feature and the keyboard feature.
- Display of 1,920 characters in 24 rows of 80 characters with operator status on a 25th line.
- Buffered transmission of data as well as field manipulation of data by use of attribute characters.
- English US Keyboard: 59 keys for alphameric and special characters, 12 keys for numeric keypad, 8 keys for cursor control, editing and MOSS interrupt, 5 keys for program functions, and 3 dedicated keys for direct display of MOSS messages, Central Control Unit (CCU) functions and cursor positioning for function selection.

Operator Factors: The operator console has a contrast enhancement filter. The screen is organized by functional areas: 3725 current machine status on the first three lines, pre-prepared menus and operation options in the central part, alarms, messages, and operator information on the last two lines. An audible alarm is provided to alert the operator who may adjust its volume. The display element can be tilted and swivelled to change the screen angle for the operator. The cable-connected keyboard can be moved and has separators to help prevent accidental striking of control keys.

Input Editing Capability: Eight keys control the cursor without affecting any information on the screen: New line, tab, back tab, move-cursor, and backspace keys. In addition three editing keys are provided: Insert character, delete character, and erase keys. All alphameric special characters, and move-cursor keys have typamatic capability.

Maintenance: On-site maintenance will be provided for the 3727.

Cables: The 3727 Operator Console requires an attachment cable to communicate with the 3725 Communication Controller. The primary 3727 operator console is installed with a cable of 7.5 meters (25 feet), which is included in the shipping group of the 3725 Communication Controller.

The alternate operator console is supplied with a cable of 13.5 meters (45 feet). This cable is obtained by ordering cable group #0099 of the 3725. Shorter or longer cable up to 150 meters (490 feet) may be ordered. For details, see "Configuring and Ordering Procedures of Specified Configurations" in the M3725 pages.

SPECIFY

Power and Power Cable

- Power (100-120/200-240V, AC 1 phase, 3-wire, 50/60 Hz):

The third of the 3-character mdl number is used to select the voltage:

3727 mdl 70H for 200-240V
 3727 mdl 70L for 100-120V

- Power cable: 3.0 meters (10 feet)

The 3-digit Country Code entered on the DPMO will be used to select a power cable plug based on the specification most commonly used in that country.

SPECIAL FEATURES

Display (#3255): Provides display screen for the 3727. Displays up to 1,920 characters in 24 rows of 80 characters each. Each character is represented in a maximum 7x14 dot matrix in the 9x16 contiguous box matrix. Displays 70 graphic characters: 26 upper case alphabetic, 10 numerics and 33 special characters plus a space.

Keyboard (#4655): Provides movable keyboard for the 3727. All alphameric, special characters, and move cursor keys have typamatic capability. A 12 key numeric keypad, five program function keys and three special keys are also provided.

3081 Processors Console Table (#1560).

SUPPLIES (NONE)

3728 COMMUNICATION CONTROL MATRIX SWITCH

PURPOSE

The IBM 3728 Communication Control Matrix Switch with its associated control terminal is a data communications switching system that is connected between the Communications Controllers and the modems, and between the modems and the telecommunications lines, that provides the capability of configuring, re-configuring and monitoring the data network from a central location via an operator control terminal.

MODELS

Model 1 001: The 3728 is the basic machine in the system. Port interface options and control options are added to the base 3728 as required by the specific customer configuration. The minimum system uses a single base unit. Larger systems use one base unit and up to 15 extension units. The system size is determined by the number of feature options ordered.

Maximum Configuration: The maximum configurations are as follows:

- Single Unit System
 - 120 interfaces of CCITT V.24/EIA RS-232-C at speeds up to 19.2K bps
 - or 60 interfaces of CCITT V.35 at speeds up to 76.8K bps
 - or 64 interfaces of CCITT X.21 at speeds up to 16K bps
 - or 240 4-wire analog interfaces
 - or a combination of interfaces depending upon card positions utilized.
- Multiple Unit System (Single Location)
 - One base unit (Single Unit System)
 - 15 extension units
 - System capacity up to
 - ▲ 1920 CCITT V.24/EIA RS-232-C at 19.2K bps
 - ▲ or 960 CCITT V.35 at speeds up to 76.8K bps
 - ▲ or 1024 CCITT X.21 at speeds up to 16K bps
 - ▲ or 3840 4-wire analog
 - ▲ or a combination of the above interfaces depending upon port card types and the number of card positions utilized.
- Multiple Location System (NETWORK)
 - Up to 61 nodes. A node is defined as a 3728 System or the Support Processor - IBM PC/XT control terminal. The 3161 Display Station is not classified as a node.
 - Each 3728 System must have at least one control terminal.
- Signals Switched:
 - CCITT V.24/EIA RS-232-C

Ordering Information: The base unit is ordered as the 3728. Each extension unit, up to 15 allowed at each location, is also ordered as the 3728. Each unit, base and extension, will have unique serial numbers applied. Each extension unit ordered (at each location) must have a corresponding specify code assigned to identify the location address of the extension unit within the system configuration.

Note: The control terminals/printers are not provided as a part of the 3728, but must be ordered separately.

Limitations: The signal distortion of the 3728 may result in specific configuration rules for some modem and communication controller environments that could reduce the number of port interfaces allowed in a system configuration. When configuring/ordering the system, refer to the "IBM 3728 Installation Planning and Configuration Guide", GA27-3641 and the Hone Configurator CF3728 for technical details and ordering information.

HIGHLIGHTS

- Characteristics:
 - Rack mount cabinet
 - Card cage assembly
 - ▲ 4 card positions for optional control features

- ▲ 15 card positions for optional port interface features
- Redundant microprocessors, control logic and power supply modules
- Interface Switched:
 - ▲ CCITT V.24/EIA RS-232-C up to 19.2K bps
 - ▲ CCITT V.35 up to 153K bps
 - ▲ CCITT X.21 up to 128K bps
 - ▲ 4-wire analog
- Modular construction accommodates customer's network growth requirements
- Facilities available for connecting external monitor and test equipment on the modem and line interfaces.
- Realtime monitoring of the status of EIA and V.35 signals.

- Control Terminal: The control terminal provides the following capabilities:

- Unattended operation, i.e., control of any 3728 on the network from a central control terminal. The control link between the 3728's may be a leased or switched line or direct-attach cable.
- Menu driven system for reconfiguring network.
- Stored network configurations that can be executed as required.
- Establishing alarm conditions for any line interface.
- Controlling diagnostics and line testing.

The options of the control terminal available are:

- A TTY compatible terminal with the following characteristics:

- Character mode
- Half- or Full-Duplex
- Eight Data Bits
- Two Stop Bits
- Display (24 lines x 80 characters)
- Alphanumeric keyboard

4201 Proprinter and Asynchronous Serial Interface Module.

- (Except Japan > Support Processor - IBM Personal Computer XT

The PC/XT represents one of the 61 available network addresses and is dedicated to 3728 operation.<)

- (Japan only > Support Processor - IBM Personal Computer XT or equivalent. The Support Processor represents one of the 61 available network addresses and is dedicated to 3728 operations.<) This option is not provided as a part of the 3728. The PC/XT can be ordered by the customer from IBM, or from an authorized dealer. The minimum configuration is as follows:

10 MB Fixed Disk Drive (standard)
320 KB Fixed Diskette Drive (standard)
640 K RAM (order increments of #1003 as required)
Standard Keyboard
Color/Graphics Adapter (#4910 or 1504910)
RGB Color Monitor (5153 model 001)
Math Coprocessor Module (#1002 or 1501002)
(2) Asynchronous Communications Adapter (#2074 or 1502074)

Although not required for system operation, the following is recommended:

Printer adapter (#5200 or 15055200)
5182 Color Printer model 001 (with 4-color ribbon P/N 1501573)

The PC/XT, when selected as the control terminal, can be used to control the Maintenance and Operating Subsystem (MOSS) of any 3725/26 in the network where a 3728 is installed.

PC/XTs, when used at the central and remote sites, may replace both the 7427 Console Switching Unit and the associated

3727 primary or alternate console. The characteristics of this application are:

- The operator, at the central location, can control the remote 3725 MOSS attached to the remote 3728.
- With the PC/XT in MOSS mode, notification of 3728 and 3727 messages will be presented to the PC/XT operator.

When the PC/XT is used as the control terminal, IBM 3728 Support Processor licensed program (5668-787) is a pre-requisite and must be ordered separately. For remote MOSS control, a PC/XT is required as the control terminal at the central and remote sites.

When multiple control terminals are attached to the same 3728, the primary control terminal must be located (cable attached) within 6m of the 3728. The alternate terminals can be located (cable attached) up to 35m from the 3728.

- Data Communication Equipment:

- Modems: The following modems or units may be used with the 3728:

Modem (models)	Speed (bps)	Lines
3833-1	2400	Nonswitched voice grade
3834-1	4800	Nonswitched voice grade
3863-1	2400/1200	Nonswitched or switched voice grade
3864-1	4800/2400	Nonswitched or switched voice grade
3865-1/2	9600/4800	Nonswitched voice grade
3868-1	2400/1200	Nonswitched voice grade
3868-2	4800/2400	Nonswitched voice grade
3868-3/4	9600/4800	Nonswitched voice grade
3872-1	2400/1200	Nonswitched or switched voice grade
3976-3	1200/600	Nonswitched or switched voice grade
5811-10	2400 to 19200	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400 to 19200	Nonswitched baseband
5811-28		Rack mount version of 5811-20
5812-10	2400 to 19200	Nonswitched baseband
5812-18		Rack mount version of 5812-10
5865-2/3	9600/7200/4800	Nonswitched voice grade
5866-2/3	14400/9600	Nonswitched voice grade
5868-52		Rack mount version of 5865-2
5868-62		Rack mount version of 5866-1/2

Note: 4-wire SNBU is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire SNBU is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

- PTT Mandatory DCEs: The 3728 attaches the PTT mandatory DCEs meeting CCITT Recommendation V.24, V.28, ISO Standard 2110 and the relevant CCITT Recommendations for data transmission speed. The 3728 attaches the PTT mandatory DCEs meeting CCITT Recommendations V.35 and ISO Standard 2593. The 3728 attaches the PTT mandatory DCEs meeting CCITT recommendation X.21 and ISO Standard 4903.
- Public Data Networks: The 3728 supports the public data networks which provide interfaces complying with the EIA RS-232-C/CCITT Recommendation V.24/V.28 or with the CCITT V.35 Recommendation and are supported by the 3725/3726 Communication Controller. Refer to the 3725/3726 attachments listed in the charts of the M2700 pages. The 3728 supports the public data networks which provide interfaces complying with the EIA RS-232-C/CCITT recommendation V.24/V.28 or with the CCITT V.32/X.21 recommendation and are supported by the 3725/3726 Communication Controller. Refer to the 3725/3726 attachments listed in the charts of the M2700 pages.
- Non-IBM DCEs: Non-IBM DCEs complying with EIA RS-232-C/CCITT Recommendation V.24/V.28 and CCITT V.35 Recommendation may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin. Non-IBM DCEs complying with EIA RS-232-C/CCITT recommendation may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.
- Data Terminal Equipment: The following units may be used with the 3728:
 - 3704 Communication Controller
 - 3705 mdl 2 Communication Controller
 - 3705 mdl 80 Communication Controller
 - 3725 mdls 1/2 Communication Controller
 - 3726 Communication Controller Expansion
 - 3710 Network Controller

The 3728 also supports attachment of the DTE equipment which provide the EIA RS-232-C CCITT Recommendation V.24/V.28 and V.35 Interfaces and are supported by the 3725/3726 Communication Controllers. Refer to the 3725/3726 attachments listed in the charts of the M2700 pages. The 3728 also supports attachment of the DTE equipment which provide the EIA RS-232-C CCITT recommendation V.24/V.28, V.35 and X.21 Interfaces and are supported by the 3725/3726.

- Communication Controllers: Refer to the 3725/3726 attachments listed in the charts of the M2700 pages.

● Applications

- Spare Communication Controller: To improve the reliability/availability of the network by having the lines connected to one communication controller switched to another communication controller when a failure occurs or when the controller is not available.
- Control of Network Load: Large networks that span several time zones can switch lines to the communication controller as required to achieve greater utilization of the network.
- Network Tests and Diagnostics: To maintain network availability, network managers have the capability of performing tests and diagnostics without data traffic interruption. These tests can be centrally controlled but implemented at any remote site in the network.
- Network Growth: For the user that is expanding the network by adding lines or communication controllers, the

3728 can be used to switch lines between controllers, for installation/test, without interrupting other lines on the system.

- Alter Configurations: Change the network configuration to recover from failures of Communication Controller ports, Communication Controllers, modems, or communication lines.

Publications: Following is a list of the publications available for the 3728:

IBM 3728 Introduction Manual, GA27-3640
 IBM 3728 Installation Planning and Configuration Guide, GA27-3641
 IBM 3728 Installation Instructions, SY27-0274
 IBM 3728 Operations Guide, GA27-3643
 IBM 3728 Support Processor Operations Guide, GA27-3644
 IBM 3728 Parts Catalog, S131-0094

HONE Configurator (CF3728): The 3728 may be configured using the CF3728 Aid, available on the HONE System. Using CF3728 will simplify the configuration, ordering, and cabling process for the 3728. The user will enter device attachment and interconnection data and CF3728 will provide a priced feature report for ordering and a graphical configuration report that will be helpful in the cabling process. A copy of this report must be given to the customer and to the CE, as it will be needed to install the DCE and other communication cables.

The HONE configurator will also be used to configure MESs. This procedure provides a list of feature and specify codes which is used to order the MES, and an updated graphical configuration report of the cards in the 3728 units. A copy of the updated configuration on the graphical configuration printout, including the MES order number, must be sent by the marketing representative to the servicing branch office for installation planning purposes. This updated configuration is required by the CE as it provides the only source of internal machine feature location, plugging information for the cards, and connection information for the cables.

Customer Responsibilities: The customer is responsible for:

- Providing an adequate site preparation.
- Verifying that any OEM equipment meets the required criteria.
- Obtaining an adequate control terminal.
- Review the configuration data and verify proper cable lengths prior to order confirmation.
- Obtaining the PC/XT Hardware Maintenance and Service Manual, P/N 6322513, when the PC/XT is selected as the control terminal.
- For remote service capability, IBM maintenance contract customers must provide an external 300/1200 bps, asynchronous, full-duplex modem. When the modem is not being used for remote service the customer can use this modem in conjunction with the 3728 for any customer application.

SPECIFY

Unless indicated otherwise, these specify codes are only available at time of manufacture.

- (Canada only) > Voltage: One of the following must be specified:

#2800	120V, 60 Hz
#9914	240V, 60 Hz

- Power Cables: One power cable from the following table must be specified:

120V	Cable/Length Description	240V
#9016	- 4.3m (14 ft)	Above floor - #9019
#9017	- 4.3m (14 ft)	Below

- #9018 - 1.8m (6 ft) floor - #9019
- #9986 - 1.8m (6 ft) Below floor - #9020
- Above floor - #9020<)
- Power:
- 50 Hz 60 Hz
- 200V #2806 200V #2732
- 220V #2813 220V #2803
- 230V #2821 240V #9914
- 240V #2801 120V #2800
- Machine Nomenclature: There is no external nomenclature.
- Position Code: Each extension unit must be assigned an appropriate specify number as follows:
 - #9001 - Extension Unit #1 (2nd unit)
 - #9002 - Extension Unit #2 (3rd unit) Continue in sequence thru
 - #9015 - Extension Unit #15 (16th unit in system configuration)

SPECIAL FEATURES

CONTROL FEATURES

Base Unit Feature (#4001): Provides one mini cassette drive and a cassette containing the microcode to be loaded in the microprocessors during IPL. The base unit feature is installed on the base unit only. Where multiple systems are interconnected and controlled from a central location, each system at each location must have one base unit. Maximum: One per system. Field Installable: No. Note: There are 4 card slots available in each 3728 unit for the following control features.

Extension Unit Feature (#4002): Extension units are added to the base unit to provide additional port interface options. Extension units communicate with and are controlled from the base unit. This feature provides the control capability to the extension unit from the base unit. This feature is installed in each extension unit. Maximum: One per extension unit; 15 per system. Field Installation: No.

Extension Unit Control (#4003): Provides the capability for all units to be controlled from the base unit. A single control terminal, attached to the base unit, has access to any extension unit within a multi-unit system. Maximum: One per base unit. Field Installation: Yes.

Mini Cassette Tape Drive (#4004): Provides the capability of reducing the IPL time in a system with multiple extension units. This feature is installed in the extension unit and is in addition to the mini cassette tape drive installed in the base unit feature. Maximum: One per extension unit. Field Installation: Yes.

Network Control Interface (#4018): Provides control for multiple systems connected in a network. Any system located remotely may be controlled from a central location. Each system in the network must have this feature installed in the base unit. The control link between the 3728s may be direct cable attached or leased/switched lines at speeds selectable from 75 to 9600 bps. This feature is also required to connect the PC/XT as the control terminal. Maximum: Two per base unit. Field Installation: Yes.

Active/Passive Monitoring Switch (#4019): Provides the capability of permanently connecting one standard test equipment that performs both active testing and passive monitoring functions over a single interface. With this feature, there is no requirement to move the test cable from a 3728 active test port to a 3728 realtime monitor port when switching the test equipment from test to monitor mode.

- Passive monitoring of CCITT V.24/EIA RS-232-C DCE-to-DTE and DTE-to-DTE connections.

- Active testing of: CCITT V.24/EIA RS-232-C DCE equipment connected to a DTE port (#4007). The test equipment must provide a DTE interface. This function requires a DCE port (#4006) dedicated to testing and a realtime monitor port (#4015) for monitoring.
- Active testing and passive monitoring of 4-wire analog interfaces. This function requires an analog port (#4014) dedicated to active testing and an analog real time monitor adapter (#4017) for monitoring.

Prerequisites: #4015 and (#4017 for 4-wire analog). **Maximum:** Four per 3728 unit, in conjunction with #4002, #4003 and #4018. **Field Installation:** Yes. **Limitations:** CCITT V.24/EIA RS-232-C interfaces.

- Active testing of DTE equipment connected to DCE ports (#4006) is not supported by this feature. However, this equipment can be tested by directly connecting the test equipment to a DTE port (#4007).
- Attachment of test equipment that provides a DCE interface is not supported. The equipment must be directly connected to a DTE port (#4007).

PORT INTERFACE FEATURES

Note: There are 15 Port card slots available in each 3728 unit for the following features.

Multi-Unit Switch Communication (#4005): Provides the capability of moving data from one unit to any other in a multiple, co-located, unit system. The capacity of each feature is 8 communication links, which are allocated according to data rate. Supports CCITT V.24/EIA RS-232-C, CCITT V.35, and 4-wire analog interfaces. Supports CCITT V.24/EIA RS-232-C, CCITT V.35, CCITT X.21, and 4-wire analog interfaces. Maximum: Four per unit. Note: In combination with other port interface features, the maximum number of features allowed per unit is 15. Field Installation: Yes. Limitations: All 3728 units within the co-located system must either have the corresponding number of #4005s installed and must be installed physically adjacent or the corresponding port slot must be left vacant.

CCITT V.24/EIA RS-232-C DCE (#4006): Provides eight V.24 DCE ports to attach up to 8 Data Terminal Equipment (DTE) interfaces. Each port switches up to 16 signals. Synchronous and asynchronous operation, with the capability to provide or pass clock, are supported at data rates up to 19.2K bps. The clock speed, set at the plant at 9600 bps, can be changed to 2400, 4800, or 19200 bps in the field by the CE. This feature supports the modem eliminator function by automatically providing the clock when a connection is established between two DCE ports. Maximum: In combination with other port interface features, the maximum number of features allowed per unit is 15. Field Installation: Yes.

CCITT V.24/EIA RS-232-C DTE (#4007): Provides eight V.24 DTE ports to attach up to 8 Data Communication Equipments (DCE) interfaces. All other characteristics are identical to #4006.

CCITT V.35/4 DCE (#4008): Provides four V.35 DCE ports for attaching up to 4 DTE interfaces. Synchronous operation, with the capability to provide or pass clock, is supported at a maximum data rate of 76.8K bps. The clock speed, set at the plant at 56K bps, can be changed to any bit rate from 19.2K bps to 78.8K bps in the field by the CE. This feature supports the modem eliminator function by automatically providing the clock when a connection is established between two DCE ports. Maximum: In combination with other port interface features, the maximum number of features allowed per unit is 15. Field Installation: Yes.

CCITT V.35/4 DTE (#4009): Provides four V.35 DTE ports to attach up to four DCE interfaces. All other characteristics are identical to #4008.

CCITT V.35/2 DCE (#4010): Provides two V.35 DCE ports for attaching up to two DTE interfaces at a maximum data rate of 153K bps. The clock speed, set at the plant at 56K bps, can be changed to any bit rate from 19.2K bps to 153K bps in the field by the CE.

CCITT V.35/2 DTE (#4011): Provides two V.35 DTE ports for attaching up to two DCE interfaces. All other characteristics are identical to #4010.

CCITT V.24/EIA RS-232-C DCE - Version D (#4012): This feature is required in place of #4006 when it has been determined that the specific modem and communication controller environment requires the signal distortion of the 3728 be reduced. All the attachment and speed characteristics of this feature are identical to #4006. Maximum: Seven per 3728 unit. Field Installation: Yes. Limitation: This feature requires two card slots for each #4012 installed in the same 3728 unit.

CCITT V.24/EIA RS-232-C DTE - Version D (#4013): This feature is required in place of #4007 when it has been determined that the specific modem and communication controller environment requires the signal distortion of the 3728 be reduced. All the attachment and speed characteristics of this feature are identical to #4007. Maximum: Seven per 3728 unit. Field Installation: Yes. Limitation: This feature requires two card slots for each #4013 installed in the same 3728 unit.

Analog VF16 (#4014): Provides 16 4-wire analog line interfaces. The interface conforms to CCITT M102 interface specifications. Maximum: In combination with other port interface features, the maximum number of features allowed per unit is 15. Field Installation: Yes.

CCITT V.24/EIA RS-232-C Realtime Monitoring (#4015): Provides the capability for passive realtime monitoring of up to four V.24 lines at up to speeds of 19.2K bps, simultaneously. An RTM (#4015) installed in one unit is capable of monitoring ports in other units (co-located) by using the multiunit switch feature #4005. Maximum: 15 per unit. Field Installation: Yes.

CCITT V.35 Realtime Monitoring and Test (#4016): Provides the capability for passive realtime monitoring and active test of up to two V.35 lines simultaneously at speeds up to 153K bps. This feature installed in one unit is capable of monitoring and testing ports in other units (co-located) by using the multiunit feature #4005 at speeds up to 76.8K bps only. Maximum: 15 per unit. Field Installation: Yes.

Analog Realtime Monitoring Adapter (#4017): Provides the capability for passive monitoring of analog lines. This feature does not require a port feature slot. Prerequisite: #4015. Maximum: 4 per #4015s installed. Field Installation: Yes.

CCITT X.21/8 DCE (#4041): Provides eight X.21 DEC ports for attaching up to eight DTE interfaces. Synchronous operation, with the capability to provide or pass clock, is supported at a maximum data rate of 16K bps. The clock speed, set at the plant at 9.6K bps, can be changed to any bit rate from 9.6K bps to 16K bps in the field by the CE. This feature supports the modem eliminator function by automatically providing the clock when a connection is established between two DCE ports. Maximum: Eight per unit. Field Installation: Yes. Limitation: The Hone Configurator must be used to determine the maximum number of features allowed when used in combination with other port interface features.

CCITT X.21/8 DTE (#4042): Provides eight X.21 DTE ports for attaching up to eight DCE interfaces. All other characteristics are identical to #4041.

CCITT X.21 DCE (#4043): Provides four X.21 DCE ports for attaching up to four DTE interfaces at a maximum data rate of 32K bps. The clock speed is set at the plant at 19.2K bps. All other characteristics are identical to #4041.

CCITT X.21/4 DTE (#4044): Provides four X.21 DTE ports for attaching up to four DCE interfaces. All other characteristics are identical to #4043.

CCITT X.21/2 DCE (#4045): Provides two DCE ports for attaching up to two DTE interfaces at a maximum data rate of 64K bps. The clock speed is set at the plant at 48K bps. All other characteristics are identical to #4041.

CCITT X.21/2 DTE (#4046): Provides two X.21 DTE ports for attaching up to two DCE interfaces. All other characteristics are identical to #4045.

CCITT X.21/1 DCE (#4047): Provides one DCE port for attaching one DTE interface at a maximum data rate of 128K bps. The clock speed is set at the plant at 128K bps. All other characteristics are identical to #4041.

CCITT X.21/1 DTE (#4048): Provides one X.21 DTE port for attaching one DCE interface. All other characteristics are identical to #4047.

CABLE FEATURES

Cables can be ordered from IBM with the machine by Special Feature Codes and are priced separately from the corresponding port feature. The cable lengths indicated are the usable dimensions, i.e., the length outside the connecting machines and do not include the lengths required inside the machines.

Default cable lengths, for each type of external connection, are automatically included as a part of the Hone Configurator, CF3728.

CF3728 HONE configurator provides the capability of changing the cable lengths as requested by the user during the configuration procedures, either at initial order or alteration order time, or for MESSs.

If the customer chooses to procure the cables from sources other than IBM, reference should be made to the "IBM 3728 Installation Planning and Configuration Guide", GA27-3641 for the appropriate specifications.

The adapters shipped with the 3725 cable must be removed from the 3725 cable and plugged into the modem end of the 3728 modem cable for attachment to the PTT modems.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Accessories are ordered specifying the appropriate part number.

Direct Attach Kit (P/N 6431166): Provides the hardware kit required to plug the existing direct attach cables of the 3725. This kit is only required for existing installed 3725 cables. New orders for the 3725 cables do not require this kit.

SUPPLIES (NONE)

MACHINES

3732 TEXT DISPLAY STATION
PURPOSE

Provides a text entry and editing keyboard and display for the 3730 Distributed Office Communication System and the 8100 Information System.

MODELS

Model 1 001

Prerequisites: Either 3791 Controller, mdl 11C, 12A, or 12B, with #9171 installed (refer to M3791 pages for details) or an 8100 Information System with #1501 or #1502 (refer to M8100 pages for details).

HIGHLIGHTS

The 3732 consists of a display and keyboard (special feature) that have been designed specifically to provide text entry and editing facilities for the 3730 Distributed Office Communication System and 8100 Information System. The 3732 displays all the text characters that can be entered at the keyboard. In addition, special graphic characters are displayed to denote certain text control functions. The 3732 must be installed with a keyboard.

Display: The display is a 15-inch (diagonal) cathode ray tube display providing 24 lines of 80 characters each, to give a total of 1920 characters. For text entry and editing, lines 1 and 24 are reserved for system use, leaving 22 lines for text entry (line 1 displays a scale to indicate character position, and is used to display formatting information such as margin settings and tab stops, and to track cursor position; line 24 is used to display status information). When, with user-programming, the 3732 is used for full-screen processing, the user has control over all 24 lines (except for minor restrictions on the use of lines 1 and 24). The display includes an anti-glare screen.

Keyboards: A 77-Key Typewriter Keyboard (#4621) is available as a special feature. Alternatively, in Canada, a 77-Key ASCII Typewriter Keyboard (#4622) is available as a special feature. Both keyboards contain a 48-key text entry section that is similar in layout to typewriter keyboards. This text entry section allows a user to enter up to 96 characters, including upper and lower case characters, and, in addition, accented characters with the Canadian French keyboard. The keyboards also contain 29 function and control keys concerned with document creation, editing, formatting, and printing.

Text Functions: The following text entry and editing functions are provided by the 3732:

Automatic new line and word spill (allowing an operator to enter text without being concerned about line endings)

Temporary left margin (providing automatic indentation)

Adjustable right margin

Adjust and no-adjust entry mode

Insert mode

Tabulation (providing normal, decimal, and centering tab stops)

Column tabulation (allowing an operator to enter tabular material column-by-column)

Required characters (new line, space, backspace, hyphen)

Special characters (such as superscripts, subscripts, temporary left margin)

Creation of accented characters using dead keys for certain keyboard languages

Delete character, word

Backspace deletion

Underscore character, word, or group of words (separated by required spaces)

System Functions: The following system functions are invoked using function keys on the 3732 keyboard:

Block insert, copy, move, return, delete

Delete line, sentence

Screen advance, return

Page advance, return

Go to End, Go to Top of document

A HELP key to aid users who have problems when operating the 3732.

A PRINT key to send the currently displayed document to a preassigned print queue, for printing as soon as the assigned printer is available.

An ADJUST key to adjust the line length of the currently displayed document and to divide the document into pages.

When attached to the 8100 Information System, the following system functions may be invoked using function keys on the 3732 keyboard: Screen Left ... Screen Right ... Column Edit.

Additional 3732 functions:

Cursor-positioning keys to move the display cursor to any position within the display area (up, down, left, right, and "home" - the first available text character position).

An audible alarm tone, similar to the bell on a typewriter, warns an operator that a line or a screen is nearly full (for example, in no-adjust mode the alarm tone sounds when a character is entered or moved into a position five characters from the right margin).

A DISP key to allow or inhibit the display of certain special characters (such as space, and tabs).

Attachment: The 3732 attaches to a 3791 Controller mdl 11C, 12A, 12B or to the 8100 Information System with the Display and Printer Attachment via a coaxial cable at a distance up to 609 meters (2,000 feet) or shielded twisted-pair cable at a distance up to 152 meters (500 feet).

Security And Integrity Features: A Security Keylock (#6340) helps prevent unauthorized use of the 3732. Text cannot normally be displayed or modified unless the key is in the On position.

Problem Determination Procedures: To minimize machine downtime, users are encouraged to determine the cause of 3732 malfunctions using IBM-provided Problem Determination Procedures. Data obtained from these procedures is used to correct customer operating or programming errors, or is passed to a CE to aid in isolating a machine malfunction. The Problem Determination Procedures are presented in an easy-to-follow graphic form and are contained in the 3732 Problem Determination Guide (GA33-3024 without #9610 and GA33-3087 with #9610), which is stored in the Keyboard.

Publications: Refer to the latest level of *IBM System/370 Bibliography of Industry Systems and Application Programs* (GC20-0370), for details of 3730 system publications including 3732 on 3730. Refer to *8100 Information System Bibliography* (GC20-8100), for details of publications including 3732 on 8100.

SPECIFY
(Canada only-)

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): #9890 for locking plug, or #9891 for non-locking plug. +)

(Except Canada-)

- Power (AC, 1-phase): Specify #2998, and one of the following:

50 Hz	60 Hz
110V #2805	120V #9911
220V #2813	
230V #2821	
240V #2801	+))

- Power Cable Length: If standard 2.8 meter (9 foot) power cable is not required, specify #9513 for 4.5 meter (15 foot) cable.

- Machine Nomenclature (the language of the physical markings on the machine): Specify one of the following:

Canadian French #2935	French #2928
English UK #2927	Spanish #2931
English US #2924	

- Character Set Language: Specify one of the following:

Canadian English #2778	French AZERTY #2764
Canadian French #2777	French QWERTY #2770
English UK #2758	Spanish #2760
English US #2756	

MACHINES
3732 Text Display Station (cont'd)

- Keyboard Language: When ordering the 77-Key Typewriter Keyboard (#4621), also specify one of the following:

Canadian English #2978	French AZERTY #2964
Canadian French #2977	French QWERTY #2970
English UK #2958	Spanish #2960
English US #2956	
- Keyboard Layouts: Keyboard layouts are shown in *3730 Distributed Office Communication System: Introduction* (GA33-3021), for 3732 without the 8100 attachment #9610 and in *IBM 3732 Text Display Station for the 8100 Information System Introduction and Configurator* (GA33-3084), for 3732 with #9610.
- 8100 Attachment: #9610 for attachment to 8100 Information System. When thus specified, the 3732 cannot be attached to a 3791 Controller. **Field Installation:** Yes.
- Cables: See "Accessories" for cables... also for cable specifications, when the 3732 is attached to a 3730 System, see *3790 Communication System Installation Manual Physical Planning* (GA27-2769). For cable specifications when the 3732 is attached to an 8100 Information System see *IBM 3732 Text Display Station for IBM 8100 Information System Installation Manual Physical Planning* (GA33-3082).

SPECIAL FEATURES

77-Key Typewriter Keyboard (#4621): Movable typewriter-like layout, with 48 text entry keys and 29 function and control keys. See "Specify". **Maximum:** One keyboard (#4621). **Field Installation:** Yes. **Prerequisites:** Keyboard Language (see "Specify").

Security Keylock (#6340): A lock and key that normally prevent modification or display of the data in the display when the key is in the Off position. For additional or replacement keys, see "Accessories". **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS (None)
ACCESSORIES

Keylock, Keys: The 3732 with Keylock (#6340) is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys *only* to original purchaser.) A letter of authorization with key identification number must accompany each order. Specify P/N 2577741. Allow three weeks for delivery.

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted-Pair Cable: For proper identification, installation and application of cable and associated accessories, refer to *IBM Cabling System - Planning and Installation Guide*, GA27-3361. For pricing and ordering information, refer to the Systems Supplies operation within your country.

Coaxial Cable: For proper identification, installation and application of cable and associated accessories, refer to *IBM 3270 Installation Manual - Physical Planning*, GA27-2787, and *Coaxial Cable and Accessories Manual*, GA27-2805.

Item	Number	Description (Note 1)
ASSM	2577672	Cable Assembly In-Door
BULK	0323921	Coax Wire (Note 2)
P/N	1836418	Connector Kit (Note 2)
ASSM	1833108	Cable Assembly Out-Door
BULK	5252750	Coax Wire (Note 3)
P/N	1836419	Connector Kit (Note 3)
P/N	1833104	Station Protector Kit Carbon (Note 5)
P/N	5252772	Station Protector Element Carbon (Note 7)
P/N	2621414	Modification Kit (Note 4)
P/N	1833106	Station Protector Attachment Kit (Note 6)
P/N	5252643	Adapter (Note 8)
P/N	1830818	Station Protection Kit, Gas (Note 5)
P/N	5252899	Station Protector Element, Gas (Note 7)

Notes:

1. Order the above items via MES from Poughkeepsie. Allow a lead time of 120 days.
2. Coax wire and one connector kit (includes two connectors #1836446) required for each indoor cable assembly.
3. Coax wire and one connector kit (includes two connectors #1836447) required for each outdoor cable assembly.
4. Customers replacing 2260 display stations may utilize the existing installed cable by use of this modification kit. One kit required for each cable.
5. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
6. Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
7. Replacement station protector elements.
8. Use to join two #2577672 or two #1833108 cable assemblies together.

3773 COMMUNICATION TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

This desk-style console-keyboard-printer includes as standard a diskette storage device with removable, reusable diskette. It is a member of the 3770 Data Communication System. Communication features permit operation over switched or nonswitched facilities at speeds up to 4800 bps. It uses the SDLC or BSC transmission technique.

MODELS

Model 1, P1	001, P01	40 cps average print rate, bidirectional
Model 2, P2	002, P01	80 cps maximum, bidirectional
Model 3, P3	003, P03	120 cps maximum, bidirectional

The prefix "P" on the model number designates user-programmable.

HIGHLIGHTS

Not applicable for a withdrawn machine.

SPECIFY

- Power: (AC, 1-phase):

50 Hz	60 Hz
100V (#2804)	100V (#2730)
110V (#2805)	115V (#9901)
123.5V (#2811)	200V (#2732)
200V (#2806)	220V (#2803)
220V (#2813)	
235V (#2814)	
- Power Cords: One must be specified.
 - #2760 - 50 Hz cord without plug
 - #2762 - 60 Hz cord without plug
- Color Group: #9041 - Red, #9042 - Yellow, #9043 - Blue, #9045 - Gray. Note: Available at time of manufacture only.
- Machine Nomenclature: One must be specified.

English (#2927)	Italian (#2932)
French (#2928)	Japanese (#2930)
German (#2929)	Spanish (#2931)

 Note: Not recommended for field installation.
- Keyboard Arrangement: One must be specified.

Brazilian (#2975)	Japanese (#2955)
French (#2970)	Japanese Katakana (#2973)
German (#2957)	Spanish (#2960)
International (#2950)	Spanish Speaking (#2969)
Italian (#2968)	

 Note: Not recommended for field installation.
- Remote Power Off: #9501 ... specify this feature for capability to "power down" terminal from the host CPU using a controlled data sequence over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning*, GA27-3006.

SPECIAL FEATURES

Special features are on an "As Available" basis for field installation, except #1201 and #4660 which cannot be field installed.

For communication capability: Select one Communication feature (#1460, #1461, or #1470); one Communication Driver (#1481 or #1482); and one Integrated Modem (#5500, 5501, 5502 or EIA/CCITT Interface (#3701). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

Communication Features

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point-to-point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** #1460 or #1461.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Limitations:** Not with #1460 or #1461. **Maximum:** One.

Communication Driver Without Business Machine Clocking (#1481): Provides a communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

Communication Driver With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200-bps clocking. Normal/Half speed switch on operator panel allows selection of 1200- or 600-bps operation of the clock. **Limitations:** Not with #1481. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

CCITT Interface (#3701): Provides a cable and interface meeting CCITT-V24 characteristics for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations, refer to M2700 Pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds of up to 2400 bps for switched, or up to 4800 bps for nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3901) on an adjacent terminal or on an IBM 3863, 3864, 3872 or 3874 modem. This feature in conjunction with #1482 can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Not with 1200 bps Integrated Modem. **Maximum:** One. **Prerequisites:** #1481 or #1482.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. Half-speed operation at 600 bps is under manual switch control. **Limitations:** Not with #3701 or with another integrated modem. **Maximum:** One. **Prerequisites:** #1482.

1200 bps Integrated Modem, WTPSN, Auto Answer (#5501): Provides for point-to-point operation over public switched telephone network using manual originate/auto answer for establishing connection. Half-speed operation at 600 bps is under manual switch control. **Limitations:** Not with #3701 or with another integrated modem. **Maximum:** One. **Prerequisites:** #1482.

Non-Communication Features

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. Refer to "Accessories" for information on additional or replacement keys. **Maximum:** One.

Keypad, Numeric (#4660): Provides a keypad in adding machine arrangement to facilitate rapid entry of numeric only data. **Limitations:** Not available for mdls 1, 2 or 3. **Maximum:** One. **Field Installation:** Not recommended. **Prerequisites:** Mdl P1, P2 or P3.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 in. x 2-1/8 in. ranging from 0.007 in. to 0.045 in. thick may be read. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. For programmable terminal the Operator ID Reader (#5450) is under control of the 3770 application program. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One.

Storage Increment 4K (#6800): Provides an additional 4,096 bytes of programmable storage. **Limitations:** Not available for mdls 1, 2 or 3. Not with #6800. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Mdl P1, P2 or P3.

IBM Canada Ltd.

MACHINES

3773 Communication Terminal (cont'd)

Storage Increment 8K (#6801): Provides an additional 8,192 bytes of programmable storage. **Limitations:** Not available for mdls 1, 2 or 3. Not with #6800. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Mdl P1, P2 or P3.

Variable Width Forms Tractor (#8700): Provides a forms feeding device for continuous edge-punched forms. Overall forms width from 3.0 to 15.0 in. can be accommodated. Refer to *Forms Design Reference Guide for Printers*, GA24-3488. **Maximum:** One.

MODEL CONVERSIONS (None)

The Following Table Has Been Revised:

TERMS and CONDITIONS

Plan Offering: Plan B	Educational Allowance: Yes
Purchase Option: 50 %	Pre-Installation Test Allowance: Per
Machine Group: D	host processor establishment per
Per Call: 1	country = 12 hours (first unit
Warranty: B	only)

ACCESSORIES

The following items are available on a purchase only basis.

Forms Stand (#4450): A two-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing.

Locks and Keys: Keylock (#4650) is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization must accompany each order.

SUPPLIES (None)

M 3773.2

Jul 83

3774 COMMUNICATION TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

This desk-style console-keyboard-printer is a member of the 3770 Data Communication System. The basic printer operates at a maximum speed of 80 or 120 characters per second and prints bidirectionally, serially by character, using a wire-matrix print head. Special features permit one or two diskette storage devices and provide for the attachment of an additional printer, the 3784 Line Printer, and one card reader and one card punch. One of three card readers can be selected for operation at speeds of 50, 150, or 300 cards per minute. The card punch operates at 50 cards per minute.

Communication features allow for operation over switched or non-switched facilities at speeds of up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS

Model 1	001,	80 cps maximum, bi-directional printer
Model 2	002,	120 cps maximum, bi-directional printer

HIGHLIGHTS

Keyboard: All countries except Japan Katakana use EBCDIC arrangement with 47 data keys (produces 94 characters). Japan Katakana uses 48 data keys in EBCDIC arrangement (produces 128 characters). Underscore/Hyphen, Backspace, Space and "Print Character" keys have typamatic operation. Typamatic operation is provided for Backspace, Space, Tab, New Line, and "Print Character" models keys. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer: Prints serially by character at a maximum rate of 80 or 120 characters per second while the wire-matrix print head is moving in either direction: Bidirectional printing. Print span is 132 positions at 10 characters per inch. Line spacing is 6 lines per inch. Single-part continuous forms or cut forms of up to three parts can be handled with the standard friction feed platen. A variable-width forms tractor, available as a special feature, is required for feeding multipart or preprinted continuous forms of up to six parts maximum (total thickness not greater than 0.018 in.). Five- and six-part continuous forms should be tried on an individual basis for acceptable feeding, registration, and print quality. Overall form widths of from 3.0 in. to 15.0 in. can be accommodated. To facilitate handling of continuous forms, the Forms Stand (See "Accessories") is recommended. Card stock continuous forms are not recommended. Refer to GA24-3488 for forms design considerations. A 94-character set is standard. (128-character Katakana set is provided when Katakana keyboard is specified.)

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See IBM 3770 Data Communication System, GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem identification and recovery routines and procedures that are easily understood and used by the operator. See IBM 3774/3775 Operating Procedures Guide, GA27-3094 or IBM 3773, 3774, and 3775 Programmable Communication Terminals Operator's Guide, GA27-3114.

Communications: See "Special Features". Transmission over switched or nonswitched facilities at speeds of up to 4800 bps are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on Customer Responsibilities, Communication Facilities, and other attachment information, and to M3872 pages.

The 2400 bps Integrated Modem and IBM 3872 Modem, when appropriately configured, can be intermixed on the same communication facility. The 1200 bps Integrated Modem and IBM 3976 mdl 3 Modem, when appropriately configured, can be intermixed on the same communication facility. (Japan only) NTT and other non-IBM modems can be attached via the CCITT feature.

Prerequisites:

For SDLC Communications with S/370 or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program/Virtual Storage (NCP/VS) attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1, or OS/VS2, or these operating systems running under VM/370.

For BSC Communications with S/360, S/370 or 4300 Processors: A virtual storage S/370 or 4300 processor operating under DOS/VS, OS/VS1 or OS/VS2, or under RSCS and VM/370, or any of these operating systems running under VM/370. The 3770 Communication Terminals use 2770 BSC programming support when operating in BSC mode. Operation with S/360, S/370, or 4300 processors using 2770 BSC programming is also permitted. The customer may have to modify existing 2770 application programs. See GA27-3097 for BSC compatibility considerations. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller or a 2701 Data Adapter Unit attached to a channel of any virtual storage S/370 or 4300 processor or via an Integrated Communications Adapter on S/370; or via a Communications Adapter feature on the 4331 or 4361 processor. BSC attachment can be made via a 3704/3705 Communications Controller attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75, and 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in 65 mode), 75, and 195; or via an Integrated Communications Attachment on S/360 mdl 25. Note: The 3725 is not connectable to S/360.

HIGHLIGHTS - With Emulator

Dual 256-Byte Buffers: Transfer data between the input and output devices. The buffers alternate in providing input and output service to permit overlapped operation.

Buffer Edit: Allows corrections to be made on the contents of a buffer during key entry jobs. A 256-byte diskette record, if the diskette feature is present, can also be retrieved into the buffer using Update Mode and be corrected using buffer edit functions. Corrections can be made by character, by line, or by entire buffer (up to 256 bytes).

Extend Buffer: Combines the dual 256-byte buffers into a single 512-byte buffer under operator control for keyboard-to-line or keyboard-to-diskette jobs. Buffer edit capability applies to the full 512 bytes. Buffer transfers to line or diskette are in 256-byte increments and cannot be overlapped.

Printer Format Controls: Facilitates the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Format controls for up to five jobs can be entered from keyboard, or from diskette or card if either one of these devices is attached.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards. A 2-byte sequence is substituted for each occurrence of three or more consecutive blank card columns (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 64 consecutive blank columns are read. The terminal monitors the non-transparent data received that is destined for printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks. A similar capability is provided when using SDLC procedures.

Auto Interrupt: Allows the terminal to automatically interrupt an offline job for an online job initiated by the host processor. The terminal stops the offline job, executes the online job for receiving line data, and automatically restarts the offline job without operator intervention. A manual switch on the keyboard enables/disables this mode of operation. See "Operating Characteristics-Automatic Interrupt" in 3770 System Components Manual, GA27-3097.

Input/Output Job Definitions: Can be operator- or terminal-defined. Up to five operator-defined jobs can be read from diskette or card reader to facilitate rapid job set-up when the terminal is equipped with either of the special features; otherwise they can be entered from keyboard under control of a prompting sequence and executed from temporary storage. Printer format controls can be part of the job definition. An appropriately configured 3774 will permit input/output job designations as follows:

3774 Communication Terminal (cont'd)

Input	Output
Offline Jobs	
Keyboard ¹	Console Printer, Diskette, Card Punch, or Printer Second
Diskette ²	Console Printer, Diskette, Card Punch, or Printer Second
Card Reader ²	Console Printer, Diskette, Card Punch, or Printer Second
Keyboard & Diskette ³	Console Printer & either Diskette or Card Punch
Keyboard and Card Reader ³	Console Printer & either Diskette or Card Punch
Online Batch Jobs	
Diskette or Card Reader ²	Line
Line ²	Console Printer, Diskette, Card Punch, or Printer Second
Online Interactive Jobs	
Keyboard ¹	Line
Line	Console Printer

Notes:

- ¹ One input and one output device per job. Output-to-console printer is automatic when input is keyboard.
- ² One input device and one output device per job. Monitor print is an additional output option when Diskette, Card Punch, or Line is the output device.
- ³ Record Format feature (#6010) is required in addition to I/O devices to allow multiple input and output devices for a job.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard and console printer are standard. For other configurations, refer to "Special Features" below.

Publications: GC20-0001

SPECIFY

- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	220V #2803
220V #2813	
235V #2814	

Power Cord: One must be specified.

#2760 - 50 Hz cord without plug.
#2762 - 60 Hz cord without plug.

- Color: One must be specified. #9041 for Red, #9042 for Yellow, #9043 for Blue, #9045 for Gray. Note: Available at time of manufacture only.
- Remote Power Off (#9501): Specify this feature for capability to "power down" terminal from the host processor using a controlled data sequence sent over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning*, GA27-3006.
- Machine Nomenclature: #2930 - Japanese
- Keyboard Arrangement: One must be specified. Note: Not recommended for field installation.
 - #2950 - International
 - #2955 - Japan
 - #2957 - Germany
 - #2960 - Spain
 - #2968 - Italy
 - #2969 - Spanish Speaking
 - #2970 - France
 - #2973 - Japan Katakana
 - #2975 - Brazil

SPECIAL FEATURES

All special features are on an "As Available" basis for field installation, except Keypad feature (#4660) for which field installation is not recommended.

COMMUNICATIONS FEATURES

For Communication Capability: Select one from each group:

- One Communication Feature (#1460, #1461 or #1470)*
- One Communication Driver (#1481 or #1482)
- EIA/CCITT Interface (#3701), X.21 Adapter for Nonswitched Networks (#5655) or One Integrated Modem (#5500, #5600, #5602, or #2881).

* #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** #1461 or #1460.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Maximum:** One. **Limitations:** Not with #1460 or #1461.

Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200 bps clocking. Normal/half-speed switch on operator panel allows selection of 1200 or 600 bps operation of the clock. **Limitations:** Not with #1481. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

EIA/CCITT Interface (#3701): Provides a CCITT interface and cable for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds of up to 4800 bps for switched and nonswitched operation are permitted. This feature, in combination with #1481, can be used to attach to Modem Fan-Out (#3901) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. This feature, in combination with #1482, can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Not with Integrated Modem features. Not with X.21 Adapter for Nonswitched Networks (#5655). **Maximum:** One. **Prerequisites:** #1481 or #1482. Note: In Japan, Specify Code #2946 must be supplied to satisfy the NTT's DTE Self-test requirements when attaching a non-IBM modem.

2400 bps Integrated Modem, Switched, Caducee Network (#2881): This self-clocked modem provides for point-to-point operation over the Caducee switched network. Operator controls provide for half-speed operation and Talk/Data. **Limitations:** Not with CCITT Interface (#3701 or #3655), or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. Half-speed operation at 600 bps is under manual switch control. **Limitations:** Not with #3701, #5655 or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1482. (Japan only - also specify #2943 for NTT D-1 Service Connection. +)

2400 bps Integrated Modem, Nonswitched Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. **Limitations:** Not with #3701, #5655 or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481. (Japan only - also specify #2943 for NTT D-1 Service Connection. +)

3774 Communication Terminal (cont'd)

2400 bps Integrated Modem, Nonswitched Multipoint (#5602): This self-clocked modem provides for multipoint operation over non-switched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. **Limitations:** Not with #3701, #5655 or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481. For Japan only: also specify #2943 for NTT D-1 Service Connection.

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT-X.21 characteristics for attachment of data communication equipment. Feature operates only over Non-switched lines using SDLC procedures. Speeds of 2400 or 4800 bps are permitted. **Limitations:** 1) Japan DDC Nonswitched Network only. 2) Not with #3701. 3) Not with Integrated Modem features. **Maximum:** One. **Prerequisites:** #1481 and #1470.

Modem Fan-Out (#3901): [2400 bps Integrated Modem] Equips the 2400 bps Integrated Modem, Nonswitched Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. **Limitations:** This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. **Maximum:** One. **Prerequisites:** #5602.

NON-COMMUNICATIONS FEATURES

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Door Keylock (#3401): [Single use charge] Provides one keylock and two keys for the desk-console door. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Door Keylocks, Dual (#3402): [Single use charge] Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Prerequisites:** #4902.

Keylock (#4650): [Single use charge] Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. See "Accessories" for information on additional or replacement keys. **Maximum:** One.

Diskette Storage, First (#4901): One device with a customer-removable diskette is placed in the left cabinet. Additional diskettes are available. Characteristics of the diskette storage device are: one movable read/write head, one read/write surface, 73 data tracks, 26 sectors per track, and 128 bytes per sector. Up to 949 256-byte records can be stored on the diskette (one 256-byte data record is reserved for job identification information in 3774 mdl 1 and 2.). Each 256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode (3774 mdl 1 and 2). An Update Switch on the 3774 mdl 1 and 2 provides the operator with the capability of reading a 256-byte diskette record into the terminal buffer where it can be printed, edited, or deleted. **Maximum:** One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first (#4901). It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for:

- **Copy:** Data can be copied from diskette 1 to diskette 2 (single data set or all active data sets.)
- **Concatenate (pool):** The ability to concatenate on a data set basis.
- **Continue:** Allows a read or write operation to automatically continue to diskette 2 if it has been placed in a ready condition. Continue is not allowed while keying data.
- **Record Update:** Allows a record to be read into the buffer from diskette 1, updated from keyboard, and written to the other diskette.
- Record Format feature (#6010) is a prerequisite for this update capability.

Maximum: One. **Field Installation:** Yes. Color will be the same as that specified for the base machine. **Prerequisites:** #4901.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 in. x 2-1/8 in. ranging from 0.007 to 0.045 in. thick may be read. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5.0 in. and 40.0 in. per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One.

Record Format (#6010): Provides an offline capability for constructing records using more than one input and output device. Input can be keyboard, and either diskette or an attached card reader. Output can be console printer, and either diskette or an attached card punch. A record format specification record stored on diskette can be defined and changed by the user to permit selection, by field, for merging or creating, in any sequence within a transaction cycle. It also permits selecting output by field. There may be multiple fields within a transaction and multiple transaction cycles within a job. Provision is also made with this feature for self-checking, decimal insertion, right justify and fill, and numeric checking. A record format specification record can be loaded to diskette from the line, keyboard, or card reader. This feature increases the size of "extend buffer" from 512 to 2,048 bytes. **Limitations:** Extend buffer and update operation is not permitted for a record format job. A record format job cannot be interrupted by the processor automatically; operator intervention is required. **Maximum:** One. **Prerequisites:** #4901.

3501 Card Reader Attachment (#8050): Provides for attachment of the 3501 Card Reader. **Limitations:** Not with 3782/2502 Card Reader Attachment (#8149). **Maximum:** One.

3782/2502 Card Reader Attachment (#8149): Provides for the attachment of the 3782 Card Attachment Unit mdl 2 and 2502 Card Reader mdl A1 or A2. The 2502 can be equipped with special features for 51/80 or 66/80 column cards and/or Optical Mark Read. A companion Optical Mark Read special feature is required on the 3782 mdl 2. **Limitations:** Not with 3501 Card Reader Attachment (#8050). **Maximum:** One.

3782/3521 Card Punch Attachment (#8150): Provides for attachment of the 3782 Card Attachment Unit mdl 1 and the 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print or Card Print Katakana. **Limitations:** If a 2502 or 3501 Card Reader is also attached (#8149 or #8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

3784 Printer Attachment (#8155): Provides for the attachment of the 3784 Line Printer as a second printer. **Maximum:** One.

Variable-Width Forms Tractor (#8700): Provides a forms feeding device for continuous edge-punched forms. Overall forms width from 3.0 in. to 15.0 in. can be fed. Refer to *Forms Design Reference Guide for Printers*, GA24-3488. **Maximum:** One.

MODEL CONVERSIONS

Are field installable and are on an "As Available" basis.

ACCESSORIES

Forms Stand (#4450): A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. For shipment with the machine, order by feature number.

Locks and Keys: The Keylock #4650 special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

SUPPLIES

Ribbons: A black ribbon, P/N 1136653, or equivalent, is required. Contact IBM.

3775 COMMUNICATION TERMINAL**PURPOSE**

This desk-style console-keyboard-printer is a member of the 3770 Data Communication System. The basic printer operates at a maximum speed of 120 lines per minute using a 64-character set or 80 lines per minute using a 94-character set or 40 lines per minute using a 128-character set. An engraved character font print belt can be interchanged by the operator. Special features permit one or two diskette storage devices and provide for the attachment of one card reader and one card punch. One of three card readers may be selected for operation at a speed of 50, 150, or 300 cards per minute. The card punch operates at 50 cards per minute.

Communication features allow for operation over switched or non-switched facilities at speeds of up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS

Model 1 001: (NO LONGER AVAILABLE) (Non-programmable): 80/120 lpm printer (40 lpm with Katakana)

HIGHLIGHTS

- **Keyboard:** All countries except Japan Katakana use EBCDIC arrangement with 47 data keys (produces 94 characters). Underscore/Hyphen, Backspace, Space and "Print Character" keys have typamatic operation. Japan Katakana uses 48 data keys in EBCDIC arrangement (produces 128 characters). Typamatic operation is provided for Backspace, Space, Tab, New Line, and "Print Character" keys. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.
- **Printer:** During a key entry job, the print platen lowers to provide print line visibility. Printing is from characters engraved on a revolving print belt. Included as standard is one interchangeable print belt (either 64- or 94-character set) or one operator interchangeable 128-character Katakana set with the Japanese 64-character layout as a subset. Therefore, in the latter case, with the 64-character set belt mounted on a Katakana machine, a corresponding increase in throughput will result. Also included are a variable-width forms tractor for feeding continuous forms up to 15 inches overall width, paper jam detection, and 132 print positions. Character spacing is 10 per inch; line spacing is 6 or 8 per inch. Maximum print speed is 120 lines per minute with the 64-character set or 80 lines per minute with the 94-character set or 40 lines per minute using a 128-character set. Continuous card stock forms are not recommended. Refer to GA24-3488 for forms design considerations.
- **Performance Considerations:** Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See IBM 3770 Data Communication System, GA27-3097, for additional information.
- **Problem Determination Procedures:** Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem identification and recovery routines and procedures that are easily understood and used by the operator. See IBM 3775/3775 Operating Procedures Guide, GA27-3094 or IBM 3773, 3774, and 3775 Programmable Communications Terminals Operator's Guide, GA27-3114.
- **Communications:** See "Special Features".

Transmission over switched or nonswitched facilities at speeds up to 4800 bps are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on Customer Responsibilities, Communication Facilities, and other attachment information, and to M3872 and 3874 pages.

The 2400 bps Integrated Modem and 3872 Modem, when appropriately configured, can be intermixed on the same communication facility. The 1200 bps Integrated Modem and 3976 mdl 3 Modem, when appropriately configured, can be intermixed on the same communication facility. (Japan only > NTT and other non-IBM modems can be attached via the CCITT feature. <)

Prerequisites: For SDLC Communications with S/370 or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program/Virtual Storage (NCP/VS) attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1, or OS/VS2; or these operating systems running under VM/370.

For BSC Communications with S/360, S/370 or 4300 Processors: A virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2, and VM/370, or any of these operating systems running under VM/370. The 3770 Communication Terminals use 2770 BSC programming support when operating in BSC mode. Operation with S/360, S/370 or 4300 Processors using 2770 BSC programming is also permitted. The customer will have to modify existing application programs for operation with programmable models of the 3775. See GA27-3097 for BSC compatibility considerations. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller or a 2701 Data-Adapter Unit attached to a channel of any virtual storage S/370 or 4300 Processor; or via an Integrated Communications Adapter on S/370 processor; or via a Communications Adapter feature on a 4331 or 4361 processor. BSC attachment can be made via a 3704/3705 Communications Controller attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in mdl 65 mode), 75, and 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in mdl 65 mode), 75, and 195; or via an Integrated Communications Attachment on S/360 mdl 25. Note: The 3725 is not connectable to S/360.

HIGHLIGHTS - WITH EMULATOR

- **Dual 256-Byte Buffers:** Transfer data between the input and output devices. The buffers alternate in providing input and output service to permit overlapped operation.
- **Buffer Edit:** Allows corrections to be made on the contents of a buffer during key entry jobs. A 256-byte diskette record, if the diskette feature is present, can also be retrieved into the buffer using Update Mode and be corrected using buffer edit functions. Corrections can be made by character, by line, or by entire buffer (up to 256 bytes).
- **Extend Buffer:** Combines the dual 256-byte buffers into a single 512-byte buffer under operator control for keyboard-to-line or keyboard-to-diskette jobs. Buffer edit capability applies to the full 512 bytes. Buffer transfers to line or diskette are in 256-byte increments and cannot be overlapped.
- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Format controls for up to five jobs can be entered from keyboard, or from diskette or card if either one of these devices is attached.
- **Compression/Expansion:** Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards. A 2-byte sequence is substituted for each occurrence of three or more consecutive blank card columns (63 consecutive blanks is the upper limit).

A second 2-byte sequence is appended if more than 64 consecutive blank columns are read. The terminal monitors the non-transparent data received that is destined for printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks. A similar capability is provided when using SDLC procedures.

- Auto Interrupt: Allows the terminal to automatically interrupt an offline job for an online job initiated by the host processor. The terminal stops the offline job, executes the online job for receiving line data, and automatically restarts the offline job without operator intervention. A manual switch on the keyboard enables/disables this mode of operation. See "Operating Characteristics-Automatic Interrupt in 3770 System Components Manual", GA27-3097.
- Input/Output Job Definitions: Can be operator-or terminal-defined. Up to five operator-defined jobs can be read from diskette or card reader to facilitate rapid job setup when the terminal is equipped with either of the special features; otherwise they can be entered from keyboard under control of a prompting sequence and executed from temporary storage. Printer format controls can be part of the job definition. An appropriately configured 3775 will permit input/output job designations as follows:

Input	Output
Offline Jobs	
Keyboard (1)	Console Printer, Diskette, or Card Punch
Diskette (2)	Console Printer, Diskette, or Card Punch
Card Reader (2)	Console Printer, Diskette, or Card Punch
Keyboard and Diskette (3)	Console Printer and either Diskette or Card Punch
Keyboard and Card Reader (3)	Console Printer and either Diskette or Card Punch
Online Batch Jobs	
Diskette or Card Reader (2)	Line
Line(2)	Console Printer, Diskette, or Card Punch
Online Interactive Jobs	
Keyboard (1)	Line
Line	Console Printer

Notes:

1. One input and one output device per job. Output-to-console printer is automatic when input is keyboard.
2. One input device and one output device per job. Monitor print is an additional output option when Diskette, Card Punch, or Line is the output device.
3. Record Format (#6010) is required in addition to I/O devices to allow multiple input and output devices for a job.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard and console printer are standard. For other configurations, refer to "Special Features" below.

Bibliography: GC20-0001

SPECIFY

- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	220V #2803
220V #2813	
235V #2814	
- Power Cords: One must be specified.
 - #2760 - 50 Hz cord without plug.
 - #2762 - 60 Hz cord without plug.
- Color: One must be specified. #9041 for Red, #9042 for Yellow, #9043 for Blue, #9045 for Gray.

Note: Available at time of manufacture only.
- Remote Power Off (#9501): Specify this feature for capability to "power down" terminal from the host processor using a controlled data sequence sent over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to "Installation Manual-Physical Planning", GA27-3006.
- Machine Nomenclature:
 - #2930 - Japanese

Note: Not recommended for field installation.
- Keyboard Arrangement: One must be specified.
 - #2950 - International
 - #2955 - Japan
 - #2957 - Germany
 - #2958 - English UK
 - #2960 - Spain
 - #2968 - Italy
 - #2969 - Spanish Speaking
 - #2970 - France
 - #2973 - Japan Katakana
 - #2975 - Brazil

Note: Not recommended for field installation.
- Print Belt Character Set: One must be specified. Available at time of manufacture only. See Print Belt under "Accessories" for additional print belts.
 - #2768 for 64-Character Set, 2769 for 94-Character Set. #2873 for 128-Character Set (Japan Katakana - requires #2973).

SPECIAL FEATURES

All special features are on an "as available" basis for field installation, except Keypad feature (#4660) and Dual Independent Forms Feed (#3551) for which field installation is not recommended.

COMMUNICATIONS FEATURES

For communication capability, select one from each group:

- One Communication Feature (#1460, #1461 or #1470)*
- One Communication Driver (#1481 or #1482)

- EIA/CCITT Interface (#3701), X.21 Adapter for Nonswitched Networks (#5655) or One Integrated Modem (#5500, #5600, #5602, or #2881).

* #1482 is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. Limitations: Not with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC, Point-To-Point (#1481): Provides for point-to-point BSC operation over switched or nonswitched facilities. Limitations: Not with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC, Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. Limitations: See GA27-3097 for BSC compatibility considerations. Maximum: One. Prerequisites: #1461 or #1460.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. Maximum: One. Limitations: Not with #1460 or #1461.

Without Business Machine Clocking (#1481): Provides communication driver without clocking. Limitations: Not with #1482. Maximum: One. Prerequisites: #1460, #1461, or #1470.

With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200 bps clocking. Normal/half-speed switch on operator panel allows selection of 1200 or 600 bps operation of the clock. Limitations: Not with #1481. Maximum: One. Prerequisites: Communication Feature #1460, #1461, or #1470.

EIA/CCITT Interface (#3701): Provides a CCITT interface and cable for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds of up to 4800 bps for switched and nonswitched operation are permitted. This feature, in combination with #1481, can be used to attach to Modem Fan-Out (#3901) on an adjacent terminal, or on 3863, 3864, 3872 or 3874 Modem. This feature in combination with #1482 can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. Limitations: Not with Integrated Modem features. Not with X.21 Adapter for Nonswitched Networks (#5655). Maximum: One. Prerequisites: #1481 or #1482. (Japan only > Specify Code #2946 must be supplied to satisfy the NTT's DTE Self-test requirements when attaching a non-IBM modem.<)

Modem Fan-Out (#3901): Equips the 2400 bps Integrated Modem, Nonswitched Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. Limitations: This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. Maximum: One. Prerequisites: #5602.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. Half-speed operation at 600 bps is under manual switch control. Limitations: Not with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1482. (Japan only > also specify #2943 for NTT D-1 Service Connection.<)

2400 bps Integrated Modem, Nonswitched Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. Limitations: Not with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<)

2400 bps Integrated Modem, Nonswitched Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. Limitations: Not with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisite: #1481. (Japan only > Also specify 2943 for NTT D-1 Service Connection.<)

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT X.21 characteristics for attachment of data communication equipment. Feature operates only over Non-Switched lines using SDLC procedures. Speeds of 2400 or 4800 bps are permitted. Limitations: 1) Japan DDC Non-Switched Network only. 2) Not with #3701. 3) Not with Integrated Modem features. Maximum: One. Prerequisites: #1481 and #1470.

NON-COMMUNICATIONS FEATURES

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One.

Door Keylock (#3401): (SUC) Provides one keylock and two keys for the desk-console door. Limitations: The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One.

Door Keylocks, Dual (#3402): (SUC) Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One. Prerequisite: #4902.

Keylock (#4850): (SUC) Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. See "Accessories" for information on additional or replacement keys. Maximum: One.

Diskette Storage, First (#4901): One device with a customer-removable diskette is placed in the left cabinet. Additional diskettes are available. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head, one read/write surface, 73 data tracks, 26 sectors per track, and 128 bytes per sector. Up to 949 256-byte records can be stored on the diskette (one 256-byte data record is reserved for job identification information in 3775). Each 256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode mdl 1. An Update Switch on the 3775 provides the operator with the capability of reading a 256-byte diskette record into the terminal buffer where it can be printed, edited, or deleted. Maximum: One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first (#4901). It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for:

- Copy: Data can be copied from Diskette 1 to Diskette 2 (single data set or all active data sets.)
- Concatenate (pool): The ability to concatenate on a data set basis.
- Continue: Allows a read or write operation to automatically continue to Diskette 2 if it has been placed in a ready condition. Continue is not allowed while keying data.
- Record Update: Allows a record to be read into the buffer from Diskette 1, updated from keyboard, and written to the other diskette.
- Record Format (#6010): Prerequisite for this update capability.

Maximum: One. Field Installation: Yes. Color will be the same as that specified for the base machine. Prerequisite: #4901.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 inches x 2-1/8 inches ranging from 0.007 to 0.045 inches thick may be read. Contact IBM for magnetically striped and encoded identification cards. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. Limitations: (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 does not support this feature. Maximum: One.

Record Format (#6010): Provides an offline capability for constructing records using more than one input and output device. Input can be keyboard, and either diskette or an attached card reader. Output can be console printer, and either diskette or an attached card punch. A record format specification record stored on diskette can be defined and changed by the user to permit selection, by field, for merging or creating, in any sequence within a transaction cycle. It also permits selecting output by field. There may be multiple fields within a transaction and multiple transaction cycles within a job. Provision is also made with this feature for self-checking, decimal insertion, right justify and fill, and numeric checking. A record format specification record can be loaded to diskette from the line, keyboard, or card reader. This feature increases the size of "extend buffer" from 512 to 2,048 bytes. Limitations: Extend buffer and update operation is not permitted for a record format job. A record format job cannot be interrupted by the processor automatically; operator intervention is required. Maximum: One. Prerequisite: #4901.

3501 Card Reader Attachment (#8050): Provides for attachment of the 3501 Card Reader. Limitations: Not with 3782/2502 Card Reader Attachment (#8149). Maximum: One.

3782/2502 Card Reader Attachment (#8149): Provides for the attachment of the 3782 Card Attachment Unit mdl 2 and 2502 Card Reader mdl A1 or A2. The 2502 can be equipped with special features for 51/80 or 66/80 column cards and/or is required on the #3782 mdl 2. Limitations: Not with 3501 Card Reader Attachment (#8050). Maximum: One.

3782/3521 Card Punch Attachment (#8150): Provides for attachment of the 3782 Card Attachment Unit mdl 1 and the 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print or Card Print Katakana. Limitations: If a 2502 or 3501 Card Reader is also attached (#8149 or #8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Accessories are available on a purchase-only basis. For shipment with machine, order feature numbers indicated below.

Forms Stand (#4450): A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. For shipment with the machine, order by feature number. Note: For the 3775, it is recommended that forms be used out of carton.

Locks and Keys: The Keylock #4850 special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

Print Belt: A metal belt with engraved font. Available in EBCDIC character arrangement for the countries listed in the table below. Character set sizes of 64 or 94 (96 positions of which 94 are printable) are available. See "Specify" for restrictions or limitations. The belt can be interchangeably used with the one provided on the machine. Order must contain two feature numbers, one from Table A and one from Table B.

Table A - Character Set Size

#2798	-	64-character set
#2799	-	94-character set

Table B - Country Arrangement

#2975 - Brazil	#2968 - Italy
#2977 - Canada (French)	#2955 - Japan (English)
#2956 - English US	#2973 - Japan (Katakana)
#2958 - English UK	#2960 - Spain
#2970 - France	#2969 - Spanish Speaking
#2957 - Germany	#2953 - Text Print EBCDIC
#2950 - International	(English US only)

SUPPLIES

Ribbons: A black ribbon, P/N 1136634 (No Longer Available) , or equivalent, is required. Contact IBM.

3776 COMMUNICATION TERMINAL MODELS 1, 2

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 3776 is a medium-speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776 mdls 1 and 2 are SNA Single Logical Unit (SLU) and BSC terminals. A keyboard is used for terminal control and for operator communication with the host processor. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, 94 or 127-character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 50, 150 or 300 cards per minute. The card punch operates at 50 cpm.

Communication features permit operation over switched or non-switched facilities at speeds up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS 1, 2

Model 1 001

Maximum LPM	Character Set
300	48
230	64
160	94
80	127 Katakana

Model 2 002

Maximum LPM	Character Set
400	48
300	64
230	94
160	127 Katakana

Prerequisites:

For SDLC Communications with S/370, 4331 or 4341 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or these operating systems running under VM/370.

For BSC Communications with S/360, S370 or 4300 Processor: A virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or under RSCS and VM/370; or any of these operating systems running under VM/370. The 3776 Communication Terminals use 2770/3780 BSC programming support when operating in BSC mode. Operation with S/360, S/370 or 4300 Processors using 2770/3780 BSC programming is also permitted. See GA27-3097 for BSC compatibility considerations. The customer may have to modify existing 2770/3780 application programs for operation with 3776. BSC attachment can be via a 3704, 3705, or 3725 Communications Controller, or a 2701 Data Adapter Unit attached to a channel of any S/370, 4331, 4341 or 4381 Processor; or via an Integrated Communications Adapter on S/370 mdl 115, 125, 135-3 or 138; or via a Communications Adapter feature on the 4331 or 4361 Processor. BSC attachment can be made via a 3704/3705 attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75 or 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40 44, 50, 65, 67 (in 65 mode), 75 or 195; or via an Integrated Communications Attachment on S/360 mdl 25. Note: The 3725 is not connectable to S/360.

For BSC Communications with System/38: All mdls of S/38 running under CPF (5714-SS1) featured with Communications Attachment

(#1501 or #1502) and Communications Control, SDLC/BSC (#2001 or #2003). See "IBM System/38 Data Communications Programmer's Guide", SC21-7825, for BSC function and compatibility considerations.

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard and printer are standard. For other configurations, refer to "Special Features" below.

HIGHLIGHTS

- **Keyboard:** (Canada only) EBCDIC arrangement with 44 data keys (produces 88 characters). (Except Japan Katakana and Canada) use EBCDIC arrangement with 47 data keys (produces 94 characters). (Less) Underscore/Hyphen, Backspace, Space, and Character Advance keys have typamatic operation. Japan Katakana uses 48 keys in EBCDIC arrangement (produces 127 characters). The Japan Katakana keyboard provides typamatic operation for Backspace, Space, Tab, New Line, and Character Advance. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.
- **Printer:** Line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, 94- or 127-character set) -- see "Specify" -- variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3488 for forms design considerations.
- **Buffers:** Transfer data between the input and output devices and the communication line. Buffers also transfer data between input and output devices during offline operation. The buffers alternate in providing input and output service to permit overlapped operation. Dual 256-byte or dual 512-byte buffers are used to BSC or SDLC operation and are under operator control.
- **Printer Format Controls:** Facilitate the formatting or printed data. Vertical and horizontal control characters in data initiate vertical and horizontal tabbing.
- **Compression/Expansion:** Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards or diskette. A 2-byte sequence is substituted for each occurrence or three or more consecutive blanks (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 63 consecutive blanks are read. The terminal monitors received non-transparent data that is destined for the printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks.
- **SDLC implementation provides a compression option at the terminal for a job that reads data from cards or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.**
- **Transmission Reversal:** Permits keyboard initiation of interrupt of host data transmission for terminal data transmission and for resumption of the host transmission upon completion of the terminal transmission. The function is dependent upon associated host programming.
- **Record Compress:** Using two special feature diskette storage devices permits offline compression of Basic Exchange diskette records onto a single 3776 diskette for subsequent batch transmission. The compressed records are written on

the 3776 diskette in 3770 mode. Record Compress using one diskette storage device permits the compression of Basic Exchange diskette records into blocks of 256 bytes of 512 bytes for transmission.

- **Dual Data Path:** Provides for concurrent operation of a line-to-printer job and a card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette job. The line-to-printer job uses either the dual 256-byte or dual 512-byte alternating buffers to accept data from the line and transfer it to the printer. A single 256-byte or single 512-byte buffer is used for data buffering between card I/O and diskette or diskette and diskette. Throughput for both online and off-line jobs is degraded when run concurrently using dual data path.
- **Automatic Card to Line Job:** When an online job is completed and the 3776 goes into Standby Status, a reader-to-line job is automatically started. The Start-Job procedure is not required provided the terminal has a 2502 Card Reader and it is in Ready Status.
- **Input/Output Form Definitions:** Can be operator- or terminal-defined. Up to five operator-defined forms can be read from diskette or card reader to facilitate rapid job setup when the terminal is equipped with either of the special features; otherwise they can be entered from the keyboard. Printer format controls can be part of the job definition. An appropriately configured 3776 will permit input/output job designations as follows:

Input	Output
Offline Jobs	
Diskette(1)	Printer, Diskette or Card Punch
Card Reader(1)	Printer, Diskette or Card Punch

Online Batch Jobs

Diskette or Card Reader(1)	Line
Line(1)	Printer, Diskette or Card Punch

Dual Data Path Jobs

Line(2)	Printer
Card Reader(2)	Diskette
Diskette(2)	Card Punch
Diskette(2)	Diskette

1. One input device and one output device per job.
2. Line-to-printer occurs concurrently with card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printer, forms skipping, application processing, etc., must all be considered in determining actual throughput. See "IBM 3770 Data Communication System", GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See "IBM 3776 Operating Procedures Guide", GA27-3107.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out

the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features". Transmission speeds up to 4800 bps over switched or nonswitched facilities are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information. Also refer to M3863, 3684, 3868 and 3872 pages. The 2400 bps Integrated Modem and 3872 Modem when appropriately configured can be intermixed on the same communication facility. (Japan only> NTT and other non-IBM modems can be attached via the CCITT feature.<)

Bibliography: GC20-0001

SPECIFY

- (Canada only> Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug.<)
- **Power (AC, 1-phase):** One must be specified. Note: Not recommended for field installation.

50 Hz		60 Hz	
100V	#2804	100V	#2730
110V	#2805	115V	#9901
123.5V	#2811	200V	#2732
200V	#2806	220V	#2803
220V	#2813		
235V	#2814		

- **Power Cords:** One must be specified. Note: Not recommended for field installation.

59 Hz cord without plug (#2760)
60 Hz cord without plug (#2762)

- **Color Group:** One only must be specified. Available at time of manufacture only. #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray.
- **Language Group:** One must be specified. Note: Not recommended for field installation.

English	#2927
Italian	#2932
French	#2928
German	#2929
Japanese	#2930
Spanish	#2931

- **Keyboard Arrangement:** One must be specified. Note: Not recommended for field installation except for International (#2950) which may be field installed. International (#2950) is required if #2766 - 48-character set EBCDIC (HN Character Set) is specified at time of manufacture. International (#2950) may not be field removed. Also see Print Belt, Add'l, in "Accessories".

Brazilian	#2975	Japanese	#2955
English UK	#2958	Japan Katakana	#2973
Finnish	#2963	Portuguese	#2959
French	#2970	Spanish	#2960
German	#2957	Span Speak	#2969
Int'l	#2950		
Italian	#2968		

- **Print Belt Character Set:** Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine. See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry.

(Canada only> #9489 -- 48-character set EBCDIC (HN Character Set)*
#9490 48-character set EBCDIC (Standard Character Set)*

#9491 64-character EBCDIC
#9492 94-character set EBCDIC
#9493 48-character set ASCII**
#9494 64-character set ASCII**
#9495 94-character set ASCII**<)

(Except Canada > #2766 -- 48-character set EBCDIC (HN Character Set)* ***
#2767 48-character set EBCDIC (Standard Character Set)*
#2768 64-character set EBCDIC<)

#2873 127-character set, Japan Katakana****

* These belts are identical except for the special character differences:

HN Character Set has:) (=
Standard Character Set has: % # @

(Canada only > ** ASCII Feature (#1201) is required.<)

(Except Canada > *** International Keyboard Arrangement (#2950) required.<)

**** #2873 requires #2973. The Japan 48- or 64-character Print Belts (see "Accessories") can be used interchangeably with the 127-character Katakana print belt when #2873 is specified.

Print Belts are interchangeable by the operator. The internal code structure adapts to the belt installed as follows:

HN Character Set Specified	Data Stream Char	Printed Char
HN Belt Installed) (=) (=
HN Belt Installed	% # @) (=
Std Belt Installed) (=	% # @
Std Belt Installed	% # @	% # @
Std Character Set Specified		
Std Belt Installed	% # @	% # @
Std Belt Installed) (=	- - -
HN Belt Installed	% # @) (=
HN Belt Installed) (=	- - -

- Cabling: Fixed-length cables are supplied as standard. Refer to "Installation Manual - Physical Planning", GA27-3006.
- Remote Power Off (#9501): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.

MODEL CONVERSIONS

Changes from model 1 to model 2, 3 or 4 and from model 2 to model 4 are field installable. Note: Customer price quotations and customer order acknowledgment letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM".

SPECIAL FEATURES

(Except Canada > All special features can be field installed.<)

(Canada only > All special features can be field installed, except #1201 for which field installation is not recommended.<)

For Communication Capability: Select one Communication Feature (#1460, #1461 or #1470); a Communication Driver (#1481); one Integrated Modem (Canada only > (#5600, #5602, #5610, #5700, #5702, #5710) or EIA <) (#2881, #5600, #5602, #5700, #5702) or CCITT Interface (#3701). X.21 Adapter for Nonswitched Networks (#5655). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

(Canada only > ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette) and with BSC features #1460, #1461 or #1462 or with SDLC features #1460 or #1470. Maximum: One Field Installation: Not recommended. Specify: Orders for #1201 must also specify one print belt, #9493 for 48-character ASCII, #9494 for 64-character ASCII, or #9495 for 94-character ASCII.<)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. Limitations: Cannot be installed with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC, Point To Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. Limitations: Cannot be installed with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. Limitations: See GA27-3097 for BSC compatibility considerations. Maximum: One. Prerequisites: #1460 or #1461.

SDLC (#1470): Provides for switched or nonswitched SDLC procedures. (Canada only > For record purposes, also identify the primary CPU/Program Environment code. Specify one of the following: #9977 for DOS/VS VTAM, #9988 for OS/VS1 VTAM, #9989 for OS/VS2 VTAM, or #9993 for all other combinations of operating systems and access methods.<) Limitations: Cannot be installed with #1460 or #1461. Maximum: One.

Communication Driver Without Business Machine Clocking (#1481): Provides communication driver without clocking. Maximum: One. Prerequisites: #1460, #1461 or #1470. 2400 bps Integrated Modem, Switched, Caducee Network (#2881)

This self-clocked modem provides for point-to-point operation over the Caducee switched network. Operator controls provide for half-speed operation and Talk/Data. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitations: The keys provided for this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with these locks can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One. Prerequisites: Diskette Storage, 2nd (#4902).

(Canada only > EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds up to 4800 bps for switched or nonswitched operation are

permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3902) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. Limitations: Cannot be installed with any Integrated Modem Feature. Maximum: One. Prerequisites: #1481.<

(Except Canada > CCITT Interface (#3701): Provides a CCITT interface and cable for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds of up to 4800 bps for switched and nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3902) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. Limitations: Cannot be installed with any Integrated Modem feature.<) Not with X.21 Adapter for Nonswitched Networks (#5655). Maximum: One. Prerequisites: #1481.

(Japan Only > Specify: #2946 for NTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy.<)

Modem Fan-Out (#3901): Equips the 2400 bps Integrated Modem, Nonswitched, Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. Limitations: This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. Maximum: One. Prerequisites: #5602.

Modem Fan-Out (#3902): Equips the 4800 bps Integrated Modem, Nonswitched, Multipoint (#5702) with the capability to be shared by up to two other terminals in addition to the terminal containing the integrated modem. Limitations: This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. Maximum: One. Prerequisites: #5702.

Forms Stand: Integrated into the machine covers for the 3776 mdl 1 and 2.

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. Maximum: One.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left cabinet. Additional diskettes are available from IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 949 256-byte records or up to 474 512-byte records can be stored on the diskette (one 256-byte data record is reserved for forms control information). Each 256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Each 512-byte record is stored in four consecutive sectors in interchange mode, or four non-consecutive sectors in 3770 mode. Diskette data is code insensitive in SDLC mode, non-transparent only in BSC mode. Maximum: One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. *The second diskette allows additional capabilities for: Copy - data can be copied from Diskette 1 to Diskette 2 (single data set or all active data sets - 3770 mode only) - Concatenate (pool) - the ability to concatenate on a data set basis - Continue - allows a read or write operation

to automatically continue to Diskette 2 if it has been placed in a Ready condition. Maximum: One. Prerequisites: #4901. Orders for field installation must specify color - #9081 for red, #9082 for yellow, #9083 for blue, or #9085 for gray. Color must be the same as that specified for the base machine.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8" ranging from 0.007" to 0.045" thick may be read. See "NDD-SS Sales Manual" for magnetically striped and encoded identification cards. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. Limitations: The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. BSC programming for 2770 and 3780 does not support this feature. Maximum: One.

2400 bps Integrated Modem, Nonswitched, Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. For Japan only: Also specify #2943 for NTT D-1 Service Connection.

2400 bps Integrated Modem, Nonswitched, Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<) (Canada only > 2400 bps Integrated Modem Switched, With Auto Answer (#5610)

This self-clocked modem provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Operator controls provide for half-speed operation. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.<)

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT X.21 characteristics for attachment of data communication equipment. Feature operates only over nonswitched lines using SDLC procedures. Speeds of 2400 or 4800 bps are permitted. Limitations: 1) Japan DDC nonswitched Network only. 2) Not with #3701. 3) Not with Integrated Modem features. Maximum: One. Prerequisites: #1470, #1481. Specify: (Record purposes only) #9822 for 2400 bps, #9823 for 4800 bps.

4800 bps Integrated Modem, Nonswitched, Point-To-Point (#5700): This self-clocked modem provides for point-to-point operation over 4-wire nonswitched communication facilities. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<)

4800 bps Integrated Modem, Nonswitched, Multipoint (#5702): This self-clocked modem provides for multipoint operation over 4-wire nonswitched communication facilities. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<)

(Canada only > 4800 bps Integrated Modem, Switched, With Auto Answer (#5710): This self-clocked modem provides for point-to-point operation over switched network facility using manual originate/auto answer for establishing connection. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481.<) (Canada only > Note: Attachment to the switched telephone network is via

common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

(Canada only > Switched Network Backup (#7951): Provides the capability of attaching 2400 bps Integrated Modem (#5600 or #5602) to the switched network facility as a backup to the primary non-switched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 2400/1200 bps with an IBM 3872 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. Note: To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required at the using system. This feature can be used with BTAM programs for DOS/VS, OS/VS1 and OS/VS2 in certain configurations. Additional customer program routines will be required in existing BTAM programming to fully utilize the capabilities of this feature. Limitations: Cannot be installed with #3701. Maximum: One. Prerequisites: 2400 bps Integrated Modem (#5600 or #5602). <)

(Canada only > Note: Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

(Canada only > Switched Network Backup (#7952): Provides the capability of attaching 4800 bps Integrated Modem (#5700 or 5702) to the switched network facility as a backup to the primary non-switched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 4800/2400 bps with an IBM 3874 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. Note: To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required on the using system. Additional customer program routines will be required in existing programming to fully utilize the capabilities of this feature. Limitations: Cannot be installed with #3701. Maximum: One. Prerequisites: #5700 or #5702. <)

(Canada only > Note: Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

3501 Card Reader Attachment (#8050): To attach a 3501 Card Reader. Limitations: Cannot be installed with #8149. If a 3521 is also attached (#8150), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

3782/2502 Card Reader Attachment (#8149): To attach a 3782 Card Attachment Unit mdl 2 and a 2502 Card Reader mdl A1 or A2. Limitations: Cannot be installed with #8050. If a 3521 is also attached via #8150, the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check, Card Print or Card Print Katakana. Limitations: If a 2502 or 3501 Card Reader is also attached (#8149 or 8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt: A metal belt with engraved font. Available in EBCDIC character arrangement for the countries listed in the table below. Character set sizes of 64 or 94 (96 positions of which 94 are printable) are available. See "Specify" for restrictions or limitations. The belt can be interchangeably used with the one provided on the machine. Order must contain two feature numbers, one from Table A and one from Table B.

Table A - Character Set Size

#2796	48-character set (HN Character Set)*
#2797	48-character set (Standard Set)
#2798	64-character set
#2799	94-character set
#5831	96-character Courier (WP-EBCDIC)
#5832	96-character Artisan (WP-EBCDIC)
#5833	128 character DP and WP) (EBCDIC)

Table B - Country Arrangement

#2975	Brazil**	#2968	Italy
#2977	Canada (Fr.)**	#2955	Japan (Eng.)**
#2956	English US	#2973	Japan (Kata.)
#2958	English UK	#2960	Spain
#2970	France	#2969	Span. Speak**
#2957	Germany	#2953	Text Print
#2950	Int'l * **		EBCDIC (English US only)

* Country Arrangement International (#2950) must be used with 48-Character set (#2796) (HN Character Set).

** Not available with #5831, #5832 or #5833.

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. Note: Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670 (No Longer Available), or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3776 COMMUNICATION TERMINAL MODELS 3, 4

PURPOSE

The 3776 is a medium speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776-3 and 3776-4 are SNA Multiple Logical Unit (MLU) terminals. A keyboard and a console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal set-ups and local utility programs in terminal storage for use by the terminal operator. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, 94-, or 127-character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operates at 50 cpm.

MODELS 3, 4

Model 3 003

Maximum LPM	Character Set
300	48
230	64
160	94
80	127 Katakana

Model 4 004

Maximum LPM	Character Set
400	48
300	64
230	94
160	127 Katakana

Limitations: The input/output capabilities outlined under "High-lights" are dependent on appropriate configurations of the terminal. Keyboard, console display, terminal storage and printer are standard. One communications feature (#3701, #4501, #5605 or #5651) is required. For other configurations, refer to "Special Features" below. The duplex data communications capability of the 3776-3, -4, 3777-3 is operational on nonswitched full-duplex communications facilities only.

Prerequisites for SDLC Communications with S/370 or 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370, 4331 or 4341 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, POWER/VS or VTAM. An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for Duplex data stream operation.

HIGHLIGHTS

- Keyboard: EBCDIC arrangement with (Canada only >44<) (Except Canada >47<) data keys for all counties except Japan (Katakana). Japan Katakana uses 48 data keys. The keyboard, in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display, provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Advance are

non-destructive. Character Advance is typematic. Reset returns to the position from which the Character Backspace began.

- Console Display: Contains 16 lines of 64 characters each for a total of 1024 characters. The 3776-3 and 3776-4 reserve the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input. Lower case alphabets are converted to upper case before displaying. Katakana machines provide for upper case Katakana characters only. When the cursor is beneath a character, any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted. Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time, the operator is prompted to specify date and time. As messages are received, they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the Greater Than sign in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state, a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

- Printer: Line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, 94- or 127-character set) -- see "Specify". Also standard are a variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3844 for forms design considerations.
- Forms Stand: Is integrated into the machine covers for the 3776 mdl 3 and 4.
- Terminal Storage: Is standard for message spooling, terminal control, utility programs and user-generated procedures.
- Diskette Storage: There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3776-1 and 3776-2, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used locally for input or output. Diskette operation is concurrent with other terminal functions.
- Magnetic Tape: May be used as either an input or as an output device. One 3411-1 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411-1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. 7-track tape operation is not provided. The 3411-1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed or variable length and may be unblocked or blocked to a maximum block size of 4000 bytes. Maximum record size is 255 bytes. A block size of up to 2000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal

functions. Refer to G232-0004 for detailed information on operation of the 3411-1. Refer to M3411 for ordering information. Feature #7003 is required on the 3411 mdl 1.

- **Buffers:** Transfer data between the input and output devices and the communication line. SDLC communications uses a customer-defined Request/Response Unit (RU) of 256 or 512 byte buffer. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. Buffers also transfer data between input and output devices during local operation.
- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical control characters in data initiate vertical tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.
- **Compression/Expansion:** Implementation provides a compression option at the terminal for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.
- **Decompression:** Provides the decompression function associated with the receipt of a compacted data stream whereby a pair of consecutive alphanumeric characters is represented by a single transmission byte. Function depends upon transmission by the host of a decompression table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompression occurs for data directed to the printer, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided.
- **Automatic Card Reading:** Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.
- **Job Control:** Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local utility jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printer, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printer, Diskette, Card Punch
Diskette	Printer, Magnetic Tape, Diskette, Card Punch

- **Record Formats:** Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape data sets, are also applicable to diskette as a function of Basic Exchange data sets (128 byte maximum).

Basic Exchange diskettes may be read by the terminal. Basic Exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 120 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

- **Remote Power Off:** See #9501 under "Specify" below.
- **Encrypt/Decrypt Feature:** Available to provide secure data transmission in conjunction with ACF VTAM Encrypt/Decrypt Feature (Program Number 5735-RC2) (Feature Number 6010) and Programmed Cryptographic Facility Program Product (Program Number 5740-XY5).

Performance Considerations: The line-to-printer performance of the 3776-3 is up to 300 lpm with a 48-character set print belt. The line-to-printer performance of the 3776-4 is up to 400 lpm with a 48-character set print belt.

The 3776-3 and 3776-4 MLU terminals will operate, however, with concurrent input-output processing in either a Duplex or Half Duplex data communications mode as a function of the base Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations. The degree of degradation which may occur will tend to be greater when Half Duplex communications are employed as opposed to Duplex communications and system facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, SNA pacing, cryptographic processing, etc., must all be considered in determining actual throughput.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half Duplex communications mode. The 3776-3 or 3776-4 operating Duplex at (Canada only > 19.2K bps <) (Except Canada > 20.4K bps <) on a terrestrial link may, however, present a variance of from greater to degrade overall terminal throughput when compared to comparable operation in a half-duplex mode.

Problem Determination Procedures: Function has been designed into this unit to help provide availability to the customer. See "IBM 3770 Multiple Logical Unit Operator's Guide for 3776-3, 3776-4, 3777-3", GA27-3125.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features" -- Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps. Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above (Canada only > 4800 <) (Except Canada > 9600 <) bps are on nonswitched facilities. Direct local attachment to 3705-II at 1.4K bps or a 3725 at 19.2K bps. EBCDIC is the standard transmission code. (Canada only > ASCII is available as a special feature. <) Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

Modem	Speed (bps)	Lines

SPECIFY

- (Canada only) > Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug. See M3411 for Magnetic Tape Unit voltage requirements. <)
- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V (#2730)
110V #2805	115V (#9901)
123.5V #2811	200V (#2732)
200V #2806	220V (#2803)
220V #2813	
235V #2814	

See M3411 for Magnetic Tape Unit power requirements.

- Power Cords: One must be specified.
50 Hz cord without plug (#2760)
60 Hz cord without plug (#2762)
- Color Group: Blue is supplied as standard except for field model conversions where installed color groups will be matched (do not specify).
- Language Group: One must be specified. Note: Not recommended for field installation.
English #2927 Italian #2932
French #2928 Japanese #2930
German #2929 Spanish #2931
- Keyboard Arrangement: One must be specified. Note: Not recommended for field installation except for International (#2950) which may be field installed. International (#2950) is required if #2766 - 48-character set EBCDIC (HN Character Set) is specified at time of manufacture. International (#2950) may not be field removed. Also see "Print Belt, Add'l" in "Accessories".
Brazilian #2975 Japanese #2955
English UK #2958 Japanese #2955
French #2970 Katakana #2973
German #2957 Portuguese #2959
Int'l #2950 Spanish #2960
Italian #2968 Span Speak #2969
- Print Belt Character Set: Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine). See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry.

- Cabling: Fixed-length cables except for 3411 Magnetic Tape and Control are supplied as standard. Refer to "Installation Manual - Physical Planning", GA27-3006. 3411 cables must be separately ordered.
- Remote Power Off (#9501): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.
- (Canada only>EIA RS-232C 19.2K bps Line Speed: #9481 -- provides support of 19.2K bps. <)
- (Canada only>Alternate Address (#9011): (For record purposes only) Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by<) (Canada only>CE<) (Canada only>using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location.<)

SPECIAL FEATURES

All special features can be field installed. (Canada only>Field installation is not recommended for feature #1201.<)

(Canada only>ASCII Feature (#1201): A 48-data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). Maximum: One. Field Installation: Not recommended. Specify: Orders for #1201 must also specify one print belt, #9493 for 48-character ASCII, #9494 for 64-character ASCII, or #9495 for 94-character ASCII.<)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One.

CCITT-V35 Interface (#2911): Provides a cable and interface compatible with CCITT-V35 recommendations for attachment of data communication equipment (see M2700 pages). Speed of (Canada only>19.2K bps<) (Except Canada>20.4K bps<) is permitted.

(Canada only>See the IBM Canada Data Communications Handbook for information.<) Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with a maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150.0m (491 ft). Limitations: Cannot be installed with #3701, #4501 or #5655. Maximum: One.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitations: The keys provided for this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with these locks can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One. Prerequisites: #4902.

Encrypt/Decrypt (#3680): Provides cryptographic data transmission in conjunction with program support in the host. Includes a security keylock. Each machine will have its own unique key. Two identical keys are supplied with the feature. Maximum: One. Prerequisites: A mercury battery, IBM P/N 1743456 or equivalent is required. A battery is shipped with this feature. See "Accessories" for additional or replacement battery. Replacement of the discharged battery is the customer's responsibility.

(Canada only>EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. Limitations: Cannot be installed with DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multipoint (#5651), High-Speed Digital Interface (#4501), or V35 Interface (#4720). Maximum: One. Prerequisites: For 19.2K bps operation, #9481 is required -- see "Specify".<)

(Except Canada>CCITT-V24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 Pages). Other external non-IBM modems may be attached subject to the Multiple System Supplier Bulletin. Speeds from 2400 bps to 9600 bps are permitted.

Limitations: Cannot be installed with<) (Except Canada>#4501 or #2911.<) #4501, #2911 or #5655. (Except Canada>Maximum: One.<) (Japan only>Specify: #2946 for NTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy.<)

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

High-Speed Digital Interface (#4501): Provides a cable and interface for attachment to a modem which permits point-to-point and multipoint synchronous operation at (Canada only>19.2K<) (Except Canada>20.4K<) bps on a broadband channel. Limitations: Cannot be installed with #3701, #2911, or #5655. Maximum: One.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to keyboard control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. Maximum: One.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left desk cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange data set or in a 3770 format data set. Diskette capabilities allow for: Concatenate (pool) - the ability to concatenate on a data set basis -- Multivolume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive. Maximum: One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Copy - data can be copied from Diskette 1 to Diskette 2. Maximum: One. Prerequisites: #4901.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus

odd parity. Card size 3-3/8" x 2-1/8" ranging from 0.007" to 0.045" thick may be read. Data read from the magnetic stripe card cannot be printed or displayed. Limitations: The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. Maximum: One.

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT X.21 characteristics for attachment of data communication equipment. Feature operates only over non-switched lines using SDLC procedures. Speeds of 2400, 4800 or 9600 bps are permitted. Limitations: 1) Japan DDC nonswitched Network only, 2) Not with #3701, #2911 or #4501. Maximum: One. Specify: (Record purposes only) #9822 for 2400 bps, #9823 for 4800 bps, or #9825 for 9600 bps.

3411 Magnetic Tape Unit And Control Mdl 1 Attachment (#7801): To attach one 3411 Magnetic Tape Unit and Control mdl 1. Maximum: One. Prerequisites: #7003 on the 3411-1.

3782/2502 Card Reader Attachment (#8149): To attach a 3782 Card Attachment Unit Mdl 2 and a 2502 Card Reader Mdl A1, A2, or A3. Limitations: OMR is not supported. Maximum: One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. Limitations: The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

MODEL CONVERSIONS

Changes from model 3 to model 4 are field installable.

Note: Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM."

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt: A metal belt with engraved font. Available in EBCDIC character arrangement for the countries listed in the table below. Character set sizes of 64 or 94 (96 positions of which 94 are printable) are available. See "Specify" for restrictions or limitations. The belt can be interchangeably used with the one provided on the machine.

Order must contain two feature numbers, one from Table A and one from Table B.

Table A - Character Set Size

#2796	48-character set (HN Character Set)*
#2797	48-character set (Standard Set)
#2798	64-character set
#2799	94-character set
#5831	96-character Courier (WP-EBCDIC)
#5832	96-character Artisan (WP-EBCDIC)
#5833	128-character DP and WP (EBCDIC)

Table B - Country Arrangement

#2975	Brazil**	#2968	Italy
#2977	Canada Fr.**	#2955	Japan Eng.**
#2956	English US	#2973	Japan Katakana
#2958	English UK	#2960	Spain
#2970	France	#2969	Span Speak**
#2957	Germany	#2953	Text Print -
#2950	Int'l* **		EBCDIC-English
			US only

* Country Arrangement International (#2950) must be used with 48-Character set (#2796) (HN Character Set).

** Not available with #5831, #5832 or #5833.

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. Note: Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670 (No Longer Available), or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3776 COMMUNICATION TERMINAL MODELS 1, 2

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 3776 is a medium-speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776 mdls 1 and 2 are SNA Single Logical Unit (SLU) and BSC terminals. A keyboard is used for terminal control and for operator communication with the host processor. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, 94 or 127-character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 50, 150 or 300 cards per minute. The card punch operates at 50 cpm.

Communication features permit operation over switched or non-switched facilities at speeds up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS 1, 2

Model 1 001

Maximum LPM	Character Set
300	48
230	64
160	94
80	127 Katakana

Model 2 002

Maximum LPM	Character Set
400	48
300	64
230	94
160	127 Katakana

Prerequisites:

For SDLC Communications with S/370, 4331 or 4341 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or these operating systems running under VM/370.

For BSC Communications with S/360, S370 or 4300 Processor: A virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or under RSCS and VM/370; or any of these operating systems running under VM/370. The 3776 Communication Terminals use 2770/3780 BSC programming support when operating in BSC mode. Operation with S/360, S/370 or 4300 Processors using 2770/3780 BSC programming is also permitted. See GA27-3097 for BSC compatibility considerations. The customer may have to modify existing 2770/3780 application programs for operation with 3776. BSC attachment can be via a 3704, 3705, or 3725 Communications Controller, or a 2701 Data Adapter Unit attached to a channel of any S/370, 4331, 4341 or 4381 Processor; or via an Integrated Communications Adapter on S/370 mdl 115, 125, 135-3 or 138; or via a Communications Adapter feature on the 4331 or 4361 Processor. BSC attachment can be made via a 3704/3705 attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75 or 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40 44, 50, 65, 67 (in 65 mode), 75 or 195; or via an Integrated Communications Attachment on S/360 mdl 25. Note: The 3725 is not connectable to S/360.

For BSC Communications with System/38: All mdls of S/38 running under CPF (5714-SS1) featured with Communications Attachment

(#1501 or #1502) and Communications Control, SDLC/BSC (#2001 or #2003). See "IBM System/38 Data Communications Programmer's Guide", SC21-7825, for BSC function and compatibility considerations.

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard and printer are standard. For other configurations, refer to "Special Features" below.

HIGHLIGHTS

- **Keyboard:** (Canada only) EBCDIC arrangement with 44 data keys (produces 88 characters). (Except Japan Katakana and Canada) use EBCDIC arrangement with 47 data keys (produces 94 characters). (Less) Underscore/Hyphen, Backspace, Space, and Character Advance keys have typamatic operation. Japan Katakana uses 48 keys in EBCDIC arrangement (produces 127 characters). The Japan Katakana keyboard provides typamatic operation for Backspace, Space, Tab, New Line, and Character Advance. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.
- **Printer:** Line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, 94- or 127-character set) -- see "Specify" -- variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3488 for forms design considerations.
- **Buffers:** Transfer data between the input and output devices and the communication line. Buffers also transfer data between input and output devices during offline operation. The buffers alternate in providing input and output service to permit overlapped operation. Dual 256-byte or dual 512-byte buffers are used to BSC or SDLC operation and are under operator control.
- **Printer Format Controls:** Facilitate the formatting or printed data. Vertical and horizontal control characters in data initiate vertical and horizontal tabbing.
- **Compression/Expansion:** Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards or diskette. A 2-byte sequence is substituted for each occurrence or three or more consecutive blanks (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 63 consecutive blanks are read. The terminal monitors received non-transparent data that is destined for the printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks.
- **SDLC implementation** provides a compression option at the terminal for a job that reads data from cards or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.
- **Transmission Reversal:** Permits keyboard initiation of interrupt of host data transmission for terminal data transmission and for resumption of the host transmission upon completion of the terminal transmission. The function is dependent upon associated host programming.
- **Record Compress:** Using two special feature diskette storage devices permits offline compression of Basic Exchange diskette records onto a single 3776 diskette for subsequent batch transmission. The compressed records are written on

the 3776 diskette in 3770 mode. Record Compress using one diskette storage device permits the compression of Basic Exchange diskette records into blocks of 256 bytes of 512 bytes for transmission.

- **Dual Data Path:** Provides for concurrent operation of a line-to-printer job and a card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette job. The line-to-printer job uses either the dual 256-byte or dual 512-byte alternating buffers to accept data from the line and transfer it to the printer. A single 256-byte or single 512-byte buffer is used for data buffering between card I/O and diskette or diskette and diskette. Throughput for both online and offline jobs is degraded when run concurrently using dual data path.
- **Automatic Card to Line Job:** When an online job is completed and the 3776 goes into Standby Status, a reader-to-line job is automatically started. The Start-Job procedure is not required provided the terminal has a 2502 Card Reader and it is in Ready Status.
- **Input/Output Form Definitions:** Can be operator- or terminal-defined. Up to five operator-defined forms can be read from diskette or card reader to facilitate rapid job setup when the terminal is equipped with either of the special features; otherwise they can be entered from the keyboard. Printer format controls can be part of the job definition. An appropriately configured 3776 will permit input/output job designations as follows:

Input	Output
	Offline Jobs
Diskette(1)	Printer, Diskette or Card Punch
Card Reader(1)	Printer, Diskette or Card Punch

Online Batch Jobs

Diskette or Card Reader(1)	Line
Line(1)	Printer, Diskette or Card Punch

Dual Data Path Jobs

Line(2)	Printer
Card Reader(2)	Diskette
Diskette(2)	Card Punch
Diskette(2)	Diskette

1. One input device and one output device per job.
2. Line-to-printer occurs concurrently with card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printer, forms skipping, application processing, etc., must all be considered in determining actual throughput. See "IBM 3770 Data Communication System", GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See "IBM 3776 Operating Procedures Guide", GA27-3107.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out

the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features". Transmission speeds up to 4800 bps over switched or nonswitched facilities are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information. Also refer to M3863, 3684, 3868 and 3872 pages. The 2400 bps Integrated Modem and 3872 Modem when appropriately configured can be intermixed on the same communication facility. (Japan only> NTT and other non-IBM modems can be attached via the CCITT feature.<)

Bibliography: GC20-0001

SPECIFY

- (Canada only> Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug.<)
- Power (AC, 1-phase): One must be specified. Note: Not recommended for field installation.

50 Hz		60 Hz	
100V	#2804	100V	#2730
110V	#2805	115V	#9901
123.5V	#2811	200V	#2732
200V	#2806	220V	#2803
220V	#2813		
235V	#2814		

- Power Cords: One must be specified. Note: Not recommended for field installation.

59 Hz cord without plug (#2760)
60 Hz cord without plug (#2762)

- Color Group: One only must be specified. Available at time of manufacture only. #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray.
- Language Group: One must be specified. Note: Not recommended for field installation.

English	#2927
Italian	#2932
French	#2928
German	#2929
Japanese	#2930
Spanish	#2931

- Keyboard Arrangement: One must be specified. Note: Not recommended for field installation except for International (#2950) which may be field installed. International (#2950) is required if #2766 - 48-character set EBCDIC (HN Character Set) is specified at time of manufacture. International (#2950) may not be field removed. Also see Print Belt, Add'l, in "Accessories".

Brazilian	#2975	Japanese	#2955
English UK	#2958	Japan Katakana	#2973
Finnish	#2963	Portuguese	#2959
French	#2970	Spanish	#2960
German	#2957	Span Speak	#2969
Int'l	#2950		
Italian	#2968		

- Print Belt Character Set: Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine. See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry.

(Canada only> #9489 -- 48-character set EBCDIC (HN Character Set)*
#9490 48-character set EBCDIC (Standard Character Set)*

#9491 64-character EBCDIC
#9492 94-character set EBCDIC
#9493 48-character set ASCII**
#9494 64-character set ASCII**
#9495 94-character set ASCII**<)

(Except Canada>#2766 -- 48-character set EBCDIC (HN Character Set)* **
#2767 48-character set EBCDIC (Standard Character Set)*
#2768 64-character set EBCDIC<)

#2873 127-character set, Japan Katakana****

* These belts are identical except for the special character differences:

HN Character Set has:) (=
Standard Character Set has: % # @

(Canada only>** ASCII Feature (#1201) is required.<)

(Except Canada>*** International Keyboard Arrangement (#2950) required.<)

**** #2873 requires #2973. The Japan 48- or 64-character Print Belts (see "Accessories") can be used interchangeably with the 127-character Katakana print belt when #2873 is specified.

Print Belts are interchangeable by the operator. The internal code structure adapts to the belt installed as follows:

HN Character Set Specified	Data Stream Char	Printed Char
HN Belt Installed) (=) (=
HN Belt Installed	% # @) (=
Std Belt Installed) (=	% # @
Std Belt Installed	% # @	% # @
Std Character Set Specified		
Std Belt Installed	% # @	% # @
Std Belt Installed) (=	- - -
HN Belt Installed	% # @) (=
HN Belt Installed) (=	- - -

- Cabling: Fixed-length cables are supplied as standard. Refer to "Installation Manual - Physical Planning", GA27-3006.
- Remote Power Off (#9501): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.

MODEL CONVERSIONS

Changes from model 1 to model 2, 3 or 4 and from model 2 to model 4 are field installable. Note: Customer price quotations and customer order acknowledgment letters for purchase MESS must state: "Installation of this model change involves removal of parts which become the property of IBM".

SPECIAL FEATURES

(Except Canada> All special features can be field installed.<)

(Canada only> All special features can be field installed, except #1201 for which field installation is not recommended.<)

For Communication Capability: Select one Communication Feature (#1460, #1461 or #1470); a Communication Driver (#1481); one Integrated Modem (Canada only> (#5600, #5602, #5610, #5700, #5702, #5710) or EIA<) (#2881, #5600, #5602, #5700, #5702) or CCITT Interface (#3701). X.21 Adapter for Nonswitched Networks (#5655). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

(Canada only> ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette) and with BSC features #1460, #1461 or #1462 or with SDLC features #1460 or #1470. Maximum: One Field Installation: Not recommended. Specify: Orders for #1201 must also specify one print belt, #9493 for 48-character ASCII, #9494 for 64-character ASCII, or #9495 for 94-character ASCII.<)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. Limitations: Cannot be installed with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC, Point To Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. Limitations: Cannot be installed with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. Limitations: See GA27-3097 for BSC compatibility considerations. Maximum: One. Prerequisites: #1460 or #1461.

SDLC (#1470): Provides for switched or nonswitched SDLC procedures. (Canada only> For record purposes, also identify the primary CPU/Program Environment code. Specify one of the following: #9977 for DOS/VS VTAM, #9988 for OS/VS1 VTAM, #9989 for OS/VS2 VTAM, or #9993 for all other combinations of operating systems and access methods.<) Limitations: Cannot be installed with #1460 or #1461. Maximum: One.

Communication Driver Without Business Machine Clocking (#1481): Provides communication driver without clocking. Maximum: One. Prerequisites: #1460, #1461 or #1470. 2400 bps Integrated Modem, Switched, Caducee Network (#2881)

This self-clocked modem provides for point-to-point operation over the Caducee switched network. Operator controls provide for half-speed operation and Talk/Data. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitations: The keys provided for this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with these locks can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One. Prerequisites: Diskette Storage, 2nd (#4902).

(Canada only> EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds up to 4800 bps for switched or nonswitched operation are

permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3902) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. Limitations: Cannot be installed with any Integrated Modem Feature. Maximum: One. Prerequisites: #1481.<)

(Except Canada > CCITT Interface (#3701): Provides a CCITT interface and cable for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO standard 2110 and other relevant CCITT Recommendations, refer to M2700 pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds of up to 4800 bps for switched and nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3902) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. Limitations: Cannot be installed with any Integrated Modem feature.<) Not with X.21 Adapter for Nonswitched Networks (#5655). Maximum: One. Prerequisites: #1481.

(Japan Only > Specify: #2946 for NTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy.<)

Modem Fan-Out (#3901): Equips the 2400 bps Integrated Modem, Nonswitched, Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. Limitations: This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. Maximum: One. Prerequisites: #5602.

Modem Fan-Out (#3902): Equips the 4800 bps Integrated Modem, Nonswitched, Multipoint (#5702) with the capability to be shared by up to two other terminals in addition to the terminal containing the integrated modem. Limitations: This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. Maximum: One. Prerequisites: #5702.

Forms Stand: Integrated into the machine covers for the 3776 mdl 1 and 2.

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. Maximum: One.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left cabinet. Additional diskettes are available from IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 949 256-byte records or up to 474 512-byte records can be stored on the diskette (one 256-byte data record is reserved for forms control information). Each 256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Each 512-byte record is stored in four consecutive sectors in interchange mode, or four non-consecutive sectors in 3770 mode. Diskette data is code insensitive in SDLC mode, non-transparent only in BSC mode. Maximum: One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. *The second diskette allows additional capabilities for: Copy - data can be copied from Diskette 1 to Diskette 2 (single data set or all active data sets - 3770 mode only) - Concatenate (pool) - the ability to concatenate on a data set basis - Continue - allows a read or write operation

to automatically continue to Diskette 2 if it has been placed in a Ready condition. Maximum: One. Prerequisites: #4901. Orders for field installation must specify color - #9081 for red, #9082 for yellow, #9083 for blue, or #9085 for gray. Color must be the same as that specified for the base machine.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8" ranging from 0.007" to 0.045" thick may be read. See "NDD-SS Sales Manual" for magnetically striped and encoded identification cards. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. Limitations: The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. BSC programming for 2770 and 3780 does not support this feature. Maximum: One.

2400 bps Integrated Modem, Nonswitched, Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. For Japan only: Also specify #2943 for NTT D-1 Service Connection.

2400 bps Integrated Modem, Nonswitched, Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<) (Canada only > 2400 bps Integrated Modem Switched, With Auto Answer (#5610)

This self-clocked modem provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Operator controls provide for half-speed operation. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.<)

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT X.21 characteristics for attachment of data communication equipment. Feature operates only over nonswitched lines using SDLC procedures. Speeds of 2400 or 4800 bps are permitted. Limitations: 1) Japan DDC nonswitched Network only. 2) Not with #3701. 3) Not with Integrated Modem features. Maximum: One. Prerequisites: #1470, #1481. Specify: (Record purposes only) #9822 for 2400 bps, #9823 for 4800 bps.

4800 bps Integrated Modem, Nonswitched, Point-To-Point (#5700): This self-clocked modem provides for point-to-point operation over 4-wire nonswitched communication facilities. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<)

4800 bps Integrated Modem, Nonswitched, Multipoint (#5702): This self-clocked modem provides for multipoint operation over 4-wire nonswitched communication facilities. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, #5655 or with another Integrated Modem. Maximum: One. Prerequisites: #1481. (Japan only > Also specify #2943 for NTT D-1 Service Connection.<)

(Canada only > 4800 bps Integrated Modem, Switched, With Auto Answer (#5710): This self-clocked modem provides for point-to-point operation over switched network facility using manual originate/auto answer for establishing connection. This modem features automatic equalization and manual half-speed select. Limitations: Cannot be installed with #3701, or with another Integrated Modem. Maximum: One. Prerequisites: #1481.<) (Canada only > Note: Attachment to the switched telephone network is via

common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

(Canada only > Switched Network Backup (#7951): Provides the capability of attaching 2400 bps Integrated Modem (#5600 or #5602) to the switched network facility as a backup to the primary non-switched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 2400/1200 bps with an IBM 3872 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. Note: To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required at the using system. This feature can be used with BTAM programs for DOS/VS, OS/VS1 and OS/VS2 in certain configurations. Additional customer program routines will be required in existing BTAM programming to fully utilize the capabilities of this feature. Limitations: Cannot be installed with #3701. Maximum: One. Prerequisites: 2400 bps Integrated Modem (#5600 or #5602). <)

(Canada only > Note: Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

(Canada only > Switched Network Backup (#7952): Provides the capability of attaching 4800 bps Integrated Modem (#5700 or 5702) to the switched network facility as a backup to the primary non-switched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 4800/2400 bps with an IBM 3874 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. Note: To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required on the using system. Additional customer program routines will be required in existing programming to fully utilize the capabilities of this feature. Limitations: Cannot be installed with #3701. Maximum: One. Prerequisites: #5700 or #5702. <)

(Canada only > Note: Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user. <)

3501 Card Reader Attachment (#8050): To attach a 3501 Card Reader. Limitations: Cannot be installed with #8149. If a 3521 is also attached (#8150), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

3782/2502 Card Reader Attachment (#8149): To attach a 3782 Card Attachment Unit mdl 2 and a 2502 Card Reader mdl A1 or A2. Limitations: Cannot be installed with #8050. If a 3521 is also attached via #8150, the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check, Card Print or Card Print Katakana. Limitations: If a 2502 or 3501 Card Reader is also attached (#8149 or 8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt: A metal belt with engraved font. Available in EBCDIC character arrangement for the countries listed in the table below. Character set sizes of 64 or 94 (96 positions of which 94 are printable) are available. See "Specify" for restrictions or limitations. The belt can be interchangeably used with the one provided on the machine. Order must contain two feature numbers, one from Table A and one from Table B.

Table A - Character Set Size

#2796	48-character set (HN Character Set)*
#2797	48-character set (Standard Set)
#2798	64-character set
#2799	94-character set
#5831	96-character Courier (WP-EBCDIC)
#5832	96-character Artisan (WP-EBCDIC)
#5833	128 character DP and WP) (EBCDIC)

Table B - Country Arrangement

#2975	Brazil**	#2968	Italy
#2977	Canada(Fr.)**	#2955	Japan(Eng.)**
#2956	English US	#2973	Japan(Kata.)
#2958	English UK	#2960	Spain
#2970	France	#2969	Span. Speak**
#2957	Germany	#2953	Text Print
#2950	Int'l * **		EBCDIC(English US only)

* Country Arrangement International (#2950) must be used with 48-Character set (#2796) (HN Character Set).

** Not available with #5831, #5832 or #5833.

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. Note: Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670, or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3776 COMMUNICATION TERMINAL MODELS 3, 4

PURPOSE

The 3776 is a medium speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776-3 and 3776-4 are SNA Multiple Logical Unit (MLU) terminals. A keyboard and a console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal set-ups and local utility programs in terminal storage for use by the terminal operator. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, 94-, or 127-character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operates at 50 cpm.

MODELS 3, 4

Model 3 003

Maximum LPM	Character Set
300	48
230	64
160	94
80	127 Katakana

Model 4 004

Maximum LPM	Character Set
400	48
300	64
230	94
160	127 Katakana

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard, console display, terminal storage and printer are standard. One communications feature (#3701, #4501, #5605 or #5651) is required. For other configurations, refer to "Special Features" below. The duplex data communications capability of the 3776-3, -4, 3777-3 is operational on nonswitched full-duplex communications facilities only.

Prerequisites for SDLC Communications with S/370 or 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370, 4331 or 4341 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, POWER/VS or VTAM. An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for Duplex data stream operation.

HIGHLIGHTS

- Keyboard: EBCDIC arrangement with (Canada only >44<) (Except Canada >47<) data keys for all countries except Japan (Katakana). Japan Katakana uses 48 data keys. The keyboard, in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display, provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Advance are

non-destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.

- Console Display: Contains 16 lines of 64 characters each for a total of 1024 characters. The 3776-3 and 3776-4 reserve the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input. Lower case alphabets are converted to upper case before displaying. Katakana machines provide for upper case Katakana characters only. When the cursor is beneath a character, any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted. Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time, the operator is prompted to specify date and time. As messages are received, they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the Greater Than sign in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state, a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

- Printer: Line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, 94- or 127-character set) -- see "Specify". Also standard are a variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3844 for forms design considerations.
- Forms Stand: Is integrated into the machine covers for the 3776 mdl 3 and 4.
- Terminal Storage: Is standard for message spooling, terminal control, utility programs and user-generated procedures.
- Diskette Storage: There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3776-1 and 3776-2, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used locally for input or output. Diskette operation is concurrent with other terminal functions.
- Magnetic Tape: May be used as either an input or as an output device. One 3411-1 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411-1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. 7-track tape operation is not provided. The 3411-1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed or variable length and may be unblocked or blocked to a maximum block size of 4000 bytes. Maximum record size is 255 bytes. A block size of up to 2000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal

functions. Refer to G232-0004 for detailed information on operation of the 3411-1. Refer to M3411 for ordering information. Feature #7003 is required on the 3411 mdl 1.

- **Buffers:** Transfer data between the input and output devices and the communication line. SDLC communications uses a customer-defined Request/Response Unit (RU) of 256 or 512 byte buffer. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. Buffers also transfer data between input and output devices during local operation.
- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical control characters in data initiate vertical tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.
- **Compression/Expansion:** Implementation provides a compression option at the terminal for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.
- **Decompression:** Provides the decompression function associated with the receipt of a compacted data stream whereby a pair of consecutive alphameric characters is represented by a single transmission byte. Function depends upon transmission by the host of a decompression table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompression occurs for data directed to the printer, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided.
- **Automatic Card Reading:** Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.
- **Job Control:** Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local utility jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printer, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printer, Diskette, Card Punch
Diskette	Printer, Magnetic Tape, Diskette, Card Punch

- **Record Formats:** Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape data sets, are also applicable to diskette as a function of Basic Exchange data sets (128 byte maximum).

Basic Exchange diskettes may be read by the terminal. Basic Exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 120 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

- **Remote Power Off:** See #9501 under "Specify" below.
- **Encrypt/Decrypt Feature:** Available to provide secure data transmission in conjunction with ACF VTAM Encrypt/Decrypt Feature (Program Number 5735-RC2) (Feature Number 6010) and Programmed Cryptographic Facility Program Product (Program Number 5740-XY5).

Performance Considerations: The line-to-printer performance of the 3776-3 is up to 300 lpm with a 48-character set print belt. The line-to-printer performance of the 3776-4 is up to 400 lpm with a 48-character set print belt.

The 3776-3 and 3776-4 MLU terminals will operate, however, with concurrent input-output processing in either a Duplex or Half Duplex data communications mode as a function of the base Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations. The degree of degradation which may occur will tend to be greater when Half Duplex communications are employed as opposed to Duplex communications and system facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, SNA pacing, cryptographic processing, etc., must all be considered in determining actual throughput.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half Duplex communications mode. The 3776-3 or 3776-4 operating Duplex at (Canada only > 19.2K bps <) (Except Canada > 20.4K bps <) on a terrestrial link may, however, present a variance of from greater to degrade overall terminal throughput when compared to comparable operation in a half-duplex mode.

Problem Determination Procedures: Function has been designed into this unit to help provide availability to the customer. See "IBM 3770 Multiple Logical Unit Operator's Guide for 3776-3, 3776-4, 3777-3", GA27-3125.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features" -- Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps. Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above (Canada only > 4800 <) (Except Canada > 9600 <) bps are on nonswitched facilities. Direct local attachment to 3705-II at 1.4K bps or a 3725 at 19.2K bps. EBCDIC is the standard transmission code. (Canada only > ASCII is available as a special feature. <) Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

Modem	Speed (bps)	Lines

SPECIFY

- (Canada only) Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug. See M3411 for Magnetic Tape Unit voltage requirements. <
- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V (#2730)
110V #2805	115V (#9901)
123.5V #2811	200V (#2732)
200V #2806	220V (#2803)
220V #2813	
235V #2814	

See M3411 for Magnetic Tape Unit power requirements.

- Power Cords: One must be specified.
50 Hz cord without plug (#2760)
60 Hz cord without plug (#2762)
- Color Group: Blue is supplied as standard except for field model conversions where installed color groups will be matched (do not specify).
- Language Group: One must be specified. Note: Not recommended for field installation.
English #2927 Italian #2932
French #2928 Japanese #2930
German #2929 Spanish #2931
- Keyboard Arrangement: One must be specified. Note: Not recommended for field installation except for International (#2950) which may be field installed. International (#2950) is required if #2766 - 48-character set EBCDIC (HN Character Set) is specified at time of manufacture. International (#2950) may not be field removed. Also see "Print Belt, Add'l" in "Accessories".
Brazilian #2975 Japanese #2955
English UK #2958 Japanese #2958
French #2970 Katakana #2973
German #2957 Portuguese #2959
Int'l #2950 Spanish #2960
Italian #2968 Span Speak #2969
- Print Belt Character Set: Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine). See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry.

HN Belt Installed	% # @) (=	
HN Belt Installed) (=	- - -	

- Cabling: Fixed-length cables except for 3411 Magnetic Tape and Control are supplied as standard. Refer to "Installation Manual - Physical Planning", GA27-3006. 3411 cables must be separately ordered.
- Remote Power Off (#9501): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.
- (Canada only>EIA RS-232C 19.2K bps Line Speed: #9481 -- provides support of 19.2K bps. <)
- (Canada only>Alternate Address (#9011): (For record purposes only) Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by<) (Canada only>CE<) (Canada only>using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location.<)

SPECIAL FEATURES

All special features can be field installed. (Canada only>Field installation is not recommended for feature #1201.<)

(Canada only>ASCII Feature (#1201): A 48-data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). Maximum: One. Field Installation: Not recommended. Specify: Orders for #1201 must also specify one print belt, #9493 for 48-character ASCII, #9494 for 64-character ASCII, or #9495 for 94-character ASCII.<)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One.

CCITT-V35 Interface (#2911): Provides a cable and interface compatible with CCITT-V35 recommendations for attachment of data communication equipment (see M2700 pages). Speed of (Canada only> 19.2K bps<) (Except Canada>20.4K bps<) is permitted.

(Canada only>See the IBM Canada Data Communications Handbook for information.<) Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with a maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150.0m (491 ft). Limitations: Cannot be installed with #3701, #4501 or #5655. Maximum: One.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitations: The keys provided for this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with these locks can be duplicated by local key makers. Additional or replacement keys are not available from IBM. Maximum: One. Prerequisites: #4902.

Encrypt/Decrypt (#3680): Provides cryptographic data transmission in conjunction with program support in the host. Includes a security keylock. Each machine will have its own unique key. Two identical keys are supplied with the feature. Maximum: One. Prerequisites: A mercury battery, IBM P/N 1743456 or equivalent is required. A battery is shipped with this feature. See "Accessories" for additional or replacement battery. Replacement of the discharged battery is the customer's responsibility.

(Canada only>EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. Limitations: Cannot be installed with DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multipoint (#5651), High-Speed Digital Interface (#4501), or V35 Interface (#4720). Maximum: One. Prerequisites: For 19.2K bps operation, #9481 is required -- see "Specify".<)

(Except Canada>CCITT-V24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 Pages). Other external non-IBM modems may be attached subject to the Multiple System Supplier Bulletin. Speeds from 2400 bps to 9600 bps are permitted.

Limitations: Cannot be installed with<) (Except Canada>#4501 or #2911.<) #4501, #2911 or #5655. (Except Canada>Maximum: One.<) (Japan only>Specify: #2946 for NTTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy.<)

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

High-Speed Digital Interface (#4501): Provides a cable and interface for attachment to a modem which permits point-to-point and multipoint synchronous operation at (Canada only>19.2K<) (Except Canada>20.4K<) bps on a broadband channel. Limitations: Cannot be installed with #3701, #2911, or #5655. Maximum: One.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to keyboard control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. Maximum: One.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left desk cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange data set or in a 3770 format data set. Diskette capabilities allow for: Concatenate (pool) - the ability to concatenate on a data set basis -- Multivolume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive. Maximum: One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Copy - data can be copied from Diskette 1 to Diskette 2. Maximum: One. Prerequisites: #4901.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus

odd parity. Card size 3-3/8" x 2-1/8" ranging from 0.007" to 0.045" thick may be read. Data read from the magnetic stripe card cannot be printed or displayed. Limitations: The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. Maximum: One.

X.21 Adapter For Nonswitched Networks (#5655): Provides a cable and interface meeting CCITT X.21 characteristics for attachment of data communication equipment. Feature operates only over non-switched lines using SDLC procedures. Speeds of 2400, 4800 or 9600 bps are permitted. Limitations: 1) Japan DDC nonswitched Network only, 2) Not with #3701, #2911 or #4501. Maximum: One. Specify: (Record purposes only) #9822 for 2400 bps, #9823 for 4800 bps, or #9825 for 9600 bps.

3411 Magnetic Tape Unit And Control Mdl 1 Attachment (#7801): To attach one 3411 Magnetic Tape Unit and Control mdl 1. Maximum: One. Prerequisites: #7003 on the 3411-1.

3782/2502 Card Reader Attachment (#8149): To attach a 3782 Card Attachment Unit Mdl 2 and a 2502 Card Reader Mdl A1, A2, or A3. Limitations: OMR is not supported. Maximum: One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. Limitations: The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One.

MODEL CONVERSIONS

Changes from model 3 to model 4 are field installable.

Note: Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM."

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt: A metal belt with engraved font. Available in EBCDIC character arrangement for the countries listed in the table below. Character set sizes of 64 or 94 (96 positions of which 94 are printable) are available. See "Specify" for restrictions or limitations.

The belt can be interchangeably used with the one provided on the machine.

Order must contain two feature numbers, one from Table A and one from Table B.

Table A - Character Set Size

#2796 48-character set (HN Character Set)*
#2797 48-character set (Standard Set)
#2798 64-character set
#2799 94-character set
#5831 96-character Courier (WP-EBCDIC)
#5832 96-character Artisan (WP-EBCDIC)
#5833 128-character DP and WP (EBCDIC)

Table B - Country Arrangement

#2975 Brazil**	#2968 Italy
#2977 Canada Fr.**	#2955 Japan Eng.**
#2956 English US	#2973 Japan Katakana
#2958 English UK	#2960 Spain
#2970 France	#2969 Span Speak**
#2957 Germany	#2953 Text Print -
#2950 Int'l* **	EBCDIC-English
	US only

* Country Arrangement International (#2950) must be used with 48-Character set (#2796) (HN Character Set).

** Not available with #5831, #5832 or #5833.

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. Note: Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670, or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3777 COMMUNICATION TERMINAL MODEL 1

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 3777 mdl 1 is a high-speed remote job entry terminal and is a member of the 3770 Data Communication System. A keyboard is used for terminal control and may be used for operator communication with the host CPU. A printer is used for output. The 3777 mdl 1 is not designed as an interactive terminal. The printer is not integrated into the 3777 mdl 1 but is a stand-alone IBM 3203 mdl 3 printer which is cable-attached to the 3777 mdl 1. The 3203 mdl 3 uses the IBM 1416 Interchangeable Train Cartridge which can be interchanged by the operator. Special features permit one or two diskette storage devices, and provide for the attachment of one card reader. One of three card readers can be selected for operation at 150, 300 or 400 cards per minute. A minimum configuration includes a 3777 mdl 1 Communication Terminal and a 3203 Printer mdl 3.

Communication features permit operation at speeds of up to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps using BSC or SDLC transmission techniques and an appropriate modem. Direct Local Attachment to 3705-II at 14.4K bps or to a 3725 at 19.2K bps via appropriate features.

Maximum Lines Per Minute

Standard 3203-3	Featured 3203-3	Character Set
1000	1200	48 AN, HN
870	1020	60 PN
717	815	107 Katakana
530	585	127 Katakana

See Type Catalog for additional character sets and speeds.

See M3203 pages for 1200 lpm Speed Enhancement feature information.

MODEL 1

Model 1 001

Limitations: The input/output capabilities are dependent upon appropriate configurations of the terminal. Keyboard is standard on the 3777 mdl 1, while the 3203 Printer mdl 3 is a stand-alone unit. A minimum configuration includes a 3777 mdl 1 Communication Terminal and a 3203 Printer mdl 3.

Prerequisites: For SDLC Communications With S/370, 30XX or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 or 4300 Processor operating under VTAM or TCAM through VTAM with OS/VS1 or OS/VS2, VTAM with DOS/VS, or these operating systems running under VM/370.

For BSC Communications With S/360, S/370, 30XX or 4300 Processors: A virtual storage S/370 or 4300 Processor operating under BTAM or VTAM and DOS/VS, or under BTAM, TCAM or VTAM and OS/VS1 or OS/VS2; or under RSCS and VM/370; or any of these operating systems running under VM/370. The 3777 mdl 1 Communication Terminals use 2770/3780 BSC programming support when operating in BSC mode. Operation with S/360 or 4300 processor using 2770/3780 BSC programming is also permitted. See GA27-3097 for BSC compatibility considerations. The customer may have to modify existing 2770/3780 application programs for operation with 3777 mdl 1. BSC attachment can be via a 3704, 3705, or 3725 Communications Controller, or a 2701 Data Adapter Unit attached to a channel of any S/370 processor; or via an Integrated Communications Adapter on S/370 mdls 115, 125, 135, 135-3 or 138; or via a Communications Adaptor feature on the 4331 or 4361 Processor. BSC attachment can be made via a 3704/3705 attached to a channel

of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75 or 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in 65 mode), 75 or 195; or via an Integrated Communications Attachment on S/360 mdl 25.

For BSC Communications With System/38: All mdls of S/38 running under CPF (5714-SS1) featured with Communications Attachment (#1501 or #1502) and Communications Control, SDLC/BSC (#2001 or #2003). See "IBM System/38 Data Communications Programmer's Guide", SC21-7825, for BSC function and compatibility consideration.

HIGHLIGHTS

- **Keyboard:** (Canada only > EBCDIC arrangement with 44 data keys (produces 88 characters). Underscore/Hyphen, Backspace, Space and Character Advance keys have typamatic action.) (Except Canada > All countries except Japan (Katakana) use EBCDIC arrangement with 47 data keys (producing 94 characters). Underscore/Hyphen, Backspace, Space, and Character Advance keys have typamatic operation. Japan Katakana uses 48 data keys in EBCDIC arrangement (producing 127 characters). Typamatic operation is provided for Backspace, Space, Tab, New Line and Character Advance.) Associated with the keyboard are indicator lights, function keys, operating mode switches, and a 3-position numeric display.
- **Printer:** A stand-alone 3203 mdl 3 Printer cable-attached to the 3777. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 1 supports fifteen Print Train Arrangements (AN, HN, OAA, ONA, ODA, OAB, GN, PCS-AN, PCS-HN, PN, QN, QNC, RN, SN, TN) as standard. When a substitute character is ordered to displace a character in one of the standard arrangements, the substitute character assumes the card and bit codes of the character it replaces. Refer to the Type Catalog. If the International Print Support specify feature #9351 is installed, the 3777 mdl 1 will support Print Train Arrangements corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN and PCS-HN, 107- and 127- character Japanese Katakana Print Train (see Type Catalog) arrangements. The 3203 mdl 3 accepts continuous forms of up to 20 inches wide and 132 print positions. Character spacing is 10 per inch; line spacing is 6 or 8 per inch under operator control. Maximum print lines are 127 per page when attached to the 3777 mdl 1. Refer to M3203 pages for further description of the 3203 mdl 3 Printer. Refer to Type Catalog for further description of the 1416 print train arrangements supported and for print speeds. Refer to GA24-3488 for forms design considerations.
- **Buffers:** Transfer data between the input and output devices and the communication line. The buffers also transfer data between input and output devices during offline operation. Buffers alternate in providing input and output services to permit overlapped operation. Dual 256-byte or 512-byte buffers are used for BSC or SDLC operation and are under operator control.
- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing.
- **Compression/Expansion:** Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from card and diskette. A two-byte sequence is substituted for each occurrence of three or more consecutive blank bytes (63 consecutive blanks is the upper limit). A second two-byte sequence is appended if more than 63 consecutive blank bytes are read. Incoming non-transparent data (destined for the printer) is monitored

by the terminal which automatically expands this two-byte sequence to the correct number of blanks.

SDLC implementation provides a compression option at the terminal for a job that reads data from cards or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.

- **Decompression:** Provides the decompression function associated with the receipt of a compacted data stream whereby a pair of consecutive alphanumeric characters is represented by a single transmission byte. Function is dependent upon transmission receipt, and subsequent 3777 mdl 1 storage, of a decompression table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompression function is available only under SDLC operation. Decompression occurs only for data directed to the printer. Compaction by the 3777 mdl 1 of data inbound to the host is not provided.
- **Transmission Reversal:** Data transmission from the host may be temporarily interrupted, via the keyboard, to permit data transmission from the terminal. When the terminal has completed its data transmission, the host automatically resumes its own transmission of data. This function is dependent upon associated host programming.
- **Record Compress:** Using two special feature diskette storage devices permits offline compression of Basic Exchange diskette records onto a single 3777 mdl 1 diskette for subsequent batch transmission. The compressed records are written on the 3777 diskette in 3770 mode. Record Compress, using one diskette storage device, permits the compression of basic exchange diskette records into blocks of up to 256 or 512 bytes for transmission.
- **Dual Data Path:** Provides for concurrent operation of a line-to-print primary job and a card reader-to-diskette or diskette-to-diskette secondary job. The line-to-printer job uses either the dual 256-byte or dual 512-byte alternating buffers to accept data from the line for printing. A single 256-byte or single 512-byte buffer is used for data buffering between card-and-diskette or diskette-and-diskette. The primary line-to-printer job will not normally be degraded during Dual Data Path operation. The secondary job will be degraded during periods of concurrent operation.
- **Automatic Card-to-Line Job:** When an online job is completed and the 3777 goes into Standby Status, a reader-to-line job is automatically started. The Start-Job procedure is not required provided the terminal has a 2502 Card Reader and it is in Ready Status.
- **Remote Power Off:** This feature can be used to conserve energy. The host CPU application program can initiate "power down" at the terminal by sending a controlled data sequence over communication special facilities. The terminal must also be equipped with the appropriate special communication features. This capability is in addition to the standard, manually operable "power down" switch.
- **Input/Output Form Definitions:** Can be operator or terminal defined. Up to five operator defined forms settings can be read from diskette or card reader to facilitate rapid job set-up when the terminal is equipped with either of the special features, otherwise they can be entered from keyboard. Printer format controls can be part of the job definition. An appropriately configured 3777 mdl 1 will permit input/output job designation as follows:

	Input	Output
Offline Jobs	Diskette(1)	Printer or Diskette
	Card Reader(1)	Printer or Diskette

Online Batch Jobs	Diskette or Card Reader(1) Line(1)	Line Printer or Diskette
-------------------	------------------------------------	--------------------------

Dual Data Path Jobs	Line(2) Card Reader(2) Diskette(2)	Printer Diskette Diskette
---------------------	------------------------------------	---------------------------

1. One input device and one output device per job.
2. Line-to-printer occurs concurrently with card reader-to-diskette or diskette-to-diskette.

Performance Considerations Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See "IBM 3770 Data Communication System", GA27-3097, for additional information.

Problem Determination Procedures: These are easily understood problem identification routines and procedures for use by the operator. See "IBM 3777-1 Operating Procedures Guide", GA27-3124.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features". Transmission speeds of up to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps are allowed by selecting the appropriate modem and communication facility. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. Refer to S3770 pages for a Communication Configurator. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

(Canada only > For 19.2K bps the 3777 mdl 1 may use either the EIA or the High-Speed Digital Interface to communicate through an appropriate modem and communication facility with a 3704/3705 Communication Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection) and which provide optional EIA or RS-232-C or High-Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature on the 4331 Processor. See M4331 pages for details. <)

IBM Modems	Speed (bps)
3863	2400
3868 mdl 1	2400
3864	4800
3868 mdl 2	4800
3865	9600
3868 mdl 3,4	9600

Note: 4-wire Switched Network Backup is available on 3863, 3864 and 3865. For communications capability, product utilization and features, see M3863, 3864 and 3865 pages.

Publications: GC20-0001

SPECIFY

- (Canada only > Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug. See 3203 mdl 3 for 3-phase power requirements. <)

- Power (AC, 1-phase): One must be specified.

50 Hz		60 Hz	
100V	#2804	100V	#2730
110V	#2805	115V	#9901

123.5V	#2811	200	#2732
200V	#2806	220V	#2803
220V	#2813		
235V	#2814		

See M3203-3 pages for 3-phase power requirements.

- Power Cords: One must be specified.

50 Hz cord without plug - #2760
60 Hz cord without plug - #2762

- Color Group: Blue is supplied as standard.
- Language Group: One must be specified.

English	#2927	Japanese	#2930
French	#2928	Italian	#2932
German	#2929	Spanish	#2931

Note: Not recommended for field installation.

- Keyboard Arrangement: One must be specified.

Brazilian	#2975	Italian	#2968
English UK	#2958	Japanese	#2955
French	#2970	Japan Katakana	#2973
German	#2957	Spanish	#2960
Int'l	#2950	Spanish Speak	#2969

Note: Not recommended for field installation.

- International Print Support (#9351): Provides support for modified AN, PN and SN Print Train Arrangements for the 1416 Interchangeable Train Cartridge corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PCS-HN, 107- and 127-character Katakana Print Train Arrangements. See "Type Catalog". **Note:** Not recommended for field installation. Replaces standard print support.
- Cabling: Fixed-length cables are supplied as standard. Refer to "Installation Manual-Physical Planning". (Except Canada > GA27-3006 <) (Canada only > and to "Customer Site Preparation Planning Guide", GA27-3103. <)
- (Canada only > EIA RS-232-C 19.2K bps Line Speed: #9481 --- provides support of 19.2K bps. Provides diagnostics <)

SPECIAL FEATURES

Communication Features

For Communication Capability, select one of the following Communication features (#1460, #1461 or #1470); a Communication Driver (#1481); and (Canada only > EIA Interface (#3701) or High-Speed Digital Interface (#4501) <) CCITT-V24/28 Interface (#3701), CCITT-V35 Interface (#2911), or High-Speed Digital Interface (#4501) or X.21 Adapter for Nonswitched Networks (#5655). BSC Multipoint (#1462) is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. Limitations: Cannot be installed with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One. Field Installation: Yes.

Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. Limitations: Cannot be installed with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. Maximum: One. Field Installation: Yes.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. Limitations: See GA27-3097 for BSC com-

patibility considerations. Maximum: One. Field Installation: Yes. Prerequisites: #1460 or #1461.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. Specify one of the following: #9977 for DOS/VS VTAM, #9988 for OS/VS1 VTAM, #9989 for OS/VS2 VTAM, or #9993 for all other combinations of operating systems and access methods. Limitations: Cannot be installed with #1460 or #1461. Maximum: One. Field Installation: Yes.

Communication Driver Without Business Machine Clocking (#1481): Provides communication driver without clocking. Maximum: One. Field Installation: Yes. Prerequisites: Communication Feature (#1460, #1461 or #1470).

CCITT-V35 Interface (#2911): Provides a cable and interface compatible with CCITT-V35 recommendations for attachment of Data Communication Equipment (see M2700 pages). Speed of 20.4K bps is permitted. Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet. Field Installation: Yes. Prerequisites: #1481. Limitations: Cannot be installed with #3701, #4501, or #5655.

(Canada only > EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. Limitations: Cannot be installed with #4501 <) (Canada only > Maximum: One. Prerequisites: For 19.2K bps operation, #9481 is required. See item under "Specify". <)

(Except Canada > CCITT-V24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 pages). Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds from 2400 bps to 9600 bps are permitted. Limitations: Cannot be installed with #4501 or #2911. <) or #5655.

(Except Canada > Maximum: One. Field Installation: Yes. Prerequisites: #1481. <) (Japan only > Specify: #2946 for NTTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy. <)

High-Speed Digital Interface (#4501): Provides an interface and a cable for attachment to a modem which permits point-to-point synchronous operation at (Canada only > 19.2K bps on a Type 5703 or 8803 wideband <) (Except Canada > 20.4K bps on a broadband <) channel. Limitations: Cannot be installed with #3701 or #2911 or #5655. Maximum: One. Field Installation: Yes. Prerequisites: #1481.

X.21 Adapter For Nonswitched Networks (#5655): Provides cables and interface meeting CCITT-X.21 characteristics for attachment of data communication equipment. Feature operates only over non-switched lines using SDLC procedures. Speeds of 2400, 4800 or 9600 bps are permitted. Limitations: 1) Japan DDC Nonswitched Network only. 2) Not with #3701, #2911 or #4501. Maximum: One. Prerequisites: #1481 and #1470. Specify: #9822 for 2400 bps, #9823 for 4800 bps, or #9825 for 9600 bps.

Non-Communication Features

(Canada only > ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette) and with BSC features #1460, #1461 or #1462 or with SDLC features #1460 or #1470. A #1416 interchangeable Train Cartridge containing an ASCII GN print train is required for the 3203 Printer mdl 3 if 1201 is ordered for the 3777. Maximum: One. Field Installation: Not recommended. <)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One. Field Installation: Yes.

MACHINES

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitations: The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes. Prerequisites: #4902.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output or control of data at the terminal. Each machine will have its own unique key. Two identical key are supplied with the feature. See "Accessories" for information on additional or replacement keys. Maximum: One. Field Installation: Yes.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Characteristics of the diskette storage device are: One movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 949 256-byte records, or 474 512-byte records can be stored on the diskette (one 256-byte data record is reserved for forms control information). Each 256-byte record is stored in two consecutive numbered sectors in exchange mode, or in two non-consecutive sectors in 3770 mode. Each 512-byte record is stored in four consecutive numbered sectors in exchange mode, or four non-consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode. Maximum: One. Field Installation: Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Copy - Data can be copied from diskette 1 to diskette 2 (single data set or all active data sets - 3770 mode only). Concatenate (Pool) - The ability to concatenate on a data set basis. Continue - Allows a read or write operation to automatically continue onto diskette 2 if it has been placed in "ready" condition. Maximum: One. Field Installation: Yes. Prerequisites: #4901.

Operator Identification Reader (#5450): Reads 40 characters (of which 37 are discretionary) from magnetic-stripe cards which are encoded in the ABA format. Each character contains four bits plus odd parity. Card size is 3-3/8 inches by 2-1/8 inches, and cards ranging in thicknesses of from 0.007 inches to 0.045 inches thick may be read. Contact IBM for magnetically striped and encoded identification cards. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic-stripe card cannot be printed. Limitations: (1) The operator must position and slide the card through the reader-slot at a steady rate of between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 and 3780 does not support this feature. Maximum: One. Field Installation: Yes.

Print Speed Enhancement (#5595): Provides support for 3203 Printer mdl 3 operating with 1200 lpm Speed Enhancement feature (#6360). Maximum: One. Field Installation: Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader mdl A1, A2 or A3. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

The following model upgrades are field installable: Mdl 1 to mdl 2 and mdl 2 to mdl 3. Note: Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM".

ACCESSORIES

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

SUPPLIES

Ribbons: For 3203 mdl 3 ribbons, contact IBM.

3777 COMMUNICATION TERMINAL MODEL 2

PURPOSE

The 3777 mdl 2 is a high speed remote job entry terminal which operates as a S/360-20 Submodel 5 BSC MULTI-LEAVING Workstation. A keyboard is used for terminal control and may be used for operator communication with the host CPU. A 3203 mdl 3 Printer is used for output. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge which can be interchanged by the operator. Special features provide for the attachment of one 1024-character console display, one diskette storage device for logging of card image messages, one diskette Storage Device for reading of card image Basic Exchange datasets (processed as 80-column card images), one card reader and one card punch. One of three 2502 Card Reader models can be selected for operation at 150, 300 or 400 cards per minute. The 3521 card punch operates at 50 cpm. A minimum configuration includes a 3777 mdl 2 Communication Terminal, a 3203 Printer mdl 3 and a 2502 Card Reader or a Diskette Input Device (#3201). If a Diskette Input Device is attached and a 2502 Card Reader is not present, a Console Display (#1601) is required. A console display is also required if the keyboard is to be used for operator console communication with the host processor.

Communications features permit operation at speeds of up to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) using BSC transmission techniques and an appropriate modem. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps via appropriate features.

MODEL 2

Maximum Lines Per Minute

Standard	Featured	Character Set
3203-3	3203-3	
1000	1200	48 AN, PN
870	1020	60 PN
717	815	107 Katakana
530	585	127 Katakana

See Type Catalog for additional character sets and speeds.

See M3203 pages for 1200 lpm Speed Enhancement feature information.

Limitations: The input/output capabilities outlined under "High-lights" are dependent on appropriate configurations of the terminal. Keyboard is standard on the 3777 mdl 2 while the 3203 Printer is a stand-alone unit. A minimum configuration includes a 3777 Communication Terminal mdl 2, a 3203 Printer mdl 3 and a 2502 Card Reader or a Diskette Input Device (#3201). If a Diskette Input Device is attached and a 2502 Card Reader is not present, a Console Display (#1601) is required.

Prerequisites: For BSC Communications with S/360 or 4300 Processor: The 3777 mdl 2 will interface to current host MULTI-LEAVING programming systems as a S/360-20 Submodel 5. BSC attachment can be made via a 3704/3705 Communications Controller, a 2701 Data Adapter Unit or a 2703 Transmission Control attached to a channel of any S/360, or S/370, supporting BSC MULTI-LEAVING Workstations. Also attaches via a Communications Adapter feature on the 4331 Processor.

HIGHLIGHTS

- Keyboard: (Canada only > EBCDIC arrangement with 44 data keys (produces 88 characters). Space and Character Advance keys have typamatic action. <) All countries except Japan Katakana use EBCDIC arrangement with 47 data keys (producing 94 characters). Space and Character Advance keys have typamatic operation. Japan Katakana uses 48 data keys in EBCDIC arrangement (producing 127 characters). As-

sociated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display. The keyboard, in conjunction with the optional console display, provides a console function for the 3777 mdl 2.

- Printer: A stand-alone 3203 Printer mdl 3 cable attached to the 3777 mdl 2. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 2 supports 15 Print Train Arrangements (AN, HN, OAA, ODA, ONA, OAB, GN, PCS-AN, PCS-HN, PN, QNC, QN, RN, SN, TN) as standard.

If the International Print Support specify feature is installed, the 3777 mdl 2 will support Print Train Arrangements corresponding to the 48-, 64- and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PSC-HN, 107- and 127- character Japan Katakana Print Train (see Type Catalog) arrangements. The 3203 Printer mdl 3 permits feeding continuous forms up to 20 inches wide and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch under operator control. Maximum form length is 24 inches when attached to the 3777 mdl 2. Refer to the 3203 write up for further description of the 3203 mdl 3. Refer to Type Catalog for further description of the 1416 print train arrangements supported and for print speeds. Refer to GA24-3488 for forms design considerations.

- Console Display: Contains up to 1024 characters of information formatted into 16 lines of 64 character positions each. Operator messages are displayed in the top 14 lines of the display. Operator originated keyboard data is displayed in the bottom two lines of the display and will be displayed as keyed. Katakana machines provide for upper case Katakana characters only on the console display.

Operator messages larger than 64 characters overflow to subsequent lines. Subsequent lines of the message are indented. The latest message displayed is identified with a special character. If the display becomes full, the oldest message is overlayed retaining the most recent messages on the display. The operator may defer subsequent messages in order to complete reference to a particular message.

- Console Display Spooling: A diskette storage device may be attached to the 3777 mdl 2 by special feature to provide storage for operator console messages. Two options are available to the operator when the diskette becomes filled. First, automatic rewrite occurs. New messages are overlaid upon older messages commencing with the initial message written upon the diskette. Second, an end of diskette signal is provided to the operator and messages are suspended pending replacement of the used diskette by a new diskette. The diskette may also be used to IPL the 3777 in lieu of the 2502 once the workstation program has been written on the diskette from a card reader.

Operator access to the diskette is via the keyboard. The diskette may be paged backward a defined number of messages and displayed for reference. In addition, the diskette may be written to the printer.

- Diskette Input Device: A diskette storage device may be attached to the 3777 mdl 2 by special feature for reading of card image Basic Exchange datasets. Basic Exchange datasets will be processed by the 3777 mdl 2 as 80-column card images. The datasets may be multivolume. Individual datasets or all active datasets may be read. Volume label and dataset labels may be printed. Initial Program Load of the workstation program may take place from the Diskette Input Device if the Console Spool Device is not present. Diskette IPL must take place from the Console Spool Device if both diskette devices are present. IPL is available from the 2502 Card Reader if that device is attached.

If the 3777 mdl 2 configuration includes both a 2502 Card Reader and the Diskette Input Device, diskette input may be alternated with cards; however, both devices will not operate

simultaneously. If the 3777 mdl 2 configuration includes a Diskette Input Device instead of a 2502 Card Reader, and IPL is executed from the Diskette Input Device or the Console Spool Device, the IPL diskette containing the workstation program must have been written on a 3777 mdl 2 configuration containing a 2502 Card Reader and a diskette device.

- **Buffers:** Transfer data between the input and output devices and the communication line. The buffers alternate in providing input and output services to permit overlapped operation. Storage is provided in the 3777 mdl 2 for dual buffers for each input and output device attached. The buffer size is variable, dependent upon the workstation program. The recommended buffer size is 512-bytes.

- **Communications Adapter:** Integrated to provide and BSC point-to-point operation over switched or nonswitched facilities.

- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical forms definition provides forms set-up for the printer by means of the keyboard or card reader. The definition may be displayed on the console display, if present, or printed for verification.

Extended forms definition may be used in conjunction with the Diskette Input Device (#3201). Standard forms definition provide for the definition of five printer forms. Extended forms definition provides for greater than five printer forms. The Diskette Input Device (#3201) is a prerequisite to the use of extended forms definition.

- **Compression/Expansion:** Provides a means for improving the efficiency of data transmission. Provides options of (dependent upon the workstation program) trailing blank truncation, blank or data compression/expansion.

- **Performance Considerations:** The line-to-printer performance of the 3777 mdl 2 and attached 3203 Printer mdl 3 is up to 1,000 lpm (up to 1200 lpm with 3203 mdl 3 Speed Enhancement feature) with 48-character AN or HN set and up to 870 lpm (up to 1020 lpm with 3203 mdl 3 Speed Enhancement feature) with a 60 character PN set. The 3777 mdl 2 may operate, however, with concurrent input/output processing as a function of the MULTI-LEAVING capability. The card reader, punch and display console may have a degrading effect on printer performance while transferring data to and from the 3777 mdl 2 buffers and the host as communications line time is shared by all 3777 mdl 2 I/O units.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See "3770 Data Communication System", GA27-3097, for additional information.

- **Problem Determination Procedures:** Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See "IBM 3777-2 Operating Procedures Guide", GA27-3129.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features". Transmission speeds of up to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps. Point-to-point transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 4800 bps are on nonswitched facilities. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. EBCDIC is the only supported transmission code. Refer to M2700 pages for information on

customer responsibilities, communication facilities, and other attachment information.

(Canada only > For 19.2K bps the 3777 mdl 2 may use either the EIA or the High Speed Digital Interface to communicate through an appropriate modem and communication facility with a 3704/3705 Communications Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection) and which provide optional EIA or RS-232-C or High Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature on the 4331 Processor see M4331 pages for details. <)

Modem	Speed (bps)	Lines
3833 mdl 1	2400	Nonswitched voice grade
3834 mdl 1	4800	Nonswitched voice grade
3863 mdl 1/2	2400/1200	Nonsw or Sw voice grade
3864 mdl 1/2	4800/2400	Nonsw or Sw voice grade
3865 mdl 1/2	9600/4800	Nonswitched voice grade
3868 mdl 1	2400/1200	Nonswitched voice grade
3868 mdl 2	4800/2400	Nonswitched voice grade
3868 mdl 3/4	9600/4800	Nonswitched voice grade
5811 mdl 10	2400 to 9600	Limited Distance Modem
5811 mdl 18		Rack mount version of mdl 10
5811 mdl 20	2400 to 9600	Nonswitched baseband
5811 mdl 28		Rack mount version of mdl 20
5812 mdl 10	2400 to 9600	Nonswitched baseband
5812 mdl 18		Rack mount version of mdl 10
5865 mdl 2/3	9600/7200 4800	Nonswitched voice grade
5868 mdl 52		Rack mount version of 5865 mdl 2
5866 mdl 2/3	14400/9600	Nonswitched voice grade
5868 mdl 62		Rack mount version of 5866 mdl 1/2

Note: 4-wire Switched Network Backup is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire Switched Network Backup is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

Publications: GC20-0001

SPECIFY

- (Canada only > Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug. See M3203 mdl 3 pages for 3-phase power requirements. <)
- Power (AC, 1-phase): One must be specified.

50 Hz		60 Hz	
100V	#2804	100V	#2730
110V	#2805	115V	#9901
123.5V	#2811	200V	#2732
200V	#2806	220V	#2803
220V	#2813		
235V	#2814		

See M3203-3 pages for 3-phase power requirements.

- Power Cords: One must be specified.

50 Hz cord without plug - #2760
60 Hz cord without plug - #2762

- Color Group: Blue is supplied as standard.
- Language Group: One must be specified.

French	#2970	Span. Speak	#2969
Int'l	#2950	Swedish	#2967

Note: Not recommended for field installation.

- International Print Support (#9351): Provides support for modified AN, PN and SN Print Train Arrangements for the 1416 Interchangeable Train Cartridge corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PCS-HN, 107- and 127-character Katakana Print Train Arrangements. See "Type Catalog". Not recommended for field installation. Replaces standard print support.
- Cabling: Fixed-length cables are supplied as standard. Refer to "Installation Manual-Physical Planning", GA27-3006 (Canada only) and to "Customer Site Preparation Planning Guide", GA27-3103. <
- (Canada only) EIA RS-232-C 19.2K bps Line Speed: #9481 provides support of 19.2K bps. Provides diagnostics <

SPECIAL FEATURES

Communication Features

Communication Driver Without Business Machine Clocking (#1481): (Required) Provides communication driver without clocking. Maximum: One. Field Installation: Yes.

CCITT-V.35 Interface (#2911): Provides a cable and interface compatible with CCITT-V.35 recommendations for attachment of Data Communication Equipment (see M2700 pages). Speed of (Except Canada > 20.4K <) (Canada only > 19.2K <) bps is permitted. Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150m (491 ft). Limitations: Cannot be installed with #3701, #4501.

Contact IBM for information. Field Installation: Yes. Prerequisites: Communication Driver without Clocking (#1481).

EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps

to 9600 bps and at 19.2K bps are permitted. Limitations: Cannot be installed with High Speed Digital Interface (#4501), DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multipoint (#5651) or V.35 Interface (#4720). (Canada only) Maximum: One. Prerequisites: For 19.2K bps operation, #9481 is required see item under "Specify". <

(Except Canada > CCITT-V.24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V.24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 pages). Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds from 2400 bps to 9600 bps are permitted. Limitations: Cannot be installed with #4501 or #2911.

Maximum: One. Field Installation: Yes. Prerequisites: Communication Driver (#1481). < (Japan only) Specify: #2946 for NTTPC Self-Test for use with DCE that is attached under the provisions of the IBM Multiple Supplier Systems Policy. <

High-Speed Digital Interface (#4501): Provides an interface and a cable for attachment to a modem which permits point-to-point synchronous operation at (Canada only > 19.2K bps on a Type 5703 or 8803 wideband <) (Except Canada > 20.4K bps on a broadband <) channel. Limitations: Cannot be installed with #3701 or #2911. Maximum: One. Field Installation: Yes. Prerequisites: #1481.

Non-Communication Features

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One. Field Installation: Yes.

Console Display (#1601): Provides a 1024-character (16 lines of 64 characters each) console information display. Maximum: One. Field Installation: Yes.

Console Display Spooling (#1602): Diskette storage device for spooling of console display messages. One device with a customer removable diskette placed in the left cabinet. Additional diskettes are available from IBM. Contact IBM. Maximum: One. Field Installation: Yes. Prerequisites: #1601.

Diskette Input Device (#3201): Diskette storage device for reading of card image Basic Exchange Datasets. One device with a customer removable diskette placed in the right cabinet. Additional diskettes are available from IBM. Contact IBM. Maximum: One. Field Installation: Yes.

Door Keylock (#3401): Provides one keylock and two keys for the desk console cabinet door. Limitations: The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes.

Door Keylock Dual (#3402): Provides two Keylocks and four identical keys for both desk-console cabinet doors. Limitations: The keys provided with this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes. Prerequisites: #3201.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. Refer to "Accessories" for information on additional or replacement keys. Maximum: One. Field Installation: Yes.

Operator ID Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 inches x 2-1/8 inches ranging from 0.007 inches to 0.045 inches thick may be read. Contact IBM for magnetically striped and encoded identification cards. A read operation can be initiated during an operator inquiry (SYSREQ function). Data read from the magnetic stripe card cannot be printed, displayed or

MACHINES

written on the Console Display Spooling diskette. Limitations: (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming does not support this feature. Maximum: One. Field Installation: Yes. Prerequisites: #1601.

Print Speed Enhancement (#5595): Provides support for 3203 mdl 3 Printer operating with 1200 lpm Speed Enhancement feature (#6360). Maximum: One. Field Installation: Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader mdl A1, A2 or A3. Maximum: One. Field Installation: Yes.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. Limitations: The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

The following model upgrades are field installable:

- Mdl 1 to mdl 2
- Mdl 2 to mdl 3 (Canada only > ** <)

(Canada only > ** When upgrading a mdl 2 to a mdl 3, it is assumed that the mdl 2 has Special Features #1601 (Console Display) and

#1602 (Console Display Spooling) installed. If they are not, an RPQ must be submitted. <)

Note: Customer price quotations and customer order acknowledgement letters for purchase MESS must state: "Installation of this mdl change involves removal of parts which become the property of IBM."

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with machine, order the P/N indicated below.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of one year under normal conditions, and can be expected to provide 3.5 years of normal operation. Note: Discharged battery should be returned to IBM.

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

Ribbons: For 3203 mdl 3 ribbons, contact IBM.

3777 COMMUNICATION TERMINAL MODEL 3

PURPOSE

The 3777 mdl 3 is a high-speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3777 mdl 3 is an SNA Multiple Logical Unit (MLU) terminal. A keyboard and console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal setups and local utility programs in terminal storage for use by the terminal operator. The 3777 is not designed as an interactive terminal. The printer is not integrated into the 3777 mdl 3 but is a stand-alone 3203 Printer mdl 3 which is cable-attached to the 3777 mdl 3. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operates at 50 cpm. A minimum configuration includes a 3777 mdl 3 Communication Terminal and a 3203 mdl 3 Printer.

MODEL 3

Maximum Lines Per Minute

Standard 3203-3	Featured 3203-3	Character Set
1000	1200	48 AN, PN
998	1195	52 PN
870	1020	60 PN
717	815	107 Katakana
530	585	127 Katakana

Note: Katakana character set print speeds are dependent upon the frequency of preferred character subsets.

See "Type Catalog" for additional character sets and speeds. See M3203 for 1200 lpm Speed Enhancement feature information.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard, console display and terminal storage are standard. The 3203 and 3262 Printers are stand-alone units. A minimum configuration includes a 3777 mdl 3 Communication Terminal and a 3203 Printer mdl 3. For other configurations refer to "Special Features" below. The duplex data communications capability of the 3776-3, -4, 3777-3 is operational on nonswitched full-duplex communications facilities only.

Prerequisites: For SDLC Communications with S/370 or a 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 processor or 4300 processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, POWER/VS and VTAM.

Note: 4300 MVS and JES2-3 support is limited to 4341 4361 or 4381 Processors.

An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for duplex data stream operation.

HIGHLIGHTS

- **Communications:** Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps are provided using the appropriate modems and communications facilities. Duplex -- simultaneous inbound/outbound -- data transmission is provided on nonswitched full-duplex communication facilities only when communicating with an appropriately equipped 3705 or 3725 Communication Control-

ler with the supporting ACF/NCP/VS level. May also be locally attached in either a Duplex or Half-Duplex mode to a 3705 at 14.4K bps or a 3725 at 19.2K bps.

- **Keyboard:** EBCDIC arrangement with (Canada only > 44 data keys. <) (Except Canada > 47 data keys for all countries except United Kingdom and Japan (Katakana). United Kingdom and Japan Katakana use 48 data keys. <) The keyboard in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Advance are non-destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.
- **Console Display:** Contains 16 lines of 64 characters each for a total of 1,024 characters. The 3777 mdl 3 reserves the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input.

Lower case alphabets are converted to upper case before displaying. Katakana machines provide for upper case Katakana characters only. When the cursor is beneath a character any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted.

Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time the operator is prompted to specify date and time. As messages are received they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the "greater than" symbol in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

- **Printer:** A stand-alone 3203 Printer mdl 3 cable attached to the 3777 mdl 3. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 3 supports 15 Print Train Arrangements (AN, HN, OAA, ODA, ONA, OAB, GN, PCS-AN, PCS-HN, PN, QNC, QN, RN, SN, RN) as standard. When a substitute character is ordered to displace a character in one of the standard arrangements, the substitute character assumes the card and bit codes of the character it replaces. See "Type Catalog" pages. International Print Support is provided supporting Print Train Arrangements corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PCS-HN, 107 and 127 character Katakana arrangements. The 3203 mdl 3 permits feeding continuous forms up to 20 inches wide and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch under operator control. Maximum forms length is 24 inches when attached to the 3777 mdl 3. Refer to 3203 for further description of the 3203 mdl 3. Refer to "Type Catalog" for further description of the 1416 print train arrangements supported

and for print speeds. Refer to GA24-3488 for forms design considerations.

- **Terminal Storage:** Is standard for message spooling, terminal control, utility programs and user-generated procedures.
- **Diskette Storage:** There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3777 mdl 1, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used locally for input or output. Diskette operation is concurrent with other terminal functions.
- **Magnetic Tape:** May be used as either an input or as an output device. One 3411 mdl 1 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411 mdl 1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. 7-Track tape operation is not provided. The 3411 mdl 1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed- or variable-length and may be unblocked or blocked to a maximum block size of 4,000 bytes. Maximum record size is 255 bytes. A block size of up to 2,000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal functions. Refer to G232-0004 for detailed information on operation of the 3411 Magnetic Tape Unit and Control. Refer to M3411 pages for ordering information, #7003 is prerequisite for attachment.
- **Buffers:** Transfer data between the input and output devices and the communication line. SDLC communications uses a customer defined Request/Response Unit (RU) of up to 512 bytes. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. The buffers also transfer data between input and output devices during local operation.
- **Printer Format Controls:** Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.
- **Compression/Expansion:** Implementation provides a compression option at the terminal for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequences to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received. The option, when exercised, is unique to the individual associated session and output device.
- **Decompression:** Provides the decompression function associated with the receipt of a compacted data stream whereby a pair of consecutive alphanumeric characters is represented by a single transmission byte. Function is dependent upon transmission by the host of a decompression table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompression occurs for data directed to the printer, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided. The function is an option exercised and performed by the 3777 terminal and may be unique to each associated session and output device.
- **Automatic Card Reading:** Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.

- **Job Control:** Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local utility jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printer, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printer, Diskette, Card Punch
Diskette	Printer, Magnetic Tape, Diskette, Card Punch

- **Record Formats:** Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape data sets, are also applicable to diskette as a function of Basic Exchange data sets (128 byte maximum).

Basic Exchange diskettes may be read by the terminal. Basic exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control. Input record size from both magnetic tape and diskette may be limited to 80 or 128 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

- **Remote Power Off:** This feature can be used to conserve energy used by the terminal by providing the capability for the host CPU application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated. The 3262 Line Printer requires manual powering down.
- **Encrypt/Decrypt Feature:** Available to provide secure data transmission in conjunction with ACF VTAM Encrypt/Decrypt Feature 5735-RC2, feature #6010 and Programmed Cryptographic Facility Program Product 5740-XY5.

Performance Considerations: The line-to-printer performance of the 3777 mdl 3 and attached 3203 mdl 3 is up to 1,000 lpm (up to 1,200 lpm with 3203 mdl 3 Speed Enhancement feature #6360) on the 3203 mdl 3 and Print Speed Enhancement (#5595) on the 3777 mdl 3 with 48-character AN or HN set, and up to 870 lpm (up to 1,020 lpm with 3203 mdl 3 Speed Enhancement feature) with a 60-character PN set. For other speeds, see the "3770 Data Communication System", GA27-3097.

The 3777 mdl 3 MLU terminal will operate, however, with concurrent input-output processing in either a Duplex or Half-Duplex data communications mode as a function of the Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations.

The degree of degradation which may occur will tend to be greater when Half-Duplex communications are employed as opposed to

Duplex communications and System facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, SNA pacing, and cryptographic processing, must all be considered in determining actual throughput. See "3776 and 3777 Component Description Manual", GA27-3145, for additional information.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half-Duplex communications mode. The 3777 mdl 3 operating Duplex (Canada only > 19.2K <) (Except Canada > 20.4K <) bps on a terrestrial link may however present a variance of from greater to degraded overall terminal throughput when compared to comparable operation in Half-Duplex mode. Reference the "Component Description Manual for the IBM 3776/3777 Communication Terminals", GA27-3145, for specific performance considerations.

Problem Determination Procedures: Function has been designed into this unit to help provide availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See "IBM 3770 Multiple Logical Unit Operator's Guide for the 3776-3, 3776-4, 3777-3", GA27-3165.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700, 3203 and 3262 pages.

Communications: See "Special Features". Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps. Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 4800 bps are nonswitched facilities. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. EBCDIC is the standard transmission code. (Canada only > ASCII is available as a special feature on the 3777 and by RPQ on the 3262. <) Refer to M2700 pages for information on customer responsibilities, communication facilities and other attachment information.

(Canada only > For 19.2K bps, the 3777 mdl 3 may use either the EIA Interface (#3701) or the High-Speed Digital Interface (#4501) to communicate through an appropriate modem and communication facility with a 3704/3705 Communication Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection and which provide optional EIA RS-232-C or High-Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature (#1601) on the 4331 Processor. The 4331 must be equipped with a Local Attachment Interface (#4801) and its prerequisites see "Special Features" in M4331 pages. <)

IBM Modems	Speed (bps)
3863	2400
3868 mdl 1	2400
3864	4800
3868 mdl 2	4800
3865	9600
3868 mdl 3,4	9600

Note: 4-Wire Switched Network Backup is available on 3863 mdl 1, 3864 mdl 1 or 3865 mdls 1 or 2. For communications capability, product utilization and features, see M3863, 3864 and 3865 pages.

Communications Adapter: An integrated communications adapter without business machine clocking is standard. It provides SDLC communications over switched or nonswitched facilities.

Publications: GC20-0001

SPECIFY

- (Canada only > Voltage (115V AC, 1-phase, 3-wire, 60 Hz): #9880 for locking plug, or #9881 for non-locking plug. See M3203, 3262 and 3411 for their power requirements. <)
- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	220V #2803
220V #2813	
235V #2814	

See M3203-3 for 3-phase power requirements.

See M3411 for Magnetic Tape Unit power requirements.

- Power Cords: One must be specified.
 - 50 Hz cord without plug #2760
 - 60 Hz cord without plug #2762
- Color Group: Blue is supplied as standard (no specify required).
- Language Group: One must be specified.

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931

Note: Not recommended for field installation.

- Keyboard Arrangement: One must be specified.

Belgian #2971	Italian #2968
Brazilian #2975	Japanese #2955
English UK #2958	Japan Katakana #2973
French #2970	Spanish #2960
German #2957	Span Speak #2969
Int'l #2950	

Note: Not recommended for field installation.

- Cables: Fixed-length cables except for the 3602 and the 3411 Magnetic Tape are supplied as standard. Refer to "Installation Manual-Physical Planning", GA27-3006. 3411 cables must be separately ordered.
- (Canada only > EIA RS-232-C 19.2K bps Line Speed: #9481 provides support of 19.2K bps. Provides diagnostics and used for record purposes. <)
- (Canada only > Alternate Address: #9011 for record purposes only. Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by CE using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location. <)

SPECIAL FEATURES

(Canada only > ASCII Feature (#1201): A 48-data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). Orders for #1201 must also specify one print belt, #9493 for 48-character ASCII, #9494 for 64-character ASCII, or #9495 for 94-character ASCII. Maximum: One. Field Installation: Not recommended. Note: ASCII on the 3262 requires an RPQ see M3262 pages. <)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One. Field Installation: Yes.

CCITT-V.35 Interface (#2911): Provides a cable and interface compatible with CCITT-V.35 recommendations for attachment of Data Communication Equipment (see M2700 pages). Speed of 20.4K bps is permitted. Required for direct High Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150m (491 ft). Limitations: Cannot be installed with #3701, #4501 or #5655.

Field Installation: Yes.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. Limitation: The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. Limitation: The keys provided with this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. Maximum: One. Field Installation: Yes. Prerequisites: #4902.

Encrypt/Decrypt (#3680): Provides cryptographic data transmission in conjunction with program support in the host. Includes a security keylock. Each machine will have its own unique key. Two identical keys are supplied with the feature. Maximum: One. Field Installation: Yes. Note: A mercury battery, P/N 1743456 or equivalent, is required. A battery is shipped with this feature. See "Accessories" for additional or replacement battery. Replacement of the discharged battery is the customer's responsibility.

(Canada only) EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. Limitations: Cannot be installed with High-Speed Digital Interface (#4501), DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multi-point (#5651) or V.35 Interface (#4720). Maximum: One. Prerequisites: For 19.2K bps operation, #9481 is required see item under "Specify".<)

(Except Canada) CCITT-V.24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V.24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, ABC V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 pages). Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds from 2400 bps to 9600 bps are permitted.<) (Japan only) Specify: #2946 for NTPC Self-Test for use with DCE that is attached under the provision of the IBM Multiple Supplier Systems Policy.<) (Except Canada) Limitations: Cannot be installed with #4501 or #2911.<) (Except Canada) Limitations: Cannot be installed with #4501, #2911 or #5655.<)

(Except Canada) Maximum: One. Field Installation: Yes.<)

High-Speed Digital Interface (#4501): Provides a cable and interface for attachment to a modem which permits point-to-point synchronous operation at (Canada only) 19.2K bps on a Type 5703 or 8803 wideband<) (Except Canada) 20.4K bps on a broadband<) channel. Limitations: Cannot be installed with (Canada only) EIA Interface (#3701), V.35 Interface (#4720)<) CCITT V.24/28 Interface (#3701) or CCITT V.35 Interface (#2911) or X.21 Adapter for Non-switched Networks (#5655). Maximum: One. Field Installation: Yes.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to keyboard or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. Refer to "Accessories" for information on additional or replacement keys. Maximum: One. Field Installation: Yes.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: One movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange data set or in a 3770 format dataset. Diskette capabilities allow for:

- Concatenate (pool) - the ability to concatenate on a data set basis.
- Multi-Volume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive.

Maximum: One. Field Installation: Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Copy - Data can be copied from diskette 1 to diskette 2. Maximum: One. Field Installation: Yes. Prerequisites: #4901.

Operator Identification Reader (#5450): Reads 40 characters (of which 37 are discretionary) from magnetic-stripe cards which are encoded in the ABA format. Each character contains four bits plus odd parity. Card size is 3-3/8 inches by 2-1/8 inches ranging from 0.007 inches to 0.045 inches thick may be read. Data read from the magnetic stripe card cannot be printed or displayed. Limitations: The operator must position and slide the card through the reader-slot at a steady rate of between 5 and 40 inches per second for a read operation. Maximum: One. Field Installation: Yes.

Print Speed Enhancement (#5595): Provides support for 3203 Printer mdl 3 operating with 1,200 lpm Speed Enhancement feature (#6360). Maximum: One. Field Installation: Yes.

(Japan only) X.21 Adapter For Nonswitched Networks (#5655): X.21 adapter for Nonswitched Networks (#5655) provides a cable and interface meeting CCITT-X.21 characteristics for attachment of data communication equipment. Feature operates only over non-switched lines using SDLC procedures. Speeds of 2400, 4800 or 9600 bps are permitted. Limitations: Not with #3701, #2911 or #4501 DDC Nonswitched Network only. Maximum: One. Specify: Record purposes only. #9822 for 2400 bps, #9823 for 4800 bps, or #9825 for 9600 bps.<)

3411-1 Magnetic Tape Unit And Control Attachment (#7801): To attach one 3411-1 Magnetic Tape Unit and Control. Maximum: One. Prerequisites: #7003 on 3411 mdl 1. Field Installation: Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader mdl A1, A2 or A3. Limitations: OMR is not supported. Maximum: One. Field Installation: Yes.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. Limitations: The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One. Field Installation: Yes.

ACCESSORIES

(Except Canada) Accessories are available on a "purchase-only" basis. For shipment with machine, order P/N indicated below.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of one year under normal conditions and can be expected to provide 3.5 years of normal operation. Note: Discharged battery should be returned to IBM.<)

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be

IBM IBM Canada Ltd.

MACHINES

FEB 87

obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

SUPPLIES

For 3203 mdl 3 ribbons, contact IBM.

3777 COMMUNICATION TERMINAL MODEL 4

PURPOSE

The 3777 mdl 4 is a high-speed remote job entry terminal providing an SNA Multiple Logical Unit (MLU). A keyboard and console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal setups and local utility programs in terminal storage for use by the terminal operator. The 3777 is not designed as an interactive terminal. The printer is not integrated into the 3777 mdl 4 but is a stand-alone IBM 3262 mdl 2 or 12 Printer which is cable attached to the 3777 mdl 4. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader, one card punch and an additional printer. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operated at 50 cpm. A minimum configuration includes a 3777 mdl 4 Communication Terminal and a 3262 mdl 2 or 12 Printer.

MODEL 4

3262 Nominal Rated Speed (LPM)

Character Set	Mdl 2	Mdl 12
48 Character (AN)	650	325
64 Character	467	230
96 Character	364	180
63 Optimized	625 (max)	310 (max)

Limitations: The input/output capabilities outlines under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard, console display and terminal storage are standard. The 3262 Printer is a standalone unit. A minimum configuration includes a 3777 mdl 4 Communication Terminal with the appropriate communications capabilities and a 3262 Printer. For other configurations refer to "Special Features" below. The duplex data communications capability of the 3777 mdl 4 is operational on nonswitched full duplex communications facilities only.

Prerequisites: For SDLC Communications With S/370 or a 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 Processor or 4300 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, Power/VS and VTAM.

Note: 4300 MVS and JES2-3 support is limited to 4341, 4361 or 4381 Processors.

An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for Duplex data stream operation.

HIGHLIGHTS

- Communications: Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) bps are provided via an integrated communications adapter using the appropriate modems and communications facilities. Duplex - simultaneous inbound/outbound - data transmission is provided on nonswitched full duplex communication facilities only when communicating with an appropriately equipped 3705 or 3725 Communication Controller with the supporting ACF/NCP/VS level.
- Keyboard: EBCDIC arrangement with 47 data keys for all countries. The keyboard in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character

Advance may be used for editing. Character Backspace and Character Advance are non destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.

- Console Display: Contains 16 lines of 64 characters each for a total of 1024 characters. The 3777 mdl 4 reserves the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input.

Lower case alphabetic are converted to upper case before displaying. When the cursor is beneath a character, any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted.

Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time the operator is prompted to specify date and time. As messages are received they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the Greater Than sign in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

- Printer: The 3262 is a standalone unit providing 132 print positions. Horizontal spacing is 10 characters per inch (25.4 mm). Vertical spacing is limited to 6 or 8 lines per inch (25.4 mm). Forms skipping and spacing are program controlled within the 3262, and is optimized by the 3777 to provide the closest comparison possible with the other 3776/3777 MLU models and their associated programming interfaces.

There are character set variations forms control variations between the 3262 and the other printers associated with the IBM 3776/3777. The user should refer to the "3776/3777 Component Description Manual" (GA27-3145) and the "Forms Design Reference Guide for Printers" (GA24-3488) for the specific variations. Refer to M3262 for ordering information.

- Second Printer Attachment: Adding a second printer to the 3777 mdl 4 will yield a higher output to the 3777. As an example:

3262 Mdl 2	Second Printer		48 Character Nominal Rated (LPM)
	3262 Mdl 2	3262 Mdl 12	
650			650
650		325	975
650	650		1300

- Terminal Storage: Is standard for message spooling, terminal control, utility programs and user generated procedures.
- Diskette Storage: There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3777 mdl 1, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned indi-

vidually to an independent host SNA session or used logically for input or output. Diskette operation is concurrent with other terminal functions.

- **Magnetic Tape:** May be used as either an input or as an output device. One 3411 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411 mdl 1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. Seven track tape operation is not provided. The 3411 mdl 1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed or variable length and may be unblocked or blocked to a maximum block size of 4,000 bytes. Maximum record size is 255 bytes. A block size of up to 2,000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal functions. Refer to G232-0004 for detailed information on operation of the 3411 Magnetic Tape Unit and Control. Refer to M3411 for ordering information, #7003 is prerequisite on 3411 mdl 1 for attachment to 3777.
- **Buffers:** Transfer data between the input and output devices and the communication line. SDLC communications uses a customer defined Request/Response Unit (RU) of 256 or 512 byte buffers. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. The buffers are used for transferring data between input and output devices during local operation.
- **Printer Format Controls:** Printer Format Controls Facilitate the formatting of printed data. Vertical control characters in data initiate vertical tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.
- **Compression/Expansion:** Implementation in the 3777 mdl 4 by providing a terminal option for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequences to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received. The option, when exercised, is unique to the individual associated session and output device.
- **Decompression:** Provides the decompression function associated with the receipt of a compacted data stream whereby a pair of consecutive alphanumeric characters is represented by a single transmission byte. Function is dependent upon transmission by the host of a decompression table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompression occurs for data directed the printers, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided. The function is an option exercised and performed by the 3777 terminal and may be unique to each associated session and output device.

Automatic Card Reading Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.

- **Job Control:** Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette, or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

- **Local Utility:** Jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printers, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printers, Diskette, Card Punch
Diskette(s)	Printers, Magnetic Tape, Diskette, Card Punch

- **Record Formats:** Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape datasets, are also applicable to diskette as a function of Basic Exchange datasets (128 byte maximum). Basic Exchange diskettes may be read by the terminal. Basic exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 128 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

- **Remote Power Off:** This function can be used to conserve energy via the capability of the user written host CPU application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. This capability is in addition to the standard power down switch which can be manually operated. Note: The 3262 Line Printer requires manual powering down.
- **Performance Considerations:** The line to printer performance of the 3777 mdl 4 and attached 3262 mdl 2 is up to 650 lpm with 48 character set. For other speeds see M3262.

The 3777 mdl 4 MLU terminal will operate, however, with concurrent input-output processing in either a Duplex of Half Duplex data communications mode as a function of the Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations.

The degree of degradation which may occur will tend to be greater when Half Duplex communications are employed as opposed to Duplex communications and System facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half Duplex communications mode. The 3777 mdl 4 operating Duplex (Canada only > 19.2K <) (Except Canada > 20.4K <) bps on a terrestrial link may, however, present a variance of from to greater degraded overall terminal throughput when compared to comparable operation in Half Duplex mode. Reference the "Component Description Manual for the IBM 3776/3777 Communication Terminals", (GA27-3145), for specific performance considerations.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression/compaction characteristics, characters read/printed, forms skipping, application processing, and SNA pacing, must all be considered in determining actual through-

put. See "IBM Component Description 3776 and 3777 Manual", GA27-3145, for additional information.

(Except Japan > Problem Determination Procedures: Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See "IBM 3777 Model 4, Communications Terminal Operator's Guide", (GA27-3309).<)

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 and M3262 pages. The 3262 is designated as Customer Setup Unit (CSU).

Communications: See Special Features. Transmission speeds from 2400 bps to 9600 bps and at (Canada only > 19.2K <) (Except Canada > 20.4K <) Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 9600 bps are nonswitched facilities. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

IBM Modems	Speed (bps)
3863	2400
3868 mdl 1	2400
3864	4800
3868 mdl 2	4800
3865	9600
3868 mdl 3,4	9600

Note: 4 Wire Switched Network Backup is available on 3863, 3864 and 3865. For Communications capability, product utilization and features, see M3863, M3864 and M3865 pages.

Publications: GC 20-0001

SPECIFY

- Power (AC, 1-phase): One must be specified.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	220V #2803
220V #2813

See M3262 for power requirements.

See M3411 for Magnetic Tape Unit power requirements.

- Power Cords: One must be specified.

50 Hz cord without plug - #2760
60 Hz cord without plug - #2762

- Color Group: Blue is supplied as standard (do not specify).
- Language Group: One must be specified.

English #2927	Italian #2932
French #2928	Spanish #2931
German #2929	

Note: Not recommended for field installation.

- Keyboard Arrangement: One must be specified.

Aust./German #2957	Italian #2968
Belgian #2971	Norwegian #2966
Brazilian #2975	Portuguese #2959

Danish	#2965	Spanish	#2960
English UK	#2958	Span Speak	#2969
Finnish	#2963	Swedish	#2967
French	#2970		
International	#2950		

Note: Not recommended for field installation.

- Cabling: All cables are supplied with fixed lengths with 3777 shipment except the 3411 Magnetic Tape and the 3262 Printer. Refer to "Installation Manual-Physical Planning", GA27-3006. 3411 cables must be separately ordered (see M3411). The 3262 provides a 1.8m (6 ft) standard or 4.3m (14 ft) optionally specified Signal Cable (#9405) which connects to the 3777 mdl 4. The 3262 Customer Set-Up (CSU) must be performed prior to installation of the 3777 mdl 4.
- (Canada only > EIA RS-232-C 19.2K bps Line Speed: #9481 provides support of 19.2K bps. <)

SPECIAL FEATURES

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. Maximum: One. Field Installation: Yes.

CCITT-V35 Interface (#2911): Provides a cable and interface compatible with CCITT-V35 recommendations for attachment of Data Communication Equipment (see M2700 pages). Speed of 20.4K bps is permitted. Required for direct High Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150m (491 ft). Limitations: Cannot be installed with #3701 or #5655.

Maximum: One. Field Installation: Yes.

CCITT-V24/28 Interface (#3701): Provides a cable and interface compatible with CCITT-V24/28 recommendations for attachment of an external IBM modem or PTT mandatory modem complying with CCITT Recommendations (1976) V.24, V.28, ISO Standard 2110 and other relevant CCITT Recommendations (refer to M2700 pages). Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Speeds from 2400 bps to 9600 bps are permitted. Limitations: Cannot be installed with #2911 or #5655.

Maximum: One. Field Installation: Yes.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operations related to keyboard or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. Refer to "Accessories" for information on additional or replacement keys. Maximum: One. Field Installation: Yes.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Characteristics of the diskette storage device are: One movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1,898 128-byte records. Data may be stored in either a Basic Exchange dataset or in a 3770 format dataset. Diskette capabilities allow for:

- Concatenate - the ability to concatenate on a data set basis.
- Multi-Volume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive.

Maximum: One. Field Installation: Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Data can be copied from diskette 1 to diskette 2 or vice-versa. Maximum: One. Field Installation: Yes. Prerequisites: Diskette Storage, 1st (#4901).

Second Printer Attachment (#6302): Supports the attachment of a second 3262 Printer. Either a Mdl 2 or a Mdl 12 may be attached. Maximum: One.

3411-1 Magnetic Tape Unit And Control Attachment (#7801): To attach one 3411-1 Magnetic Tape Unit and Control. Maximum: One. Field Installation: Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader Model A1, A2 or A3. Limitations: OMR is not supported. Maximum: One. Field Installation: Yes.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Model 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. Limitations: The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

Field conversion is possible from mdl 3 to mdl 4.

ACCESSORIES

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order.

SUPPLIES

For 3262 Belts and Ribbons, see M3262 pages. For 3203 mdl 3 ribbons, contact IBM.

3780 DATA COMMUNICATIONS TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

A data transmission terminal using the BSC technique. It can communicate over appropriate communications facilities to another 3780, a S/360 models 22 through 195, any S/370 processor, any 30XX processor, or a 2780 Data Transmission Terminal. May be locally attached to a 3704/3705 Communications Controller. Communication is also possible with the 4300 processors via channel attached 2701, 3704, 3705 or via a Communications Adapter on the 4331 or 4361. For requirements, see "Prerequisites".

MODELS

Model 1 001

Prerequisites:

S/360 mdl 25 ... communications can be via the Integrated Communications Attachment (#4580) with appropriate binary synchronous features on the 2025, or via a 2701 Data Adapter Unit or 2703 Transmission Control ... see below.

S/360 mdls 22 through 195 (except mdl 44 or 67 in TSS mode), any S/370 processor, or any 30XX processor... communications can be via a 2701 Data Adapter Unit or 2703 Transmission Control equipped with appropriate binary synchronous features ... see M2701, 2703 pages. **Notes:** [1] To utilize OLT support, the host processor requires a minimum of 32K bytes of storage ... [2] The 3780 communicates only in EBCDIC or ASCII codes ... [3] Only EBCDIC Transparency (#3601) is available on the 3780. Therefore, a 2701 or 2703 must be configured with 3780 restrictions and limitations for compatibility ... [4] All 3780s on a multipoint line must have the same code, EBCDIC or ASCII.

S/360 (except mdls 22, 25, 44, 67 in TSS mode, or 85), any S/370 processor, or any 30XX processor ... communications can be via a 3704/3705 Communications Controller. **Note:** See the 3704 and 3705 Machines and Programming pages for attachment capability and refer to Host System Programming pages for possible restrictions to any of the above attachments.

S/370 mdls 115, 125, 135, 135-3, 138 ... communications can be via the Integrated Communications Adapter (#4640) and appropriate binary synchronous features on the 3115, 3125, 3135, 3135-3, 3138 as well as via a 2701, 2703 or 3704/3705. Communication is also possible with the 4300 processors via channel attached 2701, 3704 or 3705; or via a Communications Adapter on the 4331 and 4361 processor.

3704/3705 Medium Speed Local Attachment ... attachment without modem at speeds up to 2400 bps via IBM-provided cables. Requires #7705 ... see "Specify".

Another 3780 ... communications require (#9711) and the same (#9761 or #9762) on both units ... see "Specify".

2780 Data Transmission Terminal ... [mdls 1, 2, 4] communications require that both terminals have #9761 on 3780, #9762 on 2780 and #3601 on 3780, #8030 on 2780. Communications can be in EBCDIC Transparency mode only. The 3780 may not have multiple records in Transparent mode.

HIGHLIGHTS

Provides medium-speed, batch-oriented, buffered card reading and printing via appropriate communications facilities ... see "Communications Facilities". Punched card output is provided via attachment of a 3781 Card Punch ... see M3781 pages.

Card Reader: Reads at a rated speed of 600 cards/minute. Provides hopper capacity of 1200 cards and stacker capacity of 1300 cards. Only 80-column cards can be read.

Printing: Prints at a rated speed of 350 lines/minute utilizing the basic 52-character set. Interchangeable type bars of 39- and 63-character sets are available with rated speeds of 425 lpm and 300 lpm, respectively. Only the 63-character set may be employed when using ASCII transmission code. The printer provides 120 print positions standard with feature expansion to 144 positions ... see "Special Features". Horizontal and vertical format control are provided as standard functions of the printer.

Buffers: Provides two 512-character buffers which service the transmission line and the I/O units alternately to provide overlap operation for efficiency.

Buffer Checking: All characters are checked on the data path when sent to or received from the buffer.

Variable Record Length: End-to-end characters are used to define the end of a record, allowing for complete variable length. Full buffer-blocks with variable-length records can be transmitted or received. On card transmission, blank positions are removed from the end of the card record to increase the transmission efficiency.

Space Compression/Expansion: Operable under switch control, this capability provides for the removal of consecutive spaces in transmitted data and their re-insertion in received data. A 2-character sequence is substituted for from two to 63 consecutive spaces. If more than 63 consecutive spaces are to be transmitted, a second 2-character sequence will be substituted for the number of consecutive spaces greater than 63. If only one space is to be transmitted, it will be transmitted as a normal space. This feature is inoperable when transmitting in transparency mode or operating in home mode.

Home Mode: Provides card reader-to-buffer-to-printer operation in an offline non-communications mode.

Integrated 2400/1200 bps Modem: Provides 2400 bps transmission with half-speed backup on leased voice grade facilities ... compatible with 3872 modem.

Conversation Mode: Allows a CPU to turn the communications line around after receiving text and return text without additional selection.

Audible Alarm: Alerts the operator when manual intervention is required in line mode ... unattended operation is not provided.

Speed Select Switch: A switch allowing the control of switched network operation at either 600 or 1200 bps.

Communications Facilities: The 3780 operates in half-duplex mode over the types of facilities listed below ... for information concerning these facilities, see M2700 pages.

- PTT Public Switched Telephone Networks
- PTT Nonswitched Voice Grade lines
- PTT Public Switched Data Networks
- Privately owned communication facilities
- PTT Public Nonswitched Data Networks

Notes: When operating at 2400 bps on PTT-supplied switched or nonswitched facilities, there may be additional restrictions and limitations to the facility and the operation. For details, see *Bisynchronous General Information Manual* (GA27-3004). When operating at speeds above 2400 bps to 7200 bps, the facility requirements may vary by data set (modem) type. The data set (modem) manufacturer should provide this information to the customer at his request.

Binary Synchronous Transmission: Allows for transmission rates of 1200, 2000, 2400, 4800, 7200/3600 bps ... see "Modems" below and "Data Set Attachment" under "Specify". Communications can be with another 3780, a 2780 mdl 1, 2 or 4, a S/360 mdls 22 through 195 (except mdl 44 or mdl 67 in TSS mode), or any S/370 Processor. Communication is also possible with the 4300 processors via channel attached 2701, 3704 or 3705; or via a Communications Adapter on the 4331. For requirements, see "Prerequisites". In addition, the 3780 may be multidropped on the same line facility with other BSC devices (1826, 2715, 2780, 3271, 3275, 3735) as tributary stations on a multipoint line with a S/360 mdls 22-195 (except mdl 44 or mdl 67 in TSS mode), any 4300 processor or any S/370 processor as the control station. In a switched control network, it may use the same termination (phone number) at the computer that is used for the other BSC devices.

Transmission Code: One of two codes can be selected ... see "Specify". For printable graphics, see "Type Catalog" pages.

EBCDIC Code: 256-character set, which is the basic code of S/360 and S/370.

ASCII Code: Industry standard code with a 128-character set.

Transmission Checking: A redundancy check is performed on all data. EBCDIC uses a 16-bit cyclic check transmitted as two 8-bit bytes ... ASCII uses an odd-parity VRC on each character, including the LRC character and an LRC check transmitted as a single 8-bit odd parity byte. Format check plus an odd/even block check is provided on both code sets.

Modems: One Integrated 2400/1200 bps modem feature, 3863 (2400 bps) modem, 3864 (4800 bps) modem, 3872 modem (2400/1200), can be attached to the 3780. For communications capabilities, product utilization, and special features, see M2700, 3863, 3864, 3872 pages and "Integrated Modem" under "Special Features" below.

3780 Data Communications Terminal (cont'd)

Card Limitations: Generally, scored cards require careful handling and a favorable environment. Use of the following scores has been approved:

Internal Scores (before separation): M-4, M-5, OM-2, OM-3, S-1 and ID-3. Two sizes only, 2 x 3-1/4 inches or 2-3/16 x 3-3/4 inches. **Note:** When using OM-2 or OM-3, reading must be terminated prior to the scored column.

External Scores (after separation): M-3, M-4, M-5, M-6, M-7, M-11, OM-2, CF-4 and CF-11. OM-3 may be used if the score is on the column 1 end. **Note:** Upper left corner cut required when the M-11 or CF-11 is used on the column 1 end.

All other scores may result in unsatisfactory performance. For possible use of Port-A-Punch® or Micro-Processing cards, consult IBM. Aqua cards and C-4 corner cut cards cannot be used.

Customer Responsibilities: See M2700 pages. In addition, the customer must be advised that when non-IBM data sets or privately owned communications facilities are used, he is responsible for ensuring that signal levels and impedances are compatible with the IBM communications interface.

Publications: GA24-3089

220V #2813	230V #9904
235V #2814	

- Transmission Code: **#9761** for EBCDIC, **#9762** for ASCII. **Field Installation:** Yes.
- Character Set: One of the available character sets and the type size must be specified (no charge) on the initial order ... see "Type Catalog" pages for specified characters in each set and price for additional sets.
- Printer Tape Punch: Order under P/N 120910 on MES
... one punch is furnished per installation at no charge.
- Identification: **#9350** provides an identification function by which a CPU under stored program control and operating on a switched public network, can identify a legitimate 3780. **Prerequisites:** **#7651**.
- Terminal Use (point-to-point): **#9711** for communications with another 3780 or 2780. Provides "Bell" key and light indicator to signal remote terminal that voice mode is desired. Receipt of "Bell" code sounds alarm. When communication is alternatively with a CPU and another 3780 or 2780, via switched network. **Field Installation:** Yes.
- 3704/3705 Medium Speed Local Attachment: Specify Modem or Data Set Attachment ... see below. Either **#2903** (2000 or 2400 bps) or **#2983** (1200 bps), only. Also Communications Facilities ... see below. **#9402** for half-duplex.
- Modem or Data Set Attachment: One of the following, depending upon facility to be used, must be specified:
#2903: For attachment to the 3977 mdl 2 for operation at 2000 or 2400 bps. **Prerequisites:** **#7705** and either **#2995** for 2000 bps or **#2996** for 2400 bps.
#2981: Switched Network Attachment. Required for operation on PTT switched facilities. **Note:** See **#7705** to determine if required. **Maximum:** One. The 3976 mdl 3 will operate on the switched network without **#2981**. **Prerequisites:** **#7651** ... not required for Manual Answer.
#2982: Required for the 3976 Modem mdl 3 on switched lines or PTT mandatory modems at 1200 bps on switched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin. Includes the function of **#2981**. **Prerequisites:** **#7705**.
#2983: Required for the 3976 Modem mdl 3 on nonswitched lines or PTT mandatory modems at 1200 bps on nonswitched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28

and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin. **Prerequisites:** **#7705**.

#9120: Required for PTT mandatory modems at 2400 bps on switched lines complying with CCITT Recommendations (1976) V.24, V.26bis, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

#9121: Required for IBM 2400 bps Integrated Modem or the 3872 modem or PTT mandatory modems at 2400 bps on nonswitched lines complying with CCITT Recommendations (1976) V.24, V.26, V.28 and ISO Standard 2110 (Japan only+ or 2400 bps on the NTT DDX Network +) (Canada only+ or Facility K3M +). Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

#9124: Provides 4800 bps. Required for the 3874 Modem or PTT mandatory modems at 4800 bps on nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.27 or V.27bis, and ISO Standard 2110 (Japan only+ or 4800 bps on the NTT DDX Network +) (Canada only+ or Facility K4M +). Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

#9126: For 3875 at 7200 bps with backup half-speed on leased facilities.

- Communications Facilities: Features specify 3780 control of the data set and do not necessarily correspond to the communications facility. **Field Installation:** Yes. Specify as indicated below:

#9402:

Switched Network Operation

Leased Private Line (or equivalent privately owned).

Multipoint ... (half-duplex), although the communications facility may be 2- or 4-wire.

Point-to-point ... for 2-wire (half-duplex) communications facilities.

If the 3780 Integrated Modem or the 3872, or 3875 Modem is used.

#9404:

For 4-wire (full-duplex) facilities.

- Extended Retry Transmission: **#9150** extends the maximum retry count from three (12 seconds) to a maximum of 15 (48 seconds) in an effort to recognize a valid response to the last block of data transmitted, prior to sending an EOT code and timing out with an error condition.
- Data Set Cable: A 20 foot data set cable is provided as standard. If a longer cable is required, specify **#9021**, indicating length as a quantity of 25, 30, 35 or 40 feet.
- WACK Response: **#9936** if initial WACK (Wait before transmit - positive ACKnowledge) is to be transmitted immediately. All subsequent WACK responses are transmitted after a 2-second delay.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- Language Groups:
English UK **#2927** German **#2929**
English US **#2750** Italian **#2932**
French **#2928** Japanese **#2930**

SPECIAL FEATURES

Component Selection (#1601): Provides the capability of specific 3780 I/O device selection. In addition to component selection, it provides priority output selection and Multipoint Data Link Control selection capability. It is a prerequisite for attachment of a 3781 Card Punch. **Field Installation:** Yes.

Direct Line Attachment (#2939): Provides modem/line isolation required by some PTTs. **Prerequisites:** **#5600** or **#5602**.

EBCDIC Transparency (#3601): Allows the 3780 to receive and transmit all 256 EBCDIC bit combinations as data characters. Variable length records cannot be transmitted if card I/O or printer is selected. Either normal or transparent text can be received without the "transparency" switch being in the transparency position. The switch must be "On" for transmitting in transparency. If a terminal on a

3780 Data Communications Terminal (cont'd)

multipoint line requires this feature, all terminals on that line must also have this feature. **Field Installation:** Yes. **Prerequisites:** #9761.

Keylock (#4650): A key-operated Power-On switch for the 3780. The key must be inserted and turned to the "On" position before the control unit Power-On switch is operative. When the key is turned off, power is removed from the control unit. For additional or replacement keys, see "Accessories". **Field Installation:** Yes.

Multipoint Data Link Control (#5010): Allows multiple 3780s to be used on the same communications line with a CPU. Terminal can be polled or selected when operating as a tributary station on a multipoint system. All 3780s installed on the same line facility require this feature and must use the same transmission code and data set attachment. Other BSC devices (2780, S/360, S/370, 4300 processors) as tributary stations, can be on a multipoint line with a processor control station. **Limitations:** If Terminal Use (#9711) is installed, it must be removed prior to installation of this feature. **Field Installation:** Yes.

Integrated 2400/1200 bps Modem (#5600, #5602,): Provides an integrated 2400 bps modem with half-speed backup capability. Equivalent to and compatible with similarly featured 3872 modems. Two versions cover different communications requirements, as described in the separate feature descriptions. Operator controls are integrated with the 3780 operator panel. Built-in diagnostic functions are provided for local and remote testing. See M2700, 3872 pages and "Prerequisites" above for additional information on allowable machine/system combinations and required features. **Maximum: One #5600 or #5602.**

Leased Line Point-to-Point Modem (#5600): Provides point-to-point terminal-terminal and terminal-CPU communications with a similarly equipped 3780 or a 2780, 3780, S/360, S/370 or 4300 Processors equipped with appropriate features and an equivalent featured 3872 modem. Includes manual equalization control. **Field Installation:** Yes. **Prerequisites:** #9121, #9402, #9711 may be required, depending upon application. **Specify:** (Japan only+ #2943 must be ordered for attachment to NTT D-1 service. +) #9021 plus length, if non-standard cable length is required.

Leased Line Multipoint Tributary Modem (#5602): Operates on a multipoint network with a controlling CPU. Other 3780s on the same line facility must have either #5602 or a 3872 modem with Multipoint Tributary (#5101 or #5102); other BSC tributary devices on the same line facility must have a 3872 modem with #5101 or #5102. Utilizes nonswitched telecommunication lines of a normal quality (see line specifications in *IBM 3872 Modem User's Guide* (GA27-3058). **Limitations:** #9711 cannot be installed. **Field Installation:** Yes. **Prerequisites:** #9121, #9402, #5010. **Specify:** (Japan only+ #2943 must be ordered for attachment to NTT D-1 service. +) #9021 plus length, if non-standard cable length is required.

Print Positions, Add'l (#5701): Provides an additional 24 print positions for the 3780 printer. **Field Installation:** Yes.

Switched Network Control (#7651): To attach to a switched network, provides automatic answering of incoming calls initiated by another terminal or central computer over common carrier switched (dial-up) facilities. The line must be equipped with an appropriate data set with auto answer capability and the terminal must be in "ready" status. Provides automatic disconnect when disconnect sequence is received or when no data is transmitted/received for 20 seconds. Disconnect causes audible alarm to sound. **Field Installation:** Yes.

Synchronous Clock (#7705): A synchronous clock for use with modems which do not have an internal clock, or for use with 3704/3705 Medium Speed Local Attachment Line Set, Type 1F. Will operate at 600 bps, 1200 bps, 2000 bps, or 2400 bps. The device with which the 3780 will communicate must also have an internal clock operating at the same bps rate. **Specify:** #2701 for 600 bps, #2702 for 1200 bps, #2703 for 2000 bps, #2704 for 2400 bps. If speed is 1200 bps, alternative speed of 600 bps will be provided via speed selector switch. **Field Installation:** Yes.

MODEL CONVERSIONS (None)
ACCESSORIES

Locks and Keys: The 3780 with Keylock (#4650) is shipped with two keys. Additional or replacement keys must be ordered only from IBM. A letter of authorization with key identification number (stamped on key) must accompany the order. **Note:** Without key identification number, a new Keylock (#4650) special feature must be ordered. Allow seven weeks for delivery.

SUPPLIES (None)

3800 PRINTING SUBSYSTEM MODEL 1

THERE IS MORE THAN 1 TEXT VERSION OF THIS PRODUCT

PURPOSE

The 3800 model 1 is the printer output unit for S/370 models 145, 145-3, 148, 155II, 158, 158 Submodel 2, 165II, 168, 3031, 3032, 3033, 3081, 3083, 3084 and 4300 Processor. A feature allows data input from magnetic tape without printer output unit attachment to a system.

MODEL 1

Model 1 001: (NO LONGER AVAILABLE)

Prerequisites: A control unit position on a system channel and/or Tape-to-Printing Subsystem Feature (#7810).

Processor Attachment:

- S/370 model 145 (excluding 3145-3) -- byte multiplexer channel (standard), selector channels (first one is standard), block multiplexer channels (special features); see M3145 pages. Attachment to the byte multiplexer channel is not recommended. Selector channel attachment is not recommended unless dedicated.
- S/370 model 145-3, 148 -- byte multiplexer channel (standard), block multiplexer channels; see M3145-3, 3148 pages. Attachment to the byte multiplexer channel is not recommended.
- S/370 model 155II, 158 -- byte multiplexer channel (standard), 2nd byte multiplexer channel (special feature), block multiplexer channels (first two are standard); see M3155, 3158, 3158-3 pages.
- S/370 model 165II, 168 -- Selector channel of 2860, basic multiplexer channel of 2870, selector subchannel (special feature) of 2870, shared or non-shared subchannel of 2880; see M2860, 2870, 2880 pages. Selector channel attachment is not recommended unless dedicated.
- 3031 or 3032 Processor -- byte multiplexer channel (one is standard), block multiplexer channels (five are standard); see M3031, 3032 pages. 3033 Processor -- byte multiplexer channels (two are standard), block multiplexer channels (ten are standard); see M3033 pages.
- 3081, 3083, 3084 Processor -- byte multiplexer channels, block multiplexer channels; see M3081, 3083, 3084 pages. Attachment to a byte multiplexer mode channel is not recommended.
- 4300 Processor -- byte multiplexer channel, block multiplexer channel. Attachment to the byte multiplexer is not recommended.
- 3090 Processor -- byte multiplexer channels; see M3090 pages. Attachment to a byte multiplexer mode channel is not recommended.
- Tape-to-Printing Subsystem (#7810) -- in lieu of or in addition to system channel attachments above; see "Special Features".

Limitations: Prints on discrete form sizes in either of two standards. Common Use Standard utilizes five forms depths (3-1/2, 5-1/2, 7, 8-1/2 and 11 inches) and ten forms widths (measured edge to edge: 6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3 and, 14-7/8 inches) which permute to 50 discrete sizes. Common Use Option Forms are refolded into lengths of 7 (2 x 3-1/2), 8-1/2, and 11 inches (2 x 5-1/2).

The ISO Standard utilizes six forms depths (3- (78.2mm), 4- (101.6mm), 6- (152.4mm), 8- (203.2mm), 10- (254.0mm) and 12-inch

depths (304.8mm)) and 13 forms widths (measured edge to edge: 165mm, 180mm, 215mm, 235mm, 250mm, 270mm, 280mm, 305mm, 322mm, 340mm, 363mm, 375mm, 378mm) which permute into 78 discrete sizes. ISO Option forms are refolded into 6-, 8-, 10-, and 12-inch lengths.

Character and forms overlay printing are restricted from the first and last half inches of forms lengths. A printed line can begin a minimum of 0.5 inches from the left page edge and must end no nearer than 0.8 inches from the right-side edge of the paper for all widths except the 14-7/8 inch width for which the printed lines must end at least 0.675 inches from the right.

Paper must be from 15 lb (56.4 g/m(2)) to 24 lb (90.2 g/m(2)) basic weight except for OCR for which the minimum paper weight is 20 lb (75.3 g/m(2)). See GA26-1633-0 for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, and print line adjustment is made by electronically moving the line. First print positions can move to the right 5.7 inches but will cause an equivalent number of positions at the right end to be moved beyond the above-defined print line boundaries.

It is recommended that printing not occur within 0.100 inches of any binder holes or corner cuts within the form.

HIGHLIGHTS

Prints on single-part continuous forms equipped for either of two paper size standards: The Common Use Option, which supports 50 discrete paper sizes, or the ISO option, which supports 78 discrete paper sizes. Printing is repeated for multiple copies, and every copy is of "original" quality.

Print Speed Range: Common Use Option

Forms Length Inches	Forms Per Min. Up to:	Lines Per Minute*		
		6 lpi Up to:	8 lpi Up to:	12 lpi Up to:
3-1/2	526	7,890	10,520	15,780

12	143	9,438	12,584	18,876

* Single Copy Speeds

Printer job throughput can vary depending upon form length, number of copies needed, and functions exercised.

52K-byte storage is standard for page buffering. Storage is reduced to 42K when data input is from magnetic tape in lieu of system.

Pitches: 10, 12 and 15 characters per inch (cpi) are standard.

Print Line Maximums: Of 136 positions at 10 cpi, 163 positions at 12 cpi, 204 positions at 15 cpi; pitches (10, 12 and 15 cpi) can be intermixed within a page or line; vertical line spacings are 6, 8, and 12 lines per inch, with intermixed line spacing within a page being possible.

Standard Character Sets

Character Style	Pitch (dpi)			Special Under-scored
	10	12	15	
Gothic	X	X	X	Yes
Gothic 15 Condensed			X	Yes
Text 1 (Uppercase)	X			Yes
Text 2 (Lowercase)	X			Yes
OCR A	X			
Format	X	X	X	
Katakana	X	X		

Note: Includes all standard World Trade National Use Graphics.

Character sets are organized into blocks of up to 64 characters and are held in subsystem read-only storage.

The 3800 Printing Subsystem has electronic character generation using Writeable Character Generation Storage -- 128 Writeable Character Generation Storage positions are standard and organized into two 64-character Writeable Character Generation Modules (WCGM); character sets are program-selected without operator intervention and dynamically loaded into hardware WCGMs - when operating under control of feature #7810, character sets containing national use graphics are loaded from the 3800 control file tape if any one of the following is used:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility program product (5748-UT2) or, if one of these program products is not used, from separate tape available as a specify feature (see "Specify" under #7810).

An additional increment of 127 Writeable Character Generation Storage positions (optional) provides dynamic storage for printing four character styles and/or pitches with one data set -- this represents up to 255 graphics online with no throughput loss; dynamic storage allows character substitution under program control; a customer may design his/her own characters. When operating under control of #7810, customer-designed characters require use of any one of the following:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility program product (5748-UT2).

Character substitution involving national use graphics only can be accomplished without any one of the following:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility program product (5748-UT2) by means of separate tape available as a specify feature (see "Specify" under #7810).

By using the Gothic 15 style font (15 characters/inch at 8 lines/inch), reports can be reduced from 11 x 14-7/8 inches to the more convenient size of 8-1/2 x 11 inches thereby increasing throughput while reducing both forms costs and filing space requirements. The application of 12 lpi vertical spacing with the Gothic 15 Condensed character set can result in a further reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.

Optical Character Recognition (OCR): Printing alphanumeric OCR A and the less stylized OCR B fonts can be intermixed with non-OCR fonts with no reduction in printing throughput. Documents may be processed by the 1287, 1288 and 3886 Optical Character Readers. Refer to the appropriate sales manual pages for specific capabilities.

Optical Character Recognition (OCR printing in OCR-A font and OCR-B font) in numeric representation plus three special characters or symbols can be done only on codelines 18, 34, and 108 of turnaround documents (1/3 in., 2/3 in., and 2-1/4 in. from bottom of document) and may require some of the following RPQs YB0029, XA9753, XA9754. These documents can be read on the 1270, 1275 Optical Reader Sorters (cannot read codeline 34), and the 3890 model C or D Document Processor. The special characters are the (hook), (chair), and (fork) of the OCR-A font and the special symbols of plus sign, less than sign, and greater than sign of the OCR-B font. The technology used by electro-photographic printers is radically different than that of impact printers. Toner is deposited on paper and fused to it with heat. Several passes of paper printed in this fashion through a reader/sorter may cause higher reject rates than the user currently experiences. Therefore, to assure satisfactory performance in reading OCR documents printed on electro-photographic printers, and to achieve low reject rate, it is necessary that IBM personnel refer to the "OCR Marketing Guide for 3800/1270, 1275 and 3890". For further information refer to the reader sorter manuals, "Reference Manual for IBM 3800 Printing Subsystem - OCR Document Preparation", GA26-1646, and the "OCR Print Quality Guide".

Note: The OCR characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the "United States of America Standard Character Set for Optical Character Recognition, size A, USAS X3.17-1966" for OCR-A font (also referred to as ANSCS OCR) and the "European Computer Manufacturers Association's Standard ECMA-11 for Alphanumeric Character Set OCR-B for Optical Recognition 2nd Edition, October 1971" for OCR-B font.

Text Character Set: Uses upper- and lowercase characters, serif design, special graphics, with no reduction in throughput.

Format: Is in 10, 12 and 15 pitch, with merge format and data, and is program-controlled. Format 10, 12, and 15 pitch - merge format and data - program controlled for online operation, for offline with feature #7810 format character sets requires any one of the following:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility Program Product (5748-UT2).

Copy Modification Function: Identifies copies with legends, phrases or names (e.g., "Customer Copy", "For Accounting Use Only", etc.), addresses each report copy to speed distribution, spots carbon or field blackout functions, is identification and deletion program controlled; has customized forms with the identification, deletion and formatting functions. When operating under control of #7810, Copy Modification Function requires any one of the following:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility Program Product (5748-UT2).

Forms Overlay: Optical image system prints high-quality document and report formats, designs or other constant data, merge format and data, and is program controlled. When operating under control of #7810, overlay is invoked from the operators panel or by any one of the following:

1. MVS/370 Data Facility Product (5665-295);
2. MVS/XA Data Facility Product (5665-284); or
3. Offline IBM 3800 Utility program product (5748-UT2).

Single Part Continuous Form Output: Includes custom print forms, and features no deleaving, no carbon disposal, faster turnaround, program control of copy quantity, with up to 255 copies. Job separation is by perforation marking use Mark Form function.

Optional Burster-Trimmed-Stacker Output: Burster/trimmer bottle-necks eliminated; offset separation between data set copies; re-

moval of output while running; first-in, first-out job sequence; trimmed edges.

Optional Channel Switching: Manual switches provide system configuration flexibility through the use of the 2914 Manual Switch model 1 (RPQ 880882) or the Two Channel Switch feature (#8170); automatic switching is provided by the Dynamic Two-Channel Switch feature (#8171) for two processors in a tightly coupled MP configuration, and two channels on a single processor providing alternate path capability.

Laser Safety: The 3800 contains a laser assembly. In IBM's opinion, the 3800, including the laser assembly, is designed to comply with the safety standards of the U.S. Department of Health, Education and Welfare (21 CFR 1040). Separate registrations by the customer may be required by some states. A number of countries presently have, and others are considering, the adoption of regulations governing the use of laser products. The customer is responsible for determining the extent of regulations governing the use of laser products at their location.

SPECIFY

● Power (AC, 3-phase):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	

● Color (for end cover only; machine is cloud white): Specify #9041 for red, #9042 for yellow, #9043 for blue, or #9045 for gray.

● Machine Nomenclature:

English #2927	Italian #2932
French #2928	Spanish #2931
German #2929	

● Paper Sizes:

#2741 - Common Use
#2742 - ISO

Common Use Paper Sizes (#2741): Enables the 3800 to process the following forms depths and widths:

- Five Forms Depths (in inches):
3-1/2, 5-1/2, 7, 8-1/2, 11
- Ten Forms Widths (in inches, edge to edge):
6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3, 14-7/8

Limitations: Cannot be installed with ISO Paper Sizes #2742. Maximum: One. Field Installation: Yes.

ISO Paper Sizes (#2742): Enables the 3800 to process the following forms depths and widths:

- Six Forms Depths
(in inches): 3, 4, 6, 8, 10, 12
(in mm): 76.2, 101.6, 152.4, 203.2, 254.0, 304.8
- 13 Forms Widths (in mm, edge to edge):
165, 180, 215, 235, 250, 270, 280, 305, 322, 340, 363, 375, 378

Limitations: Cannot be installed with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: Yes.

● Tool Kit:

For rental customer, select one:

- First 3800 (model 1 or 3) ordered, specify #9330 when ordering a model 1.
- If unit ordered is second or higher 3800 model 1 or 3 to be installed, no additional tool kit is required.
- If required for a multiple machine installation because of physical locations of machines, an additional tool kit(s) is available on a no-charge MES. (See M3800-3 pages if a model is at the alternate location.)

For purchase customer, select one:

- For each new purchase 3800 model 1, specify #9330.
- When installed 3800 model 1s are purchased, a tool kit (#9330) is to be ordered on a no-charge MES for each machine.

Note: A Tool Kit (#9220) is required with Burster-Trimmer-Stacker (#1490); see #1490 below.

SPECIAL FEATURES

Burster-Trimmer-Stacker (#1490): (NO LONGER AVAILABLE) Provides an additional output stacking mode. Bursts the five Common Use forms lengths or the six ISO lengths to individual sheets and stacks sheets sequentially. It also trims the left and right 12.7mm (0.5 inch) carrier strips from output sheet. Maximum: One. Field Installation: Yes. Specify: One tool kit.

For rental customer -- specify #9220 for first Burster-Trimmer-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

For purchase -- specify #9220 on each Burster-Trimmer-Stacker feature order. When installed Burster-Trimmer-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

127 Writeable Character Generation Storage Positions, Add'l (#5401): (NO LONGER AVAILABLE) Additional increment of 127 positions allows up to 255 graphics to be printed within a data set. Maximum: One. Field Installation: Yes.

Remote Switch Attachment (#6148): (NO LONGER AVAILABLE) To attach the Two-Channel Switch (#8170) to a configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8170.

Tape-To-Printing Subsystem Feature (#7810): (NO LONGER AVAILABLE) Allows the 3800 to be operated from magnetic tape data. Either 3411/3410 or 3803/3420 tape systems may be attached. With the feature installed, the 3800 may be operated either offline under operator control or online. Up to eight tape control units may be attached provided that power sequencing and control connection for all other than one are provided by a system; and provided that all 3803 control units have at least one path, which may be switchable, to a S/360, S/370 or 4300 processor. This feature will accept the non-IBM system print tape formats described below.

Burroughs: B7000/B6000 Print Backup Tapes. For further detail, refer the customer to:

"B7000/B6000 Series System Software Operational Guide" Volume 1 (form #5001563), Section 1 (Backup)

Tape files must be 7- or 9-track, EBCDIC coding, and ANSI (USAS) standard tape labels and data formats. For further detail, refer the customer to:

"B7000/B6000 Series I/O System Reference Manual" (form #5001779).

For definition of line printer control words, refer the customer to: "Burroughs B6700 Handbook" (form #5000276).

MACHINES

Honeywell: Series 60 (level 66/6000) Bulk Media Conversion program formats and Standard System formats that have the following characteristics:

- Variable-length records
- Binary or BCD mode
- 7- or 9-track
- Standard labeled or non-labeled
- Low- or high-density
- Standard printer commands with or without edit characters

For further details, refer the customer to the following Honeywell publications:

"DD11 Bulk Media Conversion"
"DD07 File and Record Control"
"DB82A I/O Programming"

Sperry Univac: 1100 series systems System Data Format (SDF) Symbiont print tape. For further detail refer the customer to:

"Sperry Univac 1100 Series Executive System Volume 3 System Processors" (form #4144.3).

Tape files may be 7- or 9-track, Field Data or ASCII

For further description of tape labels and file format and definition of line printer control functions refer the customer to:

"Sperry Univac 1100 Series Executive System Volume 2 EXEC" (form #4144.2).

Limitations: Selection of the non-IBM system tape format to be used must be made by the operator before printing.

Where more than one print character is represented by one 8-bit byte (data packing) on the non-IBM system print tape, applications using character densities above 8,160 characters per 11-inch page may impact 3800 overall throughput and must be evaluated.

When using non-IBM system print tape formats, control tapes produced by any one of the following: 1) MVS/370 Data Facility Product (5665-295); 2) MVS/XA Data Facility Product (5665-284); or 3) Offline IBM 3800 Utility program product (5748-UT2) are supported only with an IBM record format of VBM (variable-length-block machine language) with standard IBM labels or no labels.

Maximum: One. Field Installation: Yes. Specify: EBCDIC and Japanese Katakana character arrangements are standard with #7810. A full set of national use graphics is included in any one of the following: 1) MVS/370 Data Facility Product (5665-295); 2) MVS/XA Data Facility Product (5665-284); or 3) Offline IBM 3800 Utility program product (5748-UT2). When any one of these program products is not to be installed or to be installed, specify one of the

following for the standard WT national use graphic arrangements, if required:

Brazil	#2975	Italy	#2968
Canada (French)	#2977	Japan	#2955
France	#2970	Portugal	#2959
Germany	#2957	Spain	#2960
International	#2950		
Spanish Speaking	#2969		

Prerequisites to specify features for #7810: The specify features for national use graphic arrangements are supplied on magnetic tape and shipped with #7810. For tape density and format required, specify one:

#2704 9-track 1600 bpi
#2705 9-track 6250 bpi

Channel Attachment Features, or Tape-to-Printing Subsystem feature #7810 in lieu of or in addition to channel attachment.

Two-Channel Switch (#8170): (NO LONGER AVAILABLE) To attach the 3800 to two S/370 or 4300 processor channels which may be on the same processor or on two different processors (both interfaces must have the same device address). The Two-Channel Switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. Maximum: One. Field Installation: Yes.

Dynamic Two-Channel Switch (#8171): (NO LONGER AVAILABLE) Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems, and to be attached to two channels from a single processor in order to provide alternate path capability. For either tightly coupled multiprocessor or single processor attachments, data transfer occurs on only one channel path at a time. Maximum: One. Field Installation: Yes. Prerequisites: #8170.

MODEL CONVERSIONS

A purchased 3800 model 1 can be field converted to a 3800 model 3 by MES; see text for 3800 Model 3.

ACCESSORIES (NONE)

SUPPLIES

Contact your Country DP Supplies Coordinator.

3800 PRINTING SUBSYSTEM MODEL 2

PURPOSE

The 3800 model 2 allows the printing of an additional 8,192 Extended Graphics characters* in addition to the functions and features already available on the 3800 Printing Subsystem except for the Tape-to-Printing Subsystem Feature (#7810). Installed 3800 model 1s can be field converted to the 3800 model 2.

Reference: The 3800 Printing Subsystem model 1 "Purpose", "Highlights", "Limitations" and "Prerequisites" apply to the model 2 also.

MODEL 2

Model 2 002: (NO LONGER AVAILABLE)

Restrictions: The Tape-to-Printing Subsystems Feature (#7810) cannot be concurrently installed with the 3800 model 2. Installed 3800 model 1s which have #7810, must have it removed if conversion to the 3800 model 2 is desired. All other features of the 3800 model 1 may be installed.

Prerequisites: The 3800 Enhancements for MVS and VS1 must be installed as a prerequisite (see DP Programming Announcement Letters ZP79-0265 and ZP79-0266 for MVS, and ZP79-0329 for VS1). In addition, the 3800 model 1 prerequisites also apply to the model 2.

HIGHLIGHTS

- **Hardware**

The Extended Graphics capability is designed to provide an additional character set for the 3800 Printing Subsystem. The 3800 model 2 supports 191 single-byte characters plus a special font containing up to an additional 8,192 two-byte characters* at speeds up to 10,020 lines per minute. This capability which is available with the model 2 includes the Japanese ideographic characters, Katakana and Hiragana characters, the Korean Hangeul, the English, Russian, and Greek alphabets; Arabic and Roman numerals; and special symbols.

The Extended Graphics capability may be intermixed with other character sets (single-byte) available with the 3800 model 1. The raster patterns of the Extended Graphics character set are loaded under program control. A 3800 model 2 with this capability may process jobs not containing Extended Graphics data without affecting standard 3800 model 1 functions.

The Extended Graphics characters are formed by combining two standard 3800 print cells, which create 6 and 7.5 horizontal graphic characters per inch. Before Extended Graphics characters can be printed they are loaded from the host processor into an Extended Graphics storage buffer (available only with the model 2). Once loaded, the Extended Graphics storage is preserved until the 3800 model 2 microcode is subsequently reloaded or 3800 power is removed. When this capability is enabled (under program control) and in use, it does not allow the use of WCGM 1. However, any character set stored in WCGM 1 when Extended Graphics mode was enabled is left unchanged and may be used when this capability is subsequently disabled and not in use. Also, the microcode requires an additional 4K bytes of the standard 3800 page buffer, leaving 48K. Two-byte characters cannot be underscored utilizing the hardware function. If the user wishes to underscore certain two-byte characters, the corresponding raster pattern must be designed including the underscore. Single-byte characters may still use the hardware underscore function.

The Extended Graphics character set for Kanji and Chinese consists of 7,190 characters including one blank at 7.5 characters per inch (pitch), 1 special blank character, and 410 characters including one blank at 6 characters per inch (pitch). Also, in addition to the IBM-supplied characters, the user may define 309 characters at 7.5-pitch and 282 characters at 6-pitch. The 6-pitch and 7.5-pitch characters that represent the same graphic symbol are addressed by unique code points.

The Extended Graphic Character set for Korean Hangeul consists of 3,700 Hangeul characters, 96 EBCDIC Characters including 2 blank characters at 7.5 characters per inch (pitch), and 410 characters including 1 blank character at 6 characters per inch (pitch). In addition to the IBM-supplied characters, the user may define 374 characters at 7.5-pitch and/or at 6-pitch. A maximum of 4,580 characters are supported.

These Extended Graphics characters of 6- and 7.5-pitch may be intermixed on a line and printed at either 4 or 6 lines per inch. The 3800 model 2 will have the same throughput performance as a 3800 model 1 except for those jobs affected by the reduced page buffer size.

* Includes 3 blank characters.

- **DPIP/CESA**

The 3800 model 2 requires DPIP/CESA review at proposal and order entry and credit times. For countries other than Japan, the first three proposals must be reviewed by IBM Japan DPIP/CESA function.

- **Programming**

The Extended Graphics capability is supported by the OS/VS2 MVS Release 3.8 and OS/VS1 Release 7.0 operating systems.

The Extended Graphics Programming Support will provide for the:

- Recognition of Extended Graphics font through existing JCL or SETPR parameters.
- Creation of Extended Graphics font table using IBM assembler language.
- Processing of Extended Graphics font.
- Creation of user-designed Extended Graphics characters through existing function of the 3800 IEBIMAGE utility.
- Loading of Extended Graphics characters into the 3800 Extended Graphics storage.
- Processing of data in either Extended Graphics mode or standard (single-byte) mode.

Publications: The following publications are for the model 2 and are in addition to those already available with the 3800 model 1:

- N: GA18-2054 (Japanese), GA18-2054 (English), IBM 3800 Printing Subsystem Extended Graphics
- SY18-2035 (English), IBM 3800 Printing Subsystem Extended Graphics Programming Logic
- N: GX18-2035 (Japanese), GX18-2035 (English), IBM 3800 Printing Subsystem Character Design and Coding Form for Extended Graphics
- N: GC18-0611 (Japanese), IBM Japanese Graphic Character Set Reference Manual
- N: GC18-0612 (Japanese), IBM Japanese Graphic Character Set KANJI Number Dictionary
- N: GC18-0613 (Japanese), IBM Japanese Graphic Character Set Keyboard Operator's Handbook
- N: GA18-1071 (Japanese), Character Design Guide for IBM 3800 model 2

MACHINES

SPECIFY

The following specify codes apply only to the 3800 model 2. These specify codes are in addition to those listed for the 3800 model 1 which should also be used when ordering a new 3800 model 2 from the factory.

- Extended Graphics Hardware (Mandatory for 3800 model 2): #7S0278.
- For the Extended Graphics programs, the following codes should be used on the program ordering sheet:
 - Extended Graphics Device Support
 - #5799-WRM for OS/VS2 MVS
 - #5799-WRN for OS/VS1
 - Extended Graphics Device Support supplied on magnetic tape: #9029 9-track 1600 bpi -- #9031 9-track 6250 bpi.
 - Microfiche for Program Listings (Optional): #7050 -- Form #SYA8-2037 for OS/VS2 MVS -- Form #SYA8-2038 for OS/VS1.

SPECIAL FEATURES

Burster-Trimmed-Stacker (#1490): (NO LONGER AVAILABLE) Provides an additional output stacking mode. Burst the five Common Use forms lengths or the six ISO lengths to individual sheets and stacks sheets sequentially. It also trims the left and right 0.5 inch (12.7mm) carrier strips from output sheet. Maximum: One. Field Installation: Yes. Specify: (1) tool kit #9220 required for CE maintenance. Contact the account Field Manager for requirements.

- For rental customer -- specify #9220 for first Burster-Trimmed-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.
- For purchase -- specify #9220 on each Burster-Trimmed-Stacker feature order. When installed Burster-Trimmed-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

127 Writable Character Generation Storage Positions, Add'l (#5401): (NO LONGER AVAILABLE) Additional increment of 127 positions allows up to 255 graphics to be printed within a data set. Maximum: One. Field Installation: Yes.

Channel Attachment Features: (NO LONGER AVAILABLE) For Tape-to-Printing Subsystem Feature #7810 in lieu of or in addition to channel attachment.

Remote Switch Attachment (#8148): (NO LONGER AVAILABLE) To attach the Two-Channel Switch (#8170) to a configuration control panel. Maximum: One. Field Installation: Yes.

Two-Channel Switch (#8170): (NO LONGER AVAILABLE) To attach the 3800 to two S/370 or 4300 Processor channels which may be on the same processor or on two different processors (both interfaces must have the same device address). The Two-Channel Switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel.

Dynamic Two-Channel Switch (#8171): (NO LONGER AVAILABLE) Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems, and to be attached to two channels from a single processor in order to provide alternate path capability. For either tightly coupled multiprocessor or single processor attachments, data transfer occurs on only one channel path at a time. Prerequisites: #8170. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS

Model 1 to model 2 is field installable.

ACCESSORIES (NONE)

SUPPLIES

Contact your Country DP Supplies Coordinator.

3800 PRINTING SUBSYSTEM MODEL 3

PURPOSE

Printer output unit for S/370 models 158, 168, and the 3031, 3032, 3033, 3081, 3083, 3084, 3090, 4341, 4361 Model Group 5 and 4381 Processors.

Note: Operating System support for the model 3 is provided under MVS/370 and MVS/XA. For details refer to 3800 Printing Subsystem Model 3 announcement letter 182-095, dated November 1, 1982 and to New Support for IBM 3800 Printing Subsystem Model 3 announcement letters 284-036, 037, 038 and 039 dated February 7, 1984. Prerequisite programming requirements are contained in announcement letters 184-025; 284-074, 075, 077, 078, 079 and 081.

MODEL 3

Model 3 003

Prerequisites: A control unit position on a system channel is required.

Note: The model 3 does not provide for attachment to a byte multiplexer channel.

Processor Attachment:

- S/370 model 158: Block multiplexer channels (first two are standard). The model 158-1 requires EC 278240 to operate with the 3800 model 3. The model 158-3 requires EC 278249 to operate with the 3800 model 3. See M3158-1, 3158-3 pages.
- S/370 model 168: Selector channel of 2860, selector subchannel (special feature) of 2870, shared or non-shared subchannel of 2880; see M2860, 2870, 2880 pages. Selector channel attachment is not recommended unless dedicated to the printer; see M3168 pages.
- 3031 or 3032 Processor: Block multiplexer channels (five are standard); the 3031 and 3032 require EC 279679 to operate with the 3800 model 3. See M3031 and 3032 pages.
- 3033 Processor: On models U, A, and M block multiplexer channels (ten are standard); on Model Group N block multiplexer channels (five are standard, five are optional); on Model Group S block multiplexer channel (five are standard); the 3033 requires EC 279679 to operate with the 3800 model 3. See M3033 pages.
- 3081 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed) -- the 3081 requires system EC 213971 (including microcode EC 214788) to operate with the 3800 model 3; see M3081 pages.
- 3083 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed); see M3083 pages.
- 3084 Processor: Block multiplexer channels (up to 24 possible per side, 20 if 4 byte multiplexer channels are installed); see M3084 pages.
- 3090 model 200 Processor: Block multiplexer channels (up to 48 possible, 44 if 4 byte multiplexer channels are installed; see M3090 model 200 pages.
- 3090 model 400 Processor: Block multiplexer channels (up to 48 per side, 44 if 4 byte multiplexer channels are installed; see M3090 model 400 pages.
- 4300 Processor: Block multiplexer channel; see M4341, 4361, 4381 pages.
- 9370 Processor: Block multiplexer channel; see M9373, 9375, 9377 pages.

HIGHLIGHTS

The 3800 model 3 offers new printing functions and improved print density with 240x240 picture elements (pels) per square inch, a 2.2 times improvement over the 3800 model 1. There are two modes of operation - Compatibility mode which prints 3800 model 1 applications with a minimum of change to the application - and "all-points-addressable" mode which prints complex pages for image, text, graphics, and system printing applications. All-points-addressable mode is also called Page mode.

The model 3 prints on single part continuous forms and is equipped for either of two paper size standards: The Common Use Option which supports 50 discrete paper sizes or the ISO Option which supports 78 discrete paper sizes. Printing is repeated for multiple copies and every copy is "original" quality.

Printing throughput can vary depending on form length, number of copies needed, and functions exercised. Throughput of up to 20,040 lines per minute can be achieved -- see accompanying table.

Print Speed Range: The following speeds apply to the 3800 model 3 in Compatibility mode. The number of characters per line depends upon the form width being used. The speeds shown for 12 lpi are applicable when a maximum of 190 characters, including blanks, are printed on each line.

Common Use Option

Forms		Lines Per Minute *				
Lngth (in.)	Per Min.	6 lpi	8 lpi	10 lpi	12 lpi	
	Up to:	Up to:	Up to:	Up to:	Up to:	
3-1/2	526	7,890	10,520	13,150	15,780	
5-1/2	334	9,018	12,024	15,030	18,036	
7	263	9,468	12,624	15,780	18,936	
8-1/2	215	9,675	12,900	16,125	19,350	
11	167	10,020	13,360	16,700	20,040	

ISO Option

Forms		Lines Per Minute *				
Lngth (in.)	Per Min.	6 lpi	8 lpi	10 lpi	12 lpi	
	Up to:	Up to:	Up to:	Up to:	Up to:	
3	597	7,164	9,552	11,940	14,328	
4	454	8,172	10,896	13,620	16,344	
6	286	8,580	11,440	14,300	17,160	
8	215	9,030	12,040	15,050	18,060	
10	167	9,018	12,024	15,030	18,036	
12	143	9,438	12,584	15,730	18,876	

* Single copy speeds

Compatibility Mode: When operating in Compatibility mode the model 3 can perform the functions of the 3800 model 1, plus print at 10 lines per inch. This provides for easy migration of 3800 model 1 applications.

Note: The model 3 does not have a Tape-to-Printing Subsystem feature which is available for the 3800 model 1.

In Compatibility Mode the 3800 model 1 electronic character generation is emulated, providing 255 WCGM storage positions, organized in four 64-character Writeable Character Generation Modules (WCGM). Character sets are program selected without operator

intervention and dynamically loaded into hardware WCGMs. Dynamic storage allows character substitution under program control. Customers may design their own characters. The following standard 3800 model 1 character sets are provided with Data Facility Device Support Release 1.6 for 240x240 pel printing:

Character Sets Standard:

Character Style	Pitch (cpi)			Special Underscored
	10	12	15	
Gothic	X	X	X	Yes
Gothic 15 Condensed	X			Yes
Text 1 (Upper Case)	X			Yes
Text 2 (Lower Case)	X			Yes
OCR A	X			
OCR B	X			
Format	X	X	X	
Katakana	X	X	X	

Note: Includes World Trade National Use Graphics.

The 16 fonts provided with Document Composition Facility (5748-XX9), Release 2, are also provided in 240x240 pel form. Twenty-three fonts from the 6670 have been prepared for use with the 3800 model 3 in Compatibility mode. These characters were originally designed for 240x240 pel printing.

Customers can convert existing customer-created 3800 model 1 character sets or create new characters in the 240x240 pel density -- see Character Conversion Aid announcement letter.

All-Points-Addressable Mode: This mode is supported by Print Services Facility (5665-275), Print Management Facility (5665-307) and Overlay Generation Language (5665-308). Also, see Document Composition Facility (5748-XX9) and Graphical Data Display Manager (5748-XXH). Compatibility mode is also supported by MVS/370 Data Facility Product Release 1.1 (5665-295), MVS/XA Data Facility Product Version 1 Release 1.2 (5665-284), or MVS/XA Data Facility Product Version 2 Release 1.0 (5665-XA2).

New Printer Commands: Characters can be positioned at any defined point on the printable area of the page. Alphameric text can be generated in three orientations (one horizontal and two vertical). Proportional-spaced and fixed-space fonts ranging in size from 4 to 36 "points" can be printed. (A "point" is 1/72 inch and is a measure of character size. This should not be confused with a printable raster point, also called a pel.)

With the base machine multiple fonts can be mixed within one data set. The number of fonts which can be present in the base machine depends upon the character size and the number of characters in the font. Fonts can be loaded from the host into the printer and stored on the internal diskette (with user provided programming) or in raster pattern storage.

Solid and dashed lines can be generated horizontally and vertically from any defined point in the printable area of the page for any specified length as long as the line remains within the printable area of the page.

Raster images of logos, signatures, drawings and photographs up to full-page size can be printed. The images are printed in raster form of 240x240 dots per square inch. Images in raster form of 120x120 dots per square inch are accepted. For these the printer generates four dots for each one indicated, producing a facsimile the same size as the original. The Accumulator feature (#1010) is required for images larger than those which can be held in the raster pattern storage where the image size depends on the raster pattern storage installed and the amount required for fonts. (Images cannot be printed in compatibility mode.)

Quality considerations in the printing of images are similar to those for printing a forms overlay, e.g., line widths and large dark areas. These guidelines and restrictions are presented in the "Forms De-

sign Reference Guide for the IBM 3800 Printing Subsystem", GA26-1633.

A major extension has been made to provide "electronic overlay generation". The new capabilities allow a form to be printed from a sequence of printer commands which print lines (creating boxes), constant alphameric text, shaded areas, and images for signatures, logos, etc. This information (the electronic overlay) is merged by the printer with the variable data for a given page and printed. This capability will allow many custom forms of different sizes to be printed on blank paper.

Multiple electronic overlays can be held in the base printer and used on demand within one application. The maximum addressable number is 127. The maximum for an application will depend on the complexity of the electronic overlay and the demands made by the application on the control storage. Up to eight electronic overlays can be merged onto a single page. (Dependent upon the complexity, throughput may be impacted.)

Storage: A control storage of 512K bytes is provided in the base printer. This provides storage for the microcode, page buffers, tables associated with character fonts, etc.; a raster pattern storage with 256K bytes is provided in the base machine for multiple character sets and for limited storage of image data. Up to 512K bytes total is available by an incremental feature of 256K bytes. Fonts are stored in raster pattern storage and the amount of storage required is a function of the character size and the number of characters in the font. A font can have a maximum of 256 characters. An Accumulator feature (#1010) may be added. It allows more complex pages to be created for printing. The first increment is 768K bytes with expansion to a total of either 1,024K bytes or 1,280K bytes.

ADDITIONAL HIGHLIGHTS

Note: Some of the following highlights apply to the model 3 only when operating in compatibility mode and are so indicated.

● Gothic 15

(15 characters/inch at 8 or 10 lines/inch) - 11 in. x 14-7/8 in. reports can be reduced to 8-1/2 in. x 11 in.; convenient size; increased throughput, reduced forms cost, reduced filing space by using the maximum print span of 204 positions. The application of 12 lpi vertical spacing with the Gothic 15 Condensed character set can result in a reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.

● Optical Character Recognition (OCR) Printing

Alphameric OCR A and the less stylized OCR B fonts can be intermixed with non-OCR fonts with no reduction in printing throughput. Documents may be processed by the 1287, 1288, and 3886 Optical Character Readers. Refer to the appropriate pages for specific capabilities.

Note: The OCR-A characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the United States of America Standard Character Set for Optical Character Recognition, Size A, USAS X3.17-1977. The OCR-B characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the United States of America Standard Character Set for Optical Character Recognition, Size B, USAS X3.17-1975 and the European Computer Manufacturers Association's Standard ECMA-11 for Alphameric Character Set OCR-B for Optical Recognition, (EMCA 11-1975).

● Text Character Set

Upper and lower case characters with serifs; special graphics; no reduction in throughput. Note: The model 3 has extensive text capabilities in the all-points-addressable mode plus the availability of some 6670 fonts which can be used in compatibility mode.

- **Format 10, 12 and 15 Pitch**
Merge format and data; program controlled for online operation (compatibility mode only).
- **Copy Modification Function (Compatibility mode only)**
Identify copies with legends, phrases, or names (e.g., Customer Copy, For Accounting Purposes Only, etc.); address each report copy to speed distribution; spot carbon or field blackout functions; identification and deletion program controlled. Provides customized forms with the identification, deletion and formatting functions.
- **Forms Overlay (both modes)**
Optical image system; prints high quality document and report formats, designs or other constant data; merge format and data; program controlled.
- **Single Part Continuous Form Output**
Including custom printed forms; no delevaing; no carbon disposal; faster job separation making use of the Mark Form function.
- **Optional Burster-Trimmed-Stacker Output**
Eliminates bursting and delevaing bottlenecks; offset separation between data set copies; remove output while printing; first-in, first-out job sequence; trimmed edges.
- **Optional Channel Switching**
Manual switches provide system configuration flexibility through the use of the 3814 Switching Management System, or the 2914 Manual Switch model 1 (RPQ 880882), or the Two-Channel Switch (#8180); automatic switching is provided by the Dynamic Two-Channel Switch (#8181) for two processors in a tightly coupled multiprocessing configuration, and two channels on a single CPU providing alternate path capability.
- **Laser Safety**
The 3800 contains a laser assembly. In IBM's opinion, the 3800, including the laser assembly, is designed to comply with the safety standards of the United States Department of Health, Education and Welfare (21 CFR 1040). Separate registrations by the customer may be required by some states. A number of countries presently have, and others are considering, the adoption of regulations governing the use of laser products. The customer is responsible for determining the extent of regulations governing the use of laser products at their location.
- **Forms**
Prints on discrete form sizes. Utilizes five form depths: 3-1/2 in., 5-1/2 in., 7 in., 8-1/2 in. and 11 in.; ten form widths measured edge to edge: 6-1/2 in., 8-1/2 in., 9-1/2 in., 9-7/8 in., 10-5/8 in., 11 in., 12 in., 12-5/8 in., 14.3 in., 14-7/8 in. which permutes to 50 discrete sizes. Common Use Option Forms are refolded in 7 in. (2 x 3-1/2), 8-1/2 in. and 11 in. (2 x 5-1/2) in lengths.

The ISO Option utilizes six forms depths -- 78.2mm (3 in.), 101.6mm (4 in.), 152.4mm (6 in.), 203.2mm (8 in.), 254.0mm (10 in.), 304.8mm (12 in.) and thirteen forms widths (measured edge to edge) -- 165mm, 180mm, 215mm, 235mm, 250mm, 270mm, 280mm, 305mm, 322mm, 340mm, 363mm, 375mm and 378mm which permute into 78 discrete sizes. ISO Option forms are refolded into 6-, 8-, 10-, and 12-inch lengths. A special feature, ISO Paper Sizes, Add'l (#2743), adds form lengths of 211.6mm (8-1/3 in.) and 317.5mm (12-1/2 in.).

Character and forms overlay printing are restricted from first and last 0.5 inch of forms length. The Paper Sizes, Add'l feature (#2743) allows printing within 1/3 inch of the bottom of the form. A printed line can begin a minimum of 0.5 inch from the left paper edge and cannot exceed a length to position a character nearer than 0.5 inch from the right paper edge for all widths except 14-7/8 in. in compatibility mode where the stated dimension is 0.775 inch from the right.

Paper must be from 15 lb to 24 lb basis weight. See "Forms Design Reference Guide for the IBM 3800 Printing Subsystem", (GA26-1633) for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, print line adjustment is by electronically moving the line. First print position can move to the right 5.7 in. (compatibility mode only) but will cause an equivalent number of positions at the right end to be moved beyond the above defined print line boundaries. It is recommended that printing not occur within 0.100 in. of any binder holes or corner cuts within the form.

Publications: GA32-0049, GA32-0050, SH35-0051, GA26-1633, GC20-0001.

SPECIFY

- **Power (AC, 3-phase):**

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
230V #2827	220V #2800
235V or	230V #9905
240V #2818	240V #9915
380V #2816	
400V #2825	
408V #2819	
415V #2826	
- **Color (for end cover only, machine color is cloud white):**
#9041 for red, #9042 for yellow, #9043 for blue, or #9045 for gray.
- **Machine Nomenclature:**

English #2927	Italian #2932
French #2928	Spanish #2931
German #2929	
- **Paper Sizes: #2741 - Common Use; #2742 - ISO**

Common Use Paper Sizes (#2741): Enables the 3800 to process the following forms depths and widths:

Five Forms Depths (in inches): 3-1/2, 5-1/2, 7, 8-1/2, 11. Ten Forms Widths (in inches, edge to edge): 6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3, 14-7/8. Limitations: Cannot be installed with ISO Paper Sizes (#2742). Maximum: One. Field Installation: RPQ only.

ISO Paper Sizes (#2742): Enables the 3800 to process the following forms depths and widths:

Six Forms Depths (mm (in.)): 76.2 (3), 101.6 (4), 152.4 (6), 203.2 (8), 254.0 (10), 304.8 (12). Thirteen Forms Widths (in mm, edge to edge): 165, 180, 215, 235, 250, 270, 280, 305, 322, 340, 363, 375, 378. Limitations: Cannot be installed with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: RPQ only.
- **Tool Kit: For rental or Term Lease (ICC) customer, select one:**
 1. First 3800 model 1 or 3 ordered, specify #9330 when ordering a model 3.
 2. If unit ordered is second or higher 3800 model 3 to be installed, no additional tool kit is required.
 3. If a 3800 model 1 is installed and a model 3 is ordered to supplement or replace the model 1, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 3.
 4. If 3800 model 1 is being field converted to a model 3, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 3.

MACHINES

5. If required for a multiple machine installation, because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

For purchase customer, select one:

1. For each new purchase 3800 model 3, specify #9330.
2. When rental 3800 model 3s are purchased, a tool kit (#9330) is to be ordered on a no-charge MES for each machine.
3. When a purchased model 1 is being field converted to a model 3, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 3.

Note: A Tool Kit (#9220) is required with Burster-Trimmed-Stacker (#1490); see #1490 below.

SPECIAL FEATURES

Accumulator (#1010): The accumulator is used to generate complex pages that require more fonts than can be held in raster pattern storage. The page can be viewed as having been created in layers (each layer associated with a set of fonts or images). The layers are "accumulated" until the complex page is complete. Images which are too large for raster pattern storage are placed in the accumulator for printing. This feature provides 768K bytes of storage which will hold data for up to 106 sq. in. of image. Maximum: One. Field Installation: Yes.

Accumulator Expansion (#1021): This feature adds 256K bytes of storage to the Accumulator (#1010) for a total of 1024K bytes which will hold data for up to 142 sq. in. of image. For use with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2741.

Accumulator Expansion, ISO (#1022): This feature adds 512K bytes of storage to the Accumulator (#1010) for a total of 1280K bytes which will hold data for up to 178 sq. in. of image. This is only for machines that have ISO Paper Sizes (#2742) and allows printing of the largest image possible on the maximum ISO paper size. Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2742.

Burster-Trimmed-Stacker (#1490): Provides an additional output stacking method. Bursts the five Common Use Paper Sizes (#2741) forms lengths or the six ISO Paper Sizes (#2742) or the two ISO Paper Sizes, Additional (#2743), together with (#2905) to individual sheets and stacks sheets sequentially. Also trims left and right 0.5 inch carrier strip from output sheet. Maximum: One. Field Installation: Yes. Prerequisites: #9220. For rental customer -- specify #9220 for first Burster-Trimmed-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES. For purchase customer -- specify #9220 on each Burster-Trimmed-Stacker feature order. When installed Burster-Trimmed-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

ISO Paper Sizes, Add'l (#2743): Adds two ISO Option form lengths to the printer -- 211.6mm (8-1/3 in.) and 317.5mm (12-1/2 inches).

These lengths can be combined with any of the ISO Option form widths. The 8-1/3 in. form may consist of two 4-1/6 inch forms folded at 8-1/3 in. The 12-1/2 inch form may consist of three 4-1/6 inch forms folded at 12-1/2 in.

Printing within 1/2 or 1/3 inch of the bottom of the form is selectable by the operator. When "1/3 inch" is selected, printing will start 2/3 inch from the top of the form.

This feature corresponds to 3800 model 1 RPQs XA9753, XA9754 and YB0029. These RPQs are not available on the model 3. Paper weights and strength specifications for internal perforations are specified in the "Forms Design Reference Guide for the IBM 3800 Printing Subsystem." (GA26-1633). Limitations: These form lengths cannot be burst by the Burster-Trimmed-Stacker (#1490). This feature is not for use with the Common Use Option (#2741). These form lengths cannot be burst by the Burster-Trimmed-Stacker (#1490). In order to burst the paper sizes offered by Feature (#2743), specify ISO Paper Sizes, Add'l-BTS (#2905). Maximum: One. Field Installation: Yes. Prerequisites: #2742.

Raster Pattern Storage, Add'l (#5410): Base machine comes with 256K bytes, storage maximum is 512K bytes in one additional storage increment of 256K bytes. Provides font storage for multiple character sets and can be used to hold small images. Maximum: One. Field Installation: Yes.

Remote Switch Attachment (#6158): To attach the Two-Channel Switch (#8180) to a configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8180.

Two-Channel Switch (#8180): To attach the 3800 to two S/370, 30XX, or 4300 Processor channels which may be on the same CPU or on two different CPUs. The two interfaces can have different addresses. The two-channel switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. Maximum: One. Field Installation: Yes.

Dynamic Two-Channel Switch (#8181): Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems and to attach to two channels from a single CPU to provide alternate path capability. For either tightly coupled multiprocessors or single CPU attachments, data transfer occurs only one channel path at a time. Maximum: One. Field Installation: Yes. Prerequisites: #8180.

MODEL CONVERSION

3800 model 1s which are purchased or under an ICC Term Lease can be converted to a model 3 by MES. Conversion from a 3800 model 3 to a 3800 model 1 is not available.

ACCESSORIES (NONE)

SUPPLIES

Contact your Country DP Supplies Coordinator.

3800 PRINTING SUBSYSTEM MODEL 6

PURPOSE

Printer output unit for 3081, 3083, 3084, 3090, 4361 Model Group 5 and 4381 Processors.

The 3800 Printing Subsystem Model 6 is an intermediate speed AFP fanfold printer that uses an electro-photographic process to print up to 134 pages per minute. The 3800 Printing Subsystem Model 6 provides printing with a density of 240x240 dots (pels) per square inch. There are two modes of operation: Compatibility Mode which prints 3800 Model 1 applications with a minimum of change to the application program and Advanced Function Printing mode which prints complex pages of image, text, graphics, and system printing applications.

Note: Operating System support for the model 6 is provided under MVS/370, MVS/XA, VM/SP, VM/SP HPO, VSE/SP, and VSE/AF.

MODEL 6

Model 6 006

Prerequisites: A control unit position on a system channel is required.

Note: The model 6 does not provide for attachment to a byte multiplexer channel.

Processor Attachment

- 3081 Processor: Block multiplexer channels (up to 24 possible, 20 if 4-byte multiplexer channels are installed) – the 3081 requires system EC 213971 (including microcode EC 214788) to operate with the 3800 model 6; see M3081 pages.
- 3083 Processor: Block multiplexer channels (up to 24 possible, 20 if 4-byte multiplexer channels are installed); see M3083 pages.
- 3084 Processor: Block multiplexer channels (up to 24 possible per side, 20 if 4-byte multiplexer channels are installed); see M3084 pages.
- 3090 model 150 Processor: Block multiplexer channels (up to 24 possible, 16 standard and eight optional; see M3090 model 150 pages.
- 3090 model 180 Processor: Block multiplexer channels (up to 32 possible, 16 standard and 16 optional; see M3090 model 180 pages.
- 3090 model 200 Processor: Block multiplexer channels (up to 48 possible, 44 if 4-byte multiplexer channels are installed; see M3090 model 200 pages.
- 3090 model 400 Processor: Block multiplexer channels (up to 48 per side, 44 if 4-byte multiplexer channels are installed; see M3090 model 400 pages.
- 4300 Processor: Block multiplexer channel; M4361, 4381 pages.
- 9370 Processor: Block multiplexer channel; see M9373, 9375, 9377 pages.

HIGHLIGHTS

The 3800 Printing Subsystem Model 6 can be ordered as follows:

- Base Unit: IBM covers and a single channel attachment which can operate in either DCI or data streaming mode.

- Base Unit with the 3810 Feature which includes: a two-channel switch, accumulator (and expansion), and 512K bytes of raster pattern storage.
 - Base Unit with any of the 3800 Model 3 Features.
- Note:** This option will have a longer delivery schedule than the first two.
- The Double Byte Character Set Font Storage RPQ (8A5008) can be requested with any of the above configurations.

This RPQ supports double-byte character set font sizes from 22x22 pels to 64x64 pels.

All the 3800 Model 3 features are available for field install on the 3800 Printing Subsystem Model 6, and all RPQs will be evaluated on an individual basis. (Note: Feature 3810 will not be provided as a field installed MES).

The 3800 Printing Subsystem Model 6 will appear to the S/370 software interface as a 3800 Printing Subsystem Model 3 or 8, and thus require no software changes. The customer must define the 3800 Printing Subsystem Model 6 as a 3800 Printing Subsystem Model 3 or 8 to the system.

The model 6 prints on single part continuous forms. The common paper sizes are provided in 50 discrete paper sizes. ISO machines are equipped to support 78 or 104 discrete paper sizes depending on the specify options selected. Printing is repeated for multiple copies and every copy is "original" quality.

Printing throughput can vary depending on form length, number of copies needed, and functions exercised. Throughput of up to 12,480 lines per minute can be achieved (see accompanying table).

Print Speed Range: The following speeds apply to the 3800 model 6 in Compatibility mode. The number of characters per line depends upon the form width being used. The speeds shown for 12 lpi are applicable when a maximum of 190 characters, including blanks, are printed on each line.

Common Use Option

Forms		Lines Per Minute *				
Lngth (in.)	Per Min.	6 lpi	8 lpi	10 lpi	12 lpi	
	Up To:	Up to:	Up to:	Up to:	Up to:	
3-1/2	328	4,920	6,560	8,220	9,840	
5-1/2	208	5,616	7,488	9,360	11,232	
7	164	5,904	7,872	9,840	11,808	
8-1/2	134	6,030	8,040	10,050	12,060	
11	104	6,240	8,320	10,400	12,480	

* Single copy speeds

ISO Option

Forms		Lines Per Minute*				
Lngth (in.)	Per Min.	6 lpi	8 lpi	10 lpi	12 lpi	
	Up to:	Up to:	Up to:	Up to:	Up to:	
3	373	4,476	5,968	7,460	8,952	
4	283	5,094	6,792	8,490	10,188	
4-1/6	268	5,091	6,789	8,496	10,183	
6	178	5,340	7,120	8,900	10,680	
8	134	5,620	7,504	9,380	11,256	
8-1/3	134	5,620	7,504	9,380	11,256	
10	104	5,616	7,488	9,360	11,232	

12	89	5,874	7,832	9,790	11,748
12-1/2	89	5,874	7,832	9,790	11,748

* Single copy speeds.

Note: 8 1/3 and 12 1/2 lengths are available only by specifying option #2744.

Compatibility Mode: When operating in Compatibility mode the model 6 can perform the functions of the 3800 model 1, plus print at 10 lines per inch. This provides for easy migration of 3800 model 1 applications.

Note: The model 6 does not have a Tape-to-Printing Subsystem feature which is available for the 3800 model 1.

In Compatibility Mode the 3800 model 1 electronic character generation is emulated, providing 255 WCGM storage positions, organized in four 64-character Writeable Character Generation Modules (WCGM). Character sets are program selected without operator intervention and dynamically loaded into hardware WCGMs. Dynamic storage allows character substitution under program control. Customers may design their own characters. The following standard 3800 model 1 character sets are provided with Data Facility Product for 240x240 pel printing:

Character Sets Standard

Character Style	Pitch (cpi)			Special Underscored
	10	12	15	
Gothic	X	X	X	Yes
Gothic 15 Condensed	X			Yes
Text 1 (Upper Case)	X			Yes
Text 2 (Lower Case)	X			Yes
OCR A	X			
OCR B	X			
Format	X	X	X	
Katakana	X	X	X	

Note: Includes World Trade National Use Graphics. Twenty-three fonts from the 6670 have been prepared for use with the 3800 model 6 in Compatibility mode. These characters were originally designed for 240x240 pel printing.

All-Points-Addressable Mode: This mode is supported by Print Services Facility (5665-275), Print Management Facility (5665-307) and Overlay Generation Language (5665-308). Also, see Document Composition Facility (5748-XX9) and Graphical Data Display Manager (5748-XXH). Compatibility mode is also supported by:

- MVS/370:
 - MVS/SP-JES2 Version 1 Release 3.3 or later
 - MVS/SP-JES3 Version 1 Release 3.1 or later
 - MVS/370 Data Facility Product Release 1.0 or later
- MVS/XA:
 - MVS/SP-JES2 Version 2 Release 1.2 or later
 - MVS/SP-JES3 Version 2 Release 1.2 or later
 - MVS/XA Data Facility Product Release 1.2 or later
- VM:
 - VM/System Product (VM/SP) Release 3
 - VM/SP High Performance Option (HPO) Release 3.2

Printer Commands: Characters can be positioned at any defined point on the printable area of the page. Alphameric text can be generated in three orientations (one horizontal and two vertical). Proportional-spaced and fixed-space fonts ranging in size from 4 to 36 "points" can be printed. (A "point" is 1/72 inch and is a measure of character size. This should not be confused with a printable raster point, also called a pel.)

With the base machine multiple fonts can be mixed within one data set. The number of fonts which can be present in the base machine depends upon the character size and the number of characters in the font.

Solid and dashed lines can be generated horizontally and vertically from any defined point in the printable area of the page for any specified length as long as the line remains within the printable area of the page.

Raster images of logos, signatures, drawings and photographs up to full-page size can be printed. The images are printed in raster form of 240x240 dots per square inch. Images in raster form of 120x120 dots per square inch are accepted. For these the printer generates four dots for each one indicated, producing a facsimile the same size as the original. The Accumulator feature (#1010) is required for images larger than those which can be held in the raster pattern storage where the image size depends on the raster pattern storage installed and the amount required for fonts. (Images cannot be printed in compatibility mode.)

Quality considerations in the printing of images are similar to those for printing a forms overlay, e.g., line widths and large dark areas. These guidelines and restrictions are presented in the "Forms Design Reference Guide for the IBM 3800 Printing Subsystem", GA26-1633.

A major extension has been made to provide "electronic overlay generation". The new capabilities allow a form to be printed from a sequence of printer commands which print lines (creating boxes), constant alphameric text, shaded areas, and images for signatures, logos, etc. This information (the electronic overlay) is merged by the printer with the variable data for a given page and printed. This capability will allow many custom forms of different sizes to be printed on blank paper.

Multiple electronic overlays can be held in the base printer and used on demand within one application. The maximum addressable number is 127. The maximum for an application will depend on the complexity of the electronic overlay and the demands made by the application on the control storage. Up to eight electronic overlays can be merged onto a single page. (Depending upon the complexity, throughput may be impacted.)

Double Byte Character Set Font Storage RPQ (8A5008) - (DBCS): The DBCS capability is designed to provide character sets with more than 256 characters. The characters are addressed by a two-byte code. The 3800 model 6 will support approximately 22,500 two-byte characters when the Double Byte Character Set Font Storage RPQ is installed on it.

The minimum character size is 22x22 pels while the maximum character size is 64x64 pels, approximately one-quarter inch or 6.77mm square.

This capability applies to ideographic language characters such as Japanese, Chinese, Korean, etc. Characters from different languages can be printed at the same time. DBCS characters of different sizes can be intermixed on the same line as can one-byte characters. DBCS character sets may be intermixed with one-byte character sets, for example, English, German, etc.

A total of 64 character sets can be in the printer, provided the storage space is available. This includes the combination of one- and two-byte character sets and the three default character sets which reside in the printer. DBCS characters are stored in a compressed form which is automatically decompressed by the printer at printing time.

Note: The DBCS capability operates only in the all-points-addressable mode.

Storage: A control storage of 512K bytes is provided in the base printer. This provides storage for the microcode, page buffers, tables associated with character fonts, etc.; a raster pattern storage with 256K bytes is provided in the base machine for multiple character sets and for limited storage of image data. Up to 512K bytes total is available by an incremental feature of 256K bytes or as a part of feature 3810 as mentioned in "Highlights". Fonts are stored in raster pattern storage and the amount of storage required is a function of the character size and the number of characters in the

font. A font can have a maximum of 256 characters. An Accumulator feature (#1010) may be added (or as part of #3810). It provides 768K bytes additional accumulator storage allowing more complex pages to be created for printing on a limited number of Common and ISO paper sizes. This accumulator storage may be increased by either (not both) one of the following expansion features:

- The Accumulator Common Expansion (#1021) may be added (or as part of #3810) providing an additional increment of 256K bytes for a total of 1024K bytes additional accumulator storage and support to all Common paper sizes and an expanded number of ISO paper sizes.
- The Accumulator ISO Expansion (#1022) may be added providing an additional increment of 512K bytes for a total of 1280K bytes additional accumulator storage and support to all Common paper sizes and ISO paper sizes (up to a 14 7/8 x 12-inch page).

The first increment is 768K bytes with common machines having one more increment of 256K bytes, for a total of 1K bytes (or as part of 3810). ISO machines have expansions to a total of either 1,024K bytes or 1,280 bytes.

ADDITIONAL HIGHLIGHTS

Note: Some of the following highlights apply to the model 6 only when operating in compatibility mode and are so indicated.

- Gothic 15
(15 characters/inch at 8 or 10 lines/inch) - 11 in. x 14-7/8 in. reports can be reduced to 8-1/2 in. x 11 in.; convenient size; increased throughput, reduced forms cost, reduced filing space by using the maximum print span of 204 positions. The application of 12 lpi vertical spacing with the Gothic 15 Condensed character set can result in a reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.
- Optical Character Recognition (OCR): Printing the 3800 Printing Subsystem Model 6 can be used for OCR applications.
 - Due to variability of OCR applications and readers, IBM advises that the customer evaluate the 3800 Printing Subsystem Model 6 OCR output in their application environment.
 - Particular care should be taken when transferring OCR applications from the IBM Printing Subsystem Model 3 to the IBM Printing Subsystem Model 6. Variations in print density and resolution should be thoroughly tested for reading compatibility before committing his OCR applications to the IBM 3800 Printing Subsystem Model 6.

The following are the paragraphs describing the OCR fonts and their usage on the 3800 Model 6:

Alphanumeric OCR A and the less stylized OCR B fonts can be intermixed with non-OCR fonts with no reduction in printing throughput. Documents may be processed by the 1287, 1288, 3762 and 3886 Optical Character Readers. Refer to the appropriate pages for specific capabilities.

Note: The OCR-A characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the United States of America Standard Character Set for Optical Character Recognition, Size A, USAS X3.17-1977. The OCR-B characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the United States of America Standard Character Set for Optical Character Recognition, Size B, USAS X3.17-1975 and the European Computer Manufacturers Association's Standard ECMA-11 for Alphanumeric Character Set OCR-B for Optical Recognition, (EMCA 11-1975).

- Text Character Set

Upper and lower case characters with serifs; special graphics; no reduction in throughput.

Note: The model 6 has extensive text capabilities in the all-points-addressable mode plus the availability of some 6670 fonts which can be used in compatibility mode.

- Format 10, 12 and 15 Pitch
Merge format and data; program controlled for on-line operation (compatibility mode only).
- Copy Modification Function (Compatibility mode only)
Identify copies with legends, phrases, or names (e.g., Customer Copy, For Accounting Purposes Only, etc.); address each report copy to speed distribution; spot carbon or field blackout functions; identification and deletion program controlled. Provides customized forms with the identification, deletion and formatting functions.
- Forms Overlay (both modes)
Optical image system; prints high quality document and report formats, designs or other constant data; merge format and data; program controlled.
- Single Part Continuous Form Output
Including custom printed forms; no deleaving; no carbon disposal; faster job separation making use of the Mark Form function.

- Optional Channel Switching

Manual switches provide system configuration flexibility through the use of the 3814 Switching Management System, or the 2914 Manual Switch model 1 (RPQ 880882), or the Two-Channel Switch (#8180); automatic switching is provided by the Dynamic Two-Channel Switch (#8181) for two processors in a tightly coupled multiprocessing configuration, and two channels on a single CPU providing alternate path capability.

- Laser Safety

A number of countries presently have, and others are considering, the adoption of regulations governing the use of laser products. The customer is responsible for determining the extent of regulations governing the use of laser products at their location.

- Forms

Prints on discrete form sizes. Utilizes five form depths: 3-1/2 in., 5-1/2 in., 7 in., 8-1/2 in. and 11 in.; ten form widths measured edge to edge: 6-1/2 in., 8-1/2 in., 9-1/2 in., 9-7/8 in., 10-5/8 in., 11 in., 12 in., 12-5/8 in., 14.3 in., 14-7/8 in. which permutes to 50 discrete sizes. Common Use Option Forms are refolded in 7 in. (2 x 3-1/2), 8-1/2 in. and 11 in. (2 x 5-1/2) in lengths. The ISO machines utilize six forms depths -- 78.2mm (3 in.), 101.6mm (4 in.), 152.4mm (6 in.), 203.2mm (8 in.), 254.0mm (10 in.), 304.8mm (12 in.), and thirteen forms widths (measured edge to edge) -- 165mm, 180mm, 215mm, 235mm, 250mm, 270mm, 280mm, 305mm, 322mm, 340mm, 363mm, 375mm and 378mm which permute into 104 discrete sizes. Forms are refolded into 6-, 8-, 10-, and 12-inch lengths.

Character and forms overlay printing are restricted from first and last 0.5 inch of forms length. A printed line can begin a minimum of 0.5 inch from the left paper edge and cannot exceed a length to position a character nearer than 0.5 inch from the right paper edge for all widths except 14-7/8 in. in compatibility mode where the stated dimension is 0.775 inch from the right.

Paper must be from 15 lb to 24 lb basis weight. See "Forms Design Reference Guide for the IBM 3800 Printing Subsystem", (GA26-1633) for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, print line adjustment is by electronically moving the line. First print position can move to the right 5.7 in. (compatibility mode only) but will cause an equivalent number of po-

sitions at the right end to be moved beyond the above defined print line boundaries. It is recommended that printing not occur within 0.100 in. of any binder holes or corner cuts within the form.

Publications: GA32-0049, GA32-0050, SH35-0051, GA26-1633, GC20-0001.

SPECIFY

● Power (AC, 3-phase):

50 Hz	60 Hz
200V #2807	208V #9903
220V #2815	220V #2800
230V #2827	230V #9905
235V or	240V #9915
240V #2818	
380V #2816	
400V #2825	
408V #2819	
415V #2826	

● Color (for end cover only, machine color is cloud white): #9041 for red, #9042 for yellow cover, #9043 for blue, and #9045 for gray.

● Machine Nomenclature:

English	#2927	Italian	#2932
French	#2928	Spanish	#2931
German	#2929		

● Paper Sizes: #2741 - Common Use; #2742 - ISO

- Common Use Paper Sizes (#2741): Enables the 3800 to process the following forms depths and widths:

Five Forms Depths (in inches): 3-1/2, 5-1/2, 7, 8-1/2, 11. Ten Forms Widths (in inches, edge to edge): 6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3, 14-7/8. Limitations: Cannot be installed with ISO Paper Sizes (#2742) or extended ISO paper sizes (#2744). Maximum: One. Field Installation: RPQ only.

- Sizes (#2742): Enables the 3800 to process the following forms depths and widths:

Six Forms Depths (mm (in.)): 76.2 (3), 101.6 (4), 152.4 (6), 203.2 (8), 254.0 (10), 304.8 (12). Thirteen Forms Widths (in mm, edge to edge): 165, 180, 215, 235, 250, 270, 280, 305, 322, 340, 363, 375, 378. Limitations: Cannot be installed with Common Use Paper Sizes (#2741) or extended ISO paper sizes (#2744). Maximum: One. Field Installation: RPQ only.

● Tool Kit:

For rental or term lease (ICC) customer, select one:

- First 3800 Model 6, specify #9330 when ordering a Model 6.
- If unit ordered is second 3800 Model 6 to be installed, no additional tool kit is required.
- If required for a multiple machine installation, because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

For purchase customer, select one:

- For each new purchase 3800 Model 6, specify #9330.

- When rental 3800 Model 6s are purchased, a tool kit (#9330) is to be ordered on a no-charge MES for each machine.

Note: A Tool Kit (#9220) is required with Burster-Trimmed-Stacker (#1490); see #1490 below.

SPECIAL AND STANDARD FEATURES

Accumulator (#1010) (Special): The accumulator is used to generate complex pages that cannot be built in writable control store or that use images that are too large to fit in raster pattern storage. The page can be viewed as having been created in layers (each layer associated with a set of fonts or images). The layers are "accumulated" until the complex page is complete. Images which are too large for raster pattern storage are placed in the accumulator for printing. This feature provides 768K bytes of storage which will hold data for up to 106 sq. in. of image. Maximum: One. Field Installation: Yes.

Accumulator Expansion (#1021) - (Special): This feature adds 256K bytes of storage to the Accumulator (#1010) for a total of 1024K bytes which will hold data for up to 142 sq. in. of image. For use with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2741.

Accumulator Expansion, ISO (#1022) - (Special): This feature adds 512K bytes of storage to the Accumulator (#1010) for a total of 1280K bytes which will hold data for up to 178 sq. in. of image. This is only for machines that have ISO paper sizes (#2742) or (#2744) and allows printing of the largest image possible on the maximum ISO paper size. Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2742 or #2744.

Burster-Trimmed-Stacker (#1490) (Special): Provides an additional output stacking method. Bursts the five common Paper Sizes (#2741) or the six ISO paper sizes of (#2742) or the eight paper sizes of (#2744) together with (#2905) (if the customer bursts 8 1/3 or 12 1/2 inch forms) to individual sheets and stacks sheets sequentially. Also trims left and right 0.5 inch carrier strip from output sheet. Maximum: One. Field Installation: Yes. Prerequisites: #9220. For rental customer -- specify #9220 for first Burster-Trimmed-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES. For purchase customer -- specify #9220 on each Burster-Trimmed-Stacker feature order. When installed Burster-Trimmed-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature. Maximum: One. Field Installation: Yes.

ISO Paper Sizes, Additional - BTS (#2905) (Special): Provides bursting capabilities for the eight form sizes provided in extended ISO Paper Sizes (#2744). Limitations: Cannot be used with Common Paper Sizes (#2741) or ISO Paper Sizes (#2742). Maximum: One. Prerequisites: #2744 and #1490. Field Installation: Yes.

Expansion - Common (#3810) - (Special): The feature offers the following features in one package:

1. Accumulator (#1010)
2. Accumulator Expansion (#1021 or #1022)
3. Raster Pattern Store Additional (#5410)
4. Two Channel Switch (#8180)

Maximum: One. Field Installation: No.

Raster Pattern Storage, Additional (#5410) (Special): Base machine comes with 256K bytes, storage maximum is 512K bytes in one additional storage increment of 256K bytes. Provides font storage for multiple character sets and can be used to hold small images. Maximum: One. Field Installation: Yes.

Remote Switch Attachment (#6158) (Special): To attach the Two-Channel Switch (#8180) to a configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8180 or #3810.

MACHINES

Two-Channel Switch (#8180) (Special): To attach the 3800 to two S/370, 308X, 3090, or 4300 Processor channels which may be on the same CPU or on two different CPUs. The two interfaces can have different addresses. The two-channel switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. Maximum: One. Field Installation: Yes.

Dynamic Two-Channel Switch (#8181) (Special): Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems and to attach to two channels from a single CPU to provide alternate path capability. For either tightly coupled multiprocessors or single CPU attachments, data transfer occurs only one channel path at a time. Maximum: One. Field Installation: Yes. Prerequisites: #8180 or 3810.

(APG only > Double Byte Character Set Font Storage RPQ (8A5008): Provides for character sets with more than 256 characters. The characters are addressed by a two-byte code. The 3800 model 6 will support approximately 22,500 two-byte characters when the Double

Byte Character Set Font Storage RPQ is installed on it. The maximum character size is 64x64 pels, approximately one-quarter inch or 6.77mm square. Maximum: One. Field Installation: No. Prerequisites: None <)

MODEL CONVERSIONS

A 3800 model 6 which is purchased or under an ICC Term Lease can be converted to a model 3 by MES (available at a later date). Conversion from a 3800 model 3 to a 3800 model 6 is not available.

ACCESSORIES (NONE)

SUPPLIES

Contact your Country DP Supplies Coordinator.

3800 PRINTING SUBSYSTEM MODEL 8

PURPOSE

Printer output unit for S/370 models 158, 168, and the 3031, 3032, 3033, 3081, 3083, 3084, 3090, 4341, 4361 Model Group 5, and 4381 Processors.

MODEL 8

Model 8 008

Limitations: Operating System support for the model 8 is provided only under MVS/370 and MVS/XA.

Prerequisites: A control unit position on a system channel is required.

Note: The model 8 does not provide for attachment to a byte multiplexer channel.

Processor Attachment:

- S/370 model 158: Block Multiplexer Channels (first two are standard). The model 158-1 requires EC 278240 to operate with the 3800 model 8. The model 158-3 requires EC 278249 to operate with the 3800 model 8. See M3158, 3158-3 pages.
- S/370 model 168: Selector channel of 2860, Selector Sub-channel (special feature) of 2870, shared or non-shared sub-channel of 2880; see M2860, 2870, 2880 pages. Selector channel attachment is not recommended unless dedicated to the printer; see M3168 pages.
- 3031 or 3032 Processor: Block multiplexer channels (five are standard); the 3031 and 3032 require EC#279679 to operate with the 3800 model 8. See M3031 and 3032 pages.
- 3033 Processor: On models U,A, and M block multiplexer channels (ten are standard); On model Group N block multiplexer channels (five are standard, five are optional); On model Group S block multiplexer channel (five are standard). The 3033 requires EC#279679 to operate with the 3800 model 8. See M3033 pages.
- 3081 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed); the 3081 requires system EC#213971 (including microcode EC#214788) to operate with the 3800 model 8; see M3081 pages.
- 3083 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed); see M3083 pages.
- 3084 Processor: Block multiplexer channels (up to 24 possible per side, 20 if 4 byte multiplexer channels are installed); see M3084 pages.
- 3090 model 200 Processor: Block multiplexer channels (up to 48 possible, 44 if 4 byte multiplexer channels are installed); see M3090 model 200 pages.
- 3090 model 400 Processor: Block multiplexer channels (up to 48 per side, 44 if 4 byte multiplexer channels are installed); see M3090 model 400 pages.
- 4300 Processor: Block multiplexer channel; see M4341, 4361, 4381 pages.
- 9370 Processor: Block multiplexer channel; see M9373, 9375, 9377 pages.

HIGHLIGHTS

The 3800 model 8 provides --- printing with density of 240 x 240 dots per square inch at up to 20,040 lines per minute --- Extended

Graphics capability which allows printing of up to 11,970 unique characters in a single character set --- approximately 22,500 Extended Graphics characters can be held in the printer.

The 3800 model 8 prints on single-part continuous forms --- equipped for either of two paper size standards: The Common Use option, which supports 50 discrete paper sizes or the ISO option, which supports 78 discrete paper sizes. Printing is repeated for multiple copies, and every copy is of "original" quality.

There are two modes of operation --- compatibility mode which prints 3800 model 1 applications with a minimum of change to the application and "all-points-addressable" mode which prints complex pages for image, text, graphics and system printing applications. All-points-addressable mode is also called Page mode.

Compatibility Mode: When operating in compatibility mode the model 8 can perform the functions of the 3800 model 1 plus print at 10 lines per inch. This provides for easy migration of 3800 model 1 applications. Compatibility mode is supported by MVS/370 Data Facility Product Release 1.1 (5665-295), MVS/XA Data Facility Product Version 1 Release 1.2 (5665-284), MVS/XA Data Facility Product Version 2 Release 1.0 (5665-XA2) and Data Facility Device Support Release 1.6 (5740-AM7).

In Compatibility Mode the 3800 model 1 electronic character generation is emulated, providing 255 WCGM storage positions, organized in four 64 character Writeable Character Generation Modules (WCGM). Character sets are program selected without operator intervention and dynamically loaded into hardware WCGMs. Dynamic storage allows character substitution under program control. Customers may design their own characters. The following standard 3800 model 1 character sets are provided with MVS/370 Data Facility Product Release 1.1 (5665-295), MVS/XA Data Facility Product Version 1 Release 1.2 (5665-284), MVS/XA Data Facility Product Version 2 Release 1.0 (5665-XA2) and Data Facility Device Support Release 1.6 (5740-AM7) for 240 x 240 pel printing:

Character Sets	Standard			Special Underscored
	Pitch(cpi)	10	12	15
Gothic	X	X	X	Yes
Gothic 15				
Condensed			X	Yes
Text 1 (Upper Case)	X			Yes
Text 2 (Lower Case)	X			Yes
OCR A	X			
OCR B	X			
Format	X	X	X	
Katakana	X	X	X	

Note: Includes World Trade National Use Graphics.

The 16 fonts provided with Document Composition Facility (5748-XX9), Release 2, are also provided in 240 x 240 pel form. Twenty-three fonts from the 6670 have been prepared for use with the 3800 model 8 in compatibility mode. These characters were originally designed for 240 x 240 pel printing.

Customers can convert existing customer-created 3800 model 1 character sets or create new characters in the 240x240 pel density - see Print Management Facility (5665-307) or Character Conversion Aid (5665-299) pages.

Printing throughput can vary depending on form length, number of copies needed, and functions exercised.

Note: Compatibility mode emulates the 3800 model 1. There is no emulation of the 3800 model 2. Also, the model 8 does not have a Tape-to-Printing Subsystem feature which is available for the 3800 model 1.

Print Speed Range: The following speeds apply to the 3800 model 8 in compatibility mode. The number of characters per line depends upon the form width being used. The speeds shown for 12 lpi are applicable when a maximum of 190 characters, including blanks, are printed on each line.

Common Use Option

Forms	Forms	Lines Per Minute *			
Per					
Lngth Min.	6 lpi	8 lpi	10 lpi	12 lpi	
(in.) Up To:	Up to:	Up to:	Up to:	Up to:	
3-1/2	526	7,890	10,520	13,150	15,780
5-1/2	334	9,018	12,024	15,030	18,036
7	263	9,468	12,624	15,780	18,936
8-1/2	215	9,675	12,900	16,125	19,350
11	167	10,020	13,360	16,700	20,040

ISO Option

Forms	Forms	Lines Per Minute *			
Per					
Lngth Min.	6 lpi	8 lpi	10 lpi	12 lpi	
(in.) Up To:	Up to:	Up to:	Up to:	Up to:

8	215	9,030	12,040	15,050	18,060
10	167	9,018	12,024	15,030	18,036
12	143	9,438	12,584	15,730	18,876

* Single copy speeds

All-Points-Addressable Mode: This mode is supported by Print Services Facility (5665-275), Print Management Facility (5665-307) and Overlay Generation Language (5665-308). Also, see Document Composition Facility (5748-XX9) and Graphical Data Display Manager (5748-XXH). Compatibility mode is also supported by MVS/370 Data Facility Product Release 1.1 (5665-295) and MVS/XA Data Facility Product Release 1.2 (5665-284).

New printer commands provide the following functions: Characters can be positioned at any defined point on the printable area of the page. Alphameric text can be generated in three orientations (one horizontal and two vertical). Proportional-spaced and fixed-space fonts ranging in size from 4 to 36 "points" can be printed. (A "point" is 1/72 inch and is a measure of character size. This should not be confused with a printable raster point, also called a Pel.)

With the base machine multiple fonts can be mixed within one data set. The number of fonts depends upon the character size and the number of characters in the font. Fonts can be loaded from the host into the printer and stored on the internal diskette (with user provided programming) or in raster pattern storage.

Solid and dashed lines can be generated horizontally and vertically from any defined point in the printable area of the page for any specified length as long as the line remains within the printable area of the page.

Raster images of logos, signatures, drawings and photographs up to full-page size can be printed. The images are printed in raster form of 240 x 240 dots per square inch. Images in raster form of 120 x 120 dots per square inch are accepted. For these the printer generates four dots for each one indicated, producing a facsimile the same size as the original. The Accumulator feature (#1010) is required for images larger than those which can be held in the raster pattern storage where the image size depends on the raster pattern storage installed and the amount required for fonts. (Images cannot be printed in Compatibility mode.)

Quality considerations in the printing of images are similar to those for printing a forms overlay, e.g., line widths and large dark areas. These guidelines and restrictions are presented in the "Forms Design Reference Guide for the IBM 3800 Printing Subsystem", GA26-1633.

A major extension has been made to provide "electronic overlay generation". The new capabilities allow a form to be printed from a sequence of printer commands which print lines (creating boxes), constant alphameric text, shaded areas, and images for signatures, logos etc. This information (the electronic overlay) is merged by the printer with the variable data for a given page and printed. This capability will allow many custom forms to be printed on blank paper.

Multiple electronic overlays can be held in the base printer and used on demand within one application. The maximum addressable number is 127. The maximum for an application will depend on the complexity of the electronic overlay and the demands made by the application on the control storage. Up to eight electronic overlays can be merged onto a single page. (Dependent upon the complexity, throughput may be impacted.)

Extended Graphics: The Extended Graphics capability is designed to provide character sets with more than 256 characters. The characters are addressed by a two-byte code. The 3800 model 8 supports approximately 22,500 two-byte characters. The maximum character size is 64 x 64 pels, approximately one-quarter inch or 6.77mm square.

This capability applies to ideographic language characters such as Japanese, Chinese, Korean, etc. Characters from different languages can be printed at the same time. Extended graphics characters of different sizes can be intermixed on the same line as can one-byte characters. Extended graphics character sets may be intermixed with one-byte character sets, for example, English, German, etc. The 3800 model 8 can process jobs not containing extended graphic data.

A total of 64 character sets can be in the printer, provided the storage space is available. This includes the combination of one- and two-byte character sets and the three default character sets which reside in the printer. Extended graphics characters are stored in a compressed form which is automatically decompressed by the printer at printing time.

Note: The extended graphic capability operates only in the all-points-addressable mode.

Storage: A control storage of 512K bytes is provided in the base printer. This provides storage for the microcode, page buffers, tables associated with character fonts, etc.

A raster pattern storage with 256K bytes is provided in the base machine for multiple character sets and for storage of small images. Up to 512K bytes total is available by an incremental feature of 256K bytes. One-byte character sets are stored in raster pattern storage. The amount of storage required is a function of the character size and the number of characters in the character set. A character set can have a maximum of 256 characters.

An Accumulator feature (#1010) may be added. It allows more complex pages to be printed. The first increment is 768K bytes with expansion to a total of either 1,024K bytes or 1,280K bytes. This allows printing the maximum image on the maximum form size available with the Common Use or ISO Paper Sizes, respectively.

ADDITIONAL HIGHLIGHTS

Note: Some of the following highlights apply to the model 8 only when operating in compatibility mode and are so indicated.

● Gothic 15

(15 characters/inch at 8 or 10 lines/inch) 11 in. x 14-7/8 in. reports can be reduced to 8-1/2" x 11"; convenient size; increased throughput, reduced forms cost, reduced filing space by using the maximum print span of 204 positions. The application of 12 lpi vertical spacing with the Gothic 15 Condensed

character set can result in a reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.

- Optical Character

Recognition (OCR) Printing alphanumeric OCR A and the less stylized OCR B characters can be intermixed with non-OCR characters with no reduction in printing throughput. Documents may be processed by the 1287, 1288, 3762 and 3886 Optical Character Readers. Refer to the appropriate sales manual pages for specific capabilities.

Note: The OCR-A characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the "United States of America Standard Character Set for Optical Character Recognition, Size A, USAS X3.17-1977". The OCR-B characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the "United States of America Standard Character Set for Optical Character Recognition, Size B, USAS X3.17-1975" and the "European Computer Manufacturers Association's Standard ECMA-11 for Alphanumeric Character Set OCR-B for Optical Recognition" (EMCA 11-1975).

- Copy Modification

Function (Compatibility mode) identify copies with legends, phrases, or names (e.g., Customer Copy, For Accounting Purposes Only, etc.); address each report copy to speed distribution; spot carbon or field blackout functions; identification and deletion program controlled. Provides customized forms with the identification, deletion and formatting functions.

- Forms Overlay (both modes)

Optical image system; prints high quality document and report formats, designs or other constant data; merge format and data; program controlled.

- Single Part Continuous Form Output

Including custom printed forms; no delevaing; no carbon disposal; faster job separation making use of the Mark Form function.

Printing is on single part continuous forms Common Use sizes or ISO sizes. Printing is repeated for multiple copies. Every copy is original quality.

- Optional Burster-Trimmed-Stacker Output

Eliminates bursting and delevaing bottlenecks; offset separation between data set copies; remove output while printing; first-in, first-out job sequence; trimmed edges.

- Optional Channel Switching

Manual switches provide system configuration flexibility through the use of the 3814 Switching Management System, or the 2914 Manual Switch model 1 (RPQ 880882), or the Two-Channel Switch (#8180); automatic switching is provided by the Dynamic Two-Channel Switch (#8181) for two processors in a tightly coupled multiprocessing configuration, and two channels on a single CPU providing alternate path capability.

- Laser Safety

The 3800 contains a laser assembly. A number of countries presently have, and others are considering, the adoption of regulations governing the use of laser products. The customer is responsible for determining the extent of regulations governing the use of laser products at their location.

- Forms

Prints on discrete form sizes. Common Use Paper Sizes:

Utilizes five form depths -- 3-1/2 in., 5-1/2 in., 7 in., 8-1/2 in., 11 in. and ten form widths (measured edge to edge) -- 6-1/2 in., 8-1/2 in., 9-1/2 in., 9-7/8 in., 10-5/8 in., 11 in., 12 in., 12-5/8 in., 14.3 in., 14-7/8 in. which permutes to 50 discrete sizes. Forms

are refolded in 7 in. (2 x 3-1/2), 8-1/2 in. and 11 in. (2 x 5-1/2) in lengths.

- ISO Paper Sizes

Six form depths of 3 in., 4 in., 6 in., 8 in., 10 in., 12 in. and thirteen form widths (measured edge to edge) of 165, 180, 215, 235, 250, 270, 280, 305, 322, 340, 363, 375, 378mm. Forms are refolded into 6-, 8-, 10-, and 12-inch lengths.

Character and forms overlay printing restricted from first and last 0.5 inch of forms length. A printed line can begin a minimum of 0.5 inch from the left paper edge and cannot exceed a length to position a character nearer than 0.5 in. from the right paper edge for all widths except 14-7/8 in. in compatibility mode where the stated dimension is 0.775 inch from the right.

Paper weight must be from 56 to 90 grams per square meter. See the "Forms Design Reference Guide for the IBM 3800 Printing Subsystem", GA26-1633, for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, print line adjustment is by electronically moving the line. First print position can move to the right 5.7 inches (compatibility mode only), but will cause an equivalent number of positions at the right end to be moved beyond the above defined print line boundaries.

It is recommended that printing not occur within 0.100 inch of any binder holes or corner cuts within the form.

Publications: The following publications are for the model 8 and are in addition to those available for the model 3: GA32-0065, GA32-0055, GA26-1633.

SPECIFY

- Power (AC, 3-phase):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
230V #2827	220V #2800
235V or	230V #9905
240V #2818	240V #9915
380V #2816	
400V #2825	
408V #2819	
415V #2826	

- Color (for end cover only, machine color is cloud white): #9041 for red, #9042 for yellow, #9043 for blue, or #9045 for gray.

- Machine Nomenclature:

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931

- Paper Sizes: #2741 - Common Use; #2742 - ISO

Common Use Paper Sizes (#2741); enables the 3800 to process the following forms depths and widths:

Five Forms Depths (in inches): 3-1/2, 5-1/2, 7, 8-1/2, 11
Ten Forms Widths (in inches, edge to edge): 6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3 14-7/8

Limitations: Cannot be installed with ISO Paper Sizes (#2742) Maximum: One. Field Installation: RPQ only.

ISO Paper Sizes (#2742): Enables the 3800 to process the following forms depths and widths:

Six Forms Depths (in inches): 3, 4, 6, 8, 10, 12 (in mm): 76.2, 101.6, 152.4, 203.2, 254.0, 304.8
Thirteen Forms Widths (in mm, edge to edge): 165, 180, 215, 235, 250, 270, 280, 305, 322, 340, 363, 375, 378

MACHINES

Limitations: Cannot be installed with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: RPQ only.

● Tool Kit for model 8:

For rental or Term Lease (ICC) customer, select one:

1. First 3800 (model 1, 2 or 8) ordered, specify #9330 when ordering a model 8.
2. If unit ordered is second or higher 3800 model 8 to be installed, no additional tool kit is required.
3. If a 3800 model 1 or 2 is installed and a model 8 is ordered to supplement or replace the model 1 or 2, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 8.
4. If 3800 model 1 or 2 is being field converted to a model 8, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 8.
5. If required for a multiple machine installation, because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

For purchase customer, select one:

1. For each new purchase 3800 model 8, specify #9330.
2. When Rental 3800 model 8's are purchased, a tool kit (#9330) is to be ordered on a no-charge MES for each machine.
3. When a purchased model 1 or 2 is being field converted to a model 8, specify #9331 (Special Tool Group) which will bring the existing tool kit up to the level required for the model 8.

Note: A Tool Kit (#9220) is required with Burster-Trimmed-Stacker (#1490); see #1490 below.

SPECIAL FEATURES

Accumulator (#1010): The accumulator is used to generate complex pages that require more characters than can be held in raster pattern storage. The page can be viewed as having been created in layers (each layer associated with a group of character sets or images). The layers are "accumulated" until the complex page is complete. Images which are too large for raster pattern storage are placed in the accumulator for printing. This feature provides 768K bytes of storage which will hold data for up to 106 square inches of image. Maximum: One. Field Installation: Yes.

Accumulator Expansion (#1021): This feature adds 256K bytes of storage to the Accumulator (#1010) for a total of 1024K bytes which will hold data for up to 142 square inches of image. For use with Common Use Paper Sizes (#2741). Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2741.

Accumulator Expansion, ISO (#1022): This feature adds 512K bytes of storage to the Accumulator (#1010) for a total of 1280K bytes which will hold data for up to 178 square inches of image. This is

only for machines that have ISO Paper Sizes (#2742) and allows printing of the largest image possible on the maximum ISO paper size. Maximum: One. Field Installation: Yes. Prerequisites: #1010 and #2742.

Burster-Trimmed-Stacker (#1490): Provides an additional output stacking method. Bursts the five Common Use forms lengths or the six ISO lengths to individual sheets and stacks sheets sequentially. Also trims left and right 0.5 inch carrier strip from output sheet. Maximum: One. Field Installation: Yes. Prerequisites: #9220. For rental customer specify #9220 for first Burster-Trimmed-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES. For purchase customer specify #9220 on each Burster-Trimmed-Stacker feature order. When installed Burster-Trimmed-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

Raster Pattern Storage, Add'l (#5410): Base machine comes with 256K bytes, storage maximum is 512K bytes in one additional storage increment of 256K bytes. Provides storage for multiple character sets and can be used to hold small images. Maximum: One. Field Installation: Yes.

Remote Switch Attachment (#8158): To attach the Two-Channel Switch (#8180) to a configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8180.

Two-Channel Switch (#8180): To attach the 3800 to two S/370, 30XX, or 4300 Processor channels which may be on the same CPU or on two different CPUs. On the model 1 both interfaces must have the same device address. The model 8 can have different addresses. The two-channel switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. Maximum: One. Field Installation: Yes.

Dynamic Two-Channel Switch (#8181): Provides the additional capability of an automatic two channel switch. The switch is designed to furnish symmetric two processor support for tightly coupled multiprocessor systems and to attach to two channels from a single CPU to provide alternate path capability. For either tightly coupled multiprocessors or single CPU attachments, data transfer occurs only one channel path at a time. Maximum: One. Field Installation: Yes. Prerequisites: #8180.

MODEL CONVERSION

3800 model 1s or 2s which are purchased or under an ICC Term Lease can be converted to a model 8 by MES. Conversion from a 3800 model 8 to a 3800 model 1 or 2 is not available.

Contact your country DP Supplies Coordinator.

3803 TAPE CONTROL MODEL 1

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

Control unit for 3420 Magnetic Tape Units models 3, 5, 7 for S/370 (except models 115 and 125) 1, 30XX, and 4300 processors.

MODEL 1

Model 1 001

Limitations: Attachable to all S/370 1, 30XX, 4300, and 9375, 9377 processors except S/370 mdl 115 and 125. S/370 mdl 135, 135-3 and 138 are not supported on byte multiplexer channel for concurrent operation with Integrated File Adapter, Integrated Communications Adapter, Selector Channel on 3135-3, 3138.

When attached to a S/360 mdl 30, operating in compatibility mode:

- Two-channel Switch (#8100) is not supported.
- 3420/1400 compatibility #9750 must be specified for the S/360 mdl 30.

These limitations do not apply when the S/360 mdl 30 is operating in native mode for I/O operations; for example, under CS/30.

Attachable to 4300 processors. For considerations, see "4331 Channel Characteristics, GA33-1527 (Mdl Group 1), GA33-1535 (Mdl Group 2), GA33-1550 (Mdl Group 11) or GA33-1567 (4361). Note: 3803 cannot be attached to a byte multiplexer channel on the 4341 Processor.

3420 mdls 4, 6 or 8 cannot be addressed through a 3803 mdl 1.

Prerequisites: A control unit position on a S/370 1, 30XX, 4300, or 9375, 9377 processor channel or Tape-to-printing Subsystem feature (#7810) on a 3800 Printing Subsystem. When used with a 3800 with feature #7810, at least one path, which may be switchable, must be provided to a S/370 or 4300 processor. When multiple control units (up to eight are allowable) are connected to a 3800, all other than one must have power sequencing and control connection provided by a system.

For S/360 mdl 30: If the 3803 Tape Control is attached to the 2030 Selector Channel via the 1400 Magnetic Tape Compatibility feature (#4468), the 3420/1400 Compatibility (#9750) is required on the 2030.

HIGHLIGHTS

- Single channel control for up to eight 3420 tape units
- Through special switching features, up to 16 tape drives can be addressed through any of four 3803 control units.
- Features are offered to provide performance at 556 and 800 bpi in the 7-track NRZI format or at 800 bpi in the 9-track NRZI format or at 1600 bpi phase encoded.

The following table indicates feature numbers for corresponding functions:

Subsystem Function	Feature Name	3420 Tape Unit	3803 Control Unit
1600 bpi PE 9-track only	Single Density	#6631	#9570
1600			

bpi PE/800 NRZI 9-track	Dual Density	#3550	#3551
1600 bpi PE/800 NRZI 7-track	Seven-track	#6407*	#6408

* Tape unit will only read or write 7-track tape.

Publications: S/370 -- GC20-0001

SPECIFY

- Power (AC, 3-phase):**

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	
- Color:** #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.
- Machine Nomenclature:** #2927 for English, #2928 for French, #2929 for German.
- Tape Type:** Either Dual Density (#3551) or Seven-track (#6408) must be ordered unless Single Density (#9570) is specified. Only one of the three features may be installed.
- Tape Switching:** If a tape switching configuration is being ordered, the 3803 must be equipped with a Communicator 1-2, #9071, for a control unit with the 2-control Switch (#1792), 3-control Switch (#1793), or 4-control Switch (#1794). Communicator 3-4 (#9073) for a control unit included in a 3x16 or 4x16 switching configuration which does not have features #1792, #1793 or #1794. If a Communicator feature is ordered for a 3803 without a switching feature, no tape units can be attached to that control unit. See "Tape Switching".

SPECIAL FEATURES

Dual Density (#3551): Provides for attachment of tape units equipped with Dual Density (#3550) to read and write tapes at either 1600 bpi PE or 800 bpi NRZI 9-track. Tape units equipped with Single Density (#6631) can also be attached. Limitations: Cannot be installed in the same control unit with either Single Density (#9570) or Seven-track (#6408). Field Installation: Yes.

Remote Switch Attachment (#6148): Provides for remote operation of the Two-channel Switch (#8100) on the 3803 mdl 1 from a remote console such as the configuration control panel (3058 or 3068) for a S/370 mdl 158MP or 168MP. Operation of the switch on the remote console will result in the same function as operation of the 3803 switch. The 3803 switches will be functionally inoperative when this feature is installed. The cable to the remote console is not provided by this feature. The cable used must contain three wires for each Enable/Disable switch to be installed. Each line must have a total loop resistance of less than 75 ohms when the remote switch completes the path. For operation with the 3058 or 3068, cable P/N 5351178 is required and should be ordered on a separate MES. Field Installation: Yes.

Seven-track (#6408): Provides for attachment of tape units equipped with Seven-track (#6407) to read and write tapes at either 556 or 800 bpi in the 7-track format compatible with tapes written by 729, 7330,

7335, and 2400 series tape units equipped with 7-track read/write heads. Includes the translator function which, when used, causes 8-bit bytes from the I/O interface to be written on tape as 6-bit BCD characters and 6-bit BCD characters read from tape to be translated into their EBCDIC equivalents. The Data Conversion function, also included, allows reading and writing of 8-bit bytes on 7-track tape by converting four tape characters into three storage bytes and vice versa. Tape units equipped with Single Density (#6631) can also be attached. Limitations: Cannot be installed in the same control unit with either Single Density (#9570) or Dual Density (#3551). Tape units operating in 1600 bpi PE mode can also be attached. Field installation: Yes.

Two-channel Switch (#8100): Permits connection of the 3803 Tape Control to a second channel. Alternate path switching between two channels on the same system is under program control. Partitioning of attached tape units between channels on two different systems can be done using current procedures for logical device partitioning. These procedures involve the proper use of the operator commands, VARY ON/VARY OFF (OS) or DVCDN/DVCUP (DOS). Further information concerning this type of operation is contained in the 3803/3420 Sales and Systems Guide, ZZ20-2254. Field installation: Yes.

Tape Switching: Switching configurations, via two, three or four control units, are available to provide access to:

- Up to eight tape units attached to a single control unit;
- Up to 16 tape units, with eight attached to each of two control units.

All switchable tape units must be attached to the control units equipped with the switching features (2-control Switch, 3-control Switch or 4-control Switch). Each control unit must be equipped with the appropriate Single Density, Dual Density, or Seven-track feature for any any drive in the pool to which it has access.

The table below indicates features required for the available switching options.

Switching Options	Features Required	Feature Numbers	
		On 1st 3803	On 2nd 3803
2 x 8	Communicator 1-2	#9071	#9071
	2-Control Switch	#1792	----
3 x 8	Communicator 1-2	#9071	#9071
	3-Control Switch	#1793	----
4 x 8	Communicator 1-2	#9071	#9071
	4-Control Switch	#1794	----
2 x 16	Communicator 1-2	#9071	#9071
	2-Control Switch	#1792	#1792
3 x 16	Communicator 1-2	#9071	#9071
	Communicator 3-4	----	----
	3-Control Switch	#1793	#1793
4 x 16	Communicator 1-2	#9071	#9071
	Communicator 3-4	----	----
	4-Control Switch	#1794	#1794

Switching Options	Features Required	Feature Numbers	
		On 3rd 3803	On 4th 3803
2 x 8	Communicator 1-2	----	----
	2-Control Switch	----	----
3 x 8	Communicator 1-2	#9071	----
	3-Control Switch	----	----
4 x 8	Communicator 1-2	#9071	#9071
	4-Control Switch	----	----
2 x 16	Communicator 1-2	----	----
	2-Control Switch	----	----
3 x 16	Communicator 1-2	----	----

4 x 16	Communicator 3-4	#9073	----
	3-Control Switch	----	----
	Communicator 1-2	----	----
	Communicator 3-4	#9073	#9073
	4-Control Switch	----	----

Note: For assistance in ordering, refer to "Subsystem Description Manual", GA32-0020 or GA32-0021, for graphic presentation of switching configurations.

3420/3803 Attachment Possibilities

Notes:

- All 3803s, irrespective of feature mix, can control tape drives operating in 1600 bpi PE mode.
- No 3803 can have the capability to control tape drives with nine-track NRZI features and tape drives with seven-track NRZI features.
- It is not possible to have more than one of the feature numbers listed in the following table in any one unit (3803 or 3420).

3420 mdl's 3, 5 & 7	3803 w/ Single Density	3803 w/Dual Density	3803 w/ Seven- Track (#6408)
Features	(#9570)	(#3551)	
#6631 Single Density 1600 bpi PE	Yes	Yes	Yes
#3550 Double Density operating in 1600 bpi PE mode	Yes	Yes	Yes
#3550 Double Density operating in 800 bpi NRZI mode	No	Yes	No
#6407 7-Track 556 or 800 bpi NRZI	No	No	Yes

MODEL CONVERSIONS

A 3803 model 1 may be converted to a 3803 model 2 in the field. If the 9-track NRZI feature is installed, it will be removed when the 3803 model 1 is converted to a model 2.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3803 TAPE CONTROL MODEL 2

PURPOSE

Control unit for 3420 Magnetic Tape Units models 3 through 8 for S/370 (except models 115 and 125), 30XX, and 4300 processors.

MODEL 2

Model 2 002

- Prerequisites:** Control unit position on S/370, 30XX, 4300, or 9375, 9377 processor channel or Tape-To-Printing Subsystem feature (#7810) on a 3800 Printing Subsystem. When used with a 3800 with feature #7810, at least one path, which may be switchable, must be provided to a S/360, S/370 or 4300 processor. When multiple control units (up to 8 are allowable) are connected to a 3800, all other than one must have power sequencing and control connection provided by a system. If attached to a 2860, a 3803 Mdl 2 Attachment (#7850) is required on each channel to which 3803 mdl 2s are attached. For #7850, specify #9181 for the first channel of a 2860, #9182 for the second channel, #9183 for the third channel. See M2860 pages.

HIGHLIGHTS

- Standard control unit provides 6250 and 1600 bpi densities.
- 6250 Encoding/Checking Logic allows error correction without stopping or interrupting the read/write operation for any single track or combinations of two tracks simultaneously. Errors may be corrected in all nine tracks of a single data block providing they occur in combinations of no more than two tracks at a time. Long tape blocks are subdivided by resync bursts which are inserted within the block to allow error tracks to return to full operation when reading forward, thereby restoring maximum error correction capability.
- Optional features provide 9-track (800 bpi) NRZI, or 9-track (800 bpi) NRZI with 7-track (800, 556, 200 bpi) NRZI formats.
- Nine-track NRZI with Seven-Track NRZI features permit mixing 9- and 7-track tape units on the same 3803 mdl 2.

The following table indicates features for corresponding functions:

Subsystem	Control Unit 3803 mdl 2		Tape Unit 3420-	Unit 3420-
Density	Feat. Name	Feat. No.	3,5,7 Feat No.	4,6,8 Feat No.
9T-6250	---	Std.	N/A	#6420
9T-6250+1600	---	Std.	N/A	#6425
9T-6250+1600 +800	9-Trck NRZI	#5310	#3550	N/A
9T-6250+1600 +800 with 7T -800-556-200	7-Trck NRZI	#6320	#6407	N/A

* Requires #5310.

- A pool of up to 16 tape units may be switched between 2, 3 or 4 control units.
- A 3803, via a two-channel switch, connects to two channels of the same system or two channels of different systems.

- In 50 Hz, a 3803 mdl 2 provides signal and power attachment for up to eight 3420 mdls 3, 4, 5, 6, 7 and 8.
- In 60 Hz, 3420s may be attached as described under "Limitations".

System Attachment: The 3803 mdl 2 attaches to S/370, 30XX, or 4300 processor via the indicated channels:

* With or without Block Multiplexer Channel (#1421).
 Note 1: Not attachable to Mdl Group 1

Limitations: (1) 3803 mdl 2 attachment to S/370 mdls 135, 135-3, 138, 145, 145-3 and 148 is configuration-sensitive because of potential system overrun. Consult System/370 Model 135 Channel Characteristics (GA33-3010) or System/370 Model 145 Channel Characteristics (GA24-3573). (2) The 3803 mdl 2 is not supported for attachment to byte multiplexer, multiplexer, or 2870 selector sub-channels. (3) The 3803 mdl 2 operating with 3420 mdl 8s is limited to a maximum channel-to-control unit (total x dimension) cable length of 119 feet to the 2880 or selector channel of a S/370 mdl 145, 119 feet to the block multiplexer channel of a S/370 mdl 145-3 or 148, 103 feet to the block multiplexer channel of a S/370 mdl 155, 3032 or 3033, and 72 feet to a 2860 or 3092. (4) The 3803 mdl 2 provides power and signal connections for 3420 tape drives. Up to eight drives of any mdl can be signal-connected to a 3803 mdl 2. Note that 3420 mdls 4, 6 and 8 must signal-connect to a 3803 mdl 2. In 50 Hz, one 3803 (either mdl 1 or mdl 2) provides power for up to eight 3420 mdls 3, 4, 5, 6, 7 and 8. In 60 Hz, when the tape subsystem includes 3420 mdl 8s, one 3803 (mdl 1 or mdl 2) may power a maximum of six 3420 mdl 8s or combinations of drives as listed in the table below. (5) For 4331 considerations see the "4331 Channel Characteristics".

GA33-1527 (Mdl Group 1), GA33-1535 (Mdl Group 2) or GA33-1550 (Mdl Group 11).

The maximum number of drives which may be powered from one 3803 without #9001 (Auxiliary AC Power Supply) are listed below.

Number of 3420 Mdl 8s	and	Number of 3420 Mdl 7s	and	Number of 3420 Mdls 3-6
6		0		0
5		1		0
5		0		2
4		2		1

2		0		6
1		*		*

* If only one 3420 mdl 8, then any combination of seven additional tape units is permissible.

When the subsystem includes more than one 60 Hz 3803 mdl 2 and the number of tape drives which must be signal-connected to a control unit exceeds the maximum number of drives which may be powered from one 3803 (see table above), obtain power from another control unit using a separate power cable (Group 145). Separate signal cable (Group 144) is also available. In 60 Hz, a power supply feature (#9001) is available(not required for 50 Hz units), which allows eight 3420s of any mdl to be powered from one 60 Hz 3803 mdl 2. See "Specify". This feature is necessary only if: (1) The subsystem includes only one 60 Hz 3803 mdl 2 and the drives to be powered from it exceed the maximum specified in the table above, or (2) The power load still exceeds the table limitations for a 60 Hz 3803 when distribution by re-cabling with separate power and signal cables has been considered.

Bibliography: GC20-0001

SPECIFY

- Power (AC, 3-phase): Must be consistent with system voltage.

50 Hz	60 Hz (4-wire)
200V #2807	208V #9903
220V #2815	230V #9905
235V #2818	
380V #2816	
408V #2819	

- Color: #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, #9046 for white.

- Machine Nomenclature:

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931

- Density: 6250 and 1600 bpi are standard and do not need to be specified. In addition, order Nine-Track NRZI (#5310) or Seven-Track NRZI (#6320) if required. See "Special Features".

- Tape Switching: If a tape-switching configuration is being ordered, the 3803 must be equipped with a Communicator (#9071 or #9073). See table under "Tape Switching" below. If

a Communicator feature is ordered for a 3803 without a switching feature, no tape units can be signal-attached to that control unit.

- On 60 Hz units only:
- Auxiliary AC Power Supply: #9001. Required to power more than six 3420 mdl 8s from one 3803 mdl 2. #9001 is neither required nor available on 50 Hz units. Also may be required to power 3420 mdl 8s in combination with other drives. See "Limitations" above. Requires 100 ampere power source.

SPECIAL FEATURES

Nine-Track NRZI (#5310): Required for the attachment of 3420 mdls 3, 5 or 7 equipped with Dual Density (#3550). Allows attached tape drives to read and write data in a 9-track 800 bpi format as well as 1600 bpi (Phase Encoded) format. Field Installation: Yes.

Remote Switch Attachment (#6148): Provides for remote operation of the Two-Channel Switch (#8100) on the 3803 mdl 2 from a remote console such as the configuration control panel (3058 or 3068) for a S/370 mdl 158MP or 168MP. Operation of the switch on the remote console will result in the same function as operation of the 3803 switch. The 3803 switches will be functionally inoperative when this feature is installed. The cable to the remote console is not provided by this feature. The cable used must contain three wires for each Enable/Disable switch to be installed. Each line must have a total loop resistance of less than 75 ohms when the remote switch completes the path. For operation with the 3058 or 3068, cable P/N 5351178 is required and should be ordered on a separate MES. Field Installation: Yes.

Seven-Track NRZI (#6320): Required for the attachment of 3420 mdls 3, 5 or 7 equipped with Seven-Track (#6407). Allows attached tape drives to read and write data in 7-track/200, 556 or 800 bpi format. Prerequisites: #5310. Field Installation: Yes.

Two-Channel Switch (#8100): Permits connection of the 3803 to a second channel. Alternate path switching between two channels on the same system is under program control. Partitioning of attached tape units between channels on two different systems can be done using current procedures for logical device partitioning. The procedures involve the proper use of the operator commands, VARY ONLINE/VARY OFFLINE (OS) or DVCDN/DVCUP (DOS). Field Installation: Yes.

Tape Switching (#1792-#1794): Switching configurations, via two, three or four control units are available to provide access to:

- Up to eight tape units attached to a single control unit.
- Up to 16 tape units, with eight attached to each of two control units.

All switchable tape units must be signal-attached to the control units equipped with the switching features (2-Control Switch, 3-Control Switch or 4-Control Switch). Each control unit must be equipped with the appropriate density feature for any drive in the pool to which it has access. Field Installation: Yes.

The following table indicates features required for the available switching options.

Switching Features		Feature Numbers	
Options	Required	On 1st 3803	On 2nd 3803
2 x 8	Communicator 1-2	#9071	#9071
	2-Control Switch	#1792	----
3 x 8	Communicator 1-2	#9071	#9071
	3-Control Switch	#1793	----
4 x 8	Communicator 1-2	#9071	#9071
	4-Control Switch	#1794	----
2 x 16	Communicator 1-2	#9071	#9071

MACHINES

	2-Control Switch	#1792	#1792
3 x 16	Communicator 1-2	#9071	#9071
	Communicator 3-4	----	----
	3-Control Switch	#1793	#1793
4 x 16	Communicator 1-2	#9071	#9071
	Communicator 3-4	----	----
	4-Control Switch	#1794	#1794

	2-Control Switch	----	----
3 x 16	Communicator 1-2	----	----
	Communicator 3-4	#9073	----
	3-Control Switch	----	----
4 x 16	Communicator 1-2	----	----
	Communicator 3-4	#9073	#9073
	4-Control Switch	----	----

Note: For assistance in ordering, refer to Subsystem Description Manual, GA32-0020 or GA32-0021, for graphic presentation of switching configurations.

Switching Options	Features Required	Feature Numbers	
		On 3rd 3803	On 4th 3803
2 x 8	Communicator 1-2	----	----
	2-Control Switch	----	----
3 x 8	Communicator 1-2	#9071	----
	3-Control Switch	----	----
4 x 8	Communicator 1-2	#9071	#9071
	4-Control Switch	----	----
2 x 16	Communicator 1-2	----	----

MODEL CONVERSIONS

A 3803 model 1 may be converted to a 3803 model 2 in the field.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3812 PAGEPRINTER

PURPOSE

The Pageprinter (3812) is a low-priced, multifunction, non-impact page printer of table-top design. It provides letter-quality text and all points addressable graphics prints at a maximum speed of 12 pages/minute and is designed to produce up to 18,000 pages per month.

MODELS

Model 1 001

Model 2 002

Customer Setup (CSU): The 3812 is designated as a customer setup machine thereby offering the customer early availability and relocation flexibility. Setup procedures for the customer will be shipped with each machine. The Marketing Representative must advise the customer of his responsibilities before receipt of the machine. For additional information on CSU, refer to GI section.

HIGHLIGHTS

- The 3812 uses a light emitting diode (LED) printhead and produces single-sided printed output at up to 12-pages per minute for letter size and up to 9.6-pages per minute for legal size, face down in sequential order in the output tray which can hold up to 550 sheets of 20-pound paper. The jobs in the output tray may be offset under program control.
- The 3812 can attach to PCs, S/36-S/38 or VM, but not concurrently. Cables, cards and diskettes will have to be changed to support the desired environment. This change can be made after installation on the customer's existing 3812 by the customer. The customer will need to order from IBM (at an additional cost) the appropriate feature to adapt the 3812 to the new environment (i.e., feature #3015-S/36 Attachment). See "Special Features" for appropriate feature and part number.
- An RS-422 attachment is also included.
- The 3812 is directly attached to the IBM PC, PC/XT, PC/AT, 3270-PC (Native DOS mode only), 3270 Personal Computer AT, IBM Personal System/2, RT PC, and PC Portable via the RS-232-C asynchronous port. Modem attachment of the 3812 to these PCs and the RT PC is not supported.
- The 3812 can be attached to 1 IBM Personal Computer on a stand-alone basis or to up to 8 IBM Personal Computers via an optional Sharing Card, or to multiple IBM Personal Computers via the IBM PC Network or the IBM Token-Ring Network. The Sharing Card does not support 3270 Control Program, 3270 Emulation Program/RT PC.
- VM attachment is provided via an IBM 3705/3725 control unit or 4331 and 4361 ICA, or 9370 Telecommunications Subsystem using an RS-232-C BSC line, the 3812 Bisync Communications feature (#3060) and the required Pageprinter (3812) VM Support Program Offering (5798-DTE). This attachment does not support vector graphics capability.
- Direct attachment (5219 emulation) to the System/36, System/36 PC, System/38 and to the 5294 communicating to System/36 or System/38, is provided via the System/36 and System/38 Attachment Feature. 5219 emulation does not support image, vector graphics, or Enhanced Support capabilities of the Pageprinter.
- Provides letter-quality printing at up to 12 pages per minute (maximum). (This will vary depending on the application.)
- Will print combined text and graphics.
- Print resolution of 240 x 240 dots per inch.
- All points addressable graphics.
- Supports Vector Graphics.
- LED (Light Emitting Diode) printhead technology (no moving parts).
- Basic paper handling includes two input cassettes (550 pages and 250 pages of 20-lb. paper); A4, B5, executive, legal and letter cut-sheet paper, letterhead. Gummed labels are also supported via the secondary cassette only.
- Direct attachment to the IBM PC, PC/XT, PC/AT, RT PC with software and hardware consideration, 3270 Personal Computer AT, 3270-PC and PC Portable via the RS-232-C port.
- Multiple PCs may be attached via the PC network and the IBM Token-Ring Network.
- Attachment to the System/36, System/38 or the 5294 communicating to a System/36 and System/38 (5219 emulation). Attachment to the System/36-PC is supported under Release 5 of S/36 SSP.
- Zero, 90, 180, and 270 degree print orientations standard.
- Audible alarm when operator intervention required.
- UP to 62 fonts shipped standard with printer, including up to 8 typographic fonts.
- Operator-replaceable supplies (toner, photoconductor, developer, fuser).
- Sequential, face-down, program-controlled offset output (up to 550 pages).
- Quiet operation; up to 48 dBA (standby), up to 56 dBA (operational).
- No usage charge.
- Self diagnostics.
- Oversize and special characters, logos, and business graphics.
- 1.2M byte removable diskette containing microcode, diagnostics, and fonts in the PC environment with the exception of the RT PC.
- Enhanced Support (included in the Model 2 and not applicable to the System/36/System/38 Attachment (#3015) unless the IPDS feature (#3192) is installed.)

HIGHLIGHTS OF ENHANCED SUPPORT

Characters that are only partially on the page will print partially on the page.

For printing long jobs, a new PMP command allows the IBM Pageprinter 3812 to select paper from the cassette with paper. Known as the "Set Device Mode". Each time a Print Page command is executed, the paper drawer selected by the Print Page command is examined. If the drawer is empty, paper is fed from the other drawer instead. An out-of-paper occurs if both drawers are empty. The exit tray of the printer holds approximately 550 sheets, which is also the number of sheets in the primary drawer. Therefore, using this function may result in a "remove prints" indication before both the primary and alternate cassettes are empty.

If unprinted data remains in the 3812 printer memory for more than three seconds, the Job In Process (JIP) light on the printer operator panel will begin flashing. If the 3812 Start key is pressed while the JIP light is flashing, the page-in-printer memory will be printed and the memory erased. This new feature is useful when an application program fails to provide a form feed command at the end of a print job.

A dynamic in-printer-memory font index is created each time the 3812 is powered on, or whenever the 3812 operational diskette is changed. This may improve printer performance by reducing the time required to locate a font on the operational diskette. Enhanced 3812 Support for 3812s attached to PC, PC/XT, PC/AT, and RT PC provides image decompression. MMR compression is the name given to the compression algorithm specified by the 2-dimensional CCITT draft recommendation T.4, where the number of two-dimensionally encoded rows between each 1-dimensionally encoded row is infinite.

Physical Specifications:

• Size Dimensions:

Length: 68cm (27 in.)
Depth: 48cm (19 in.)
Height: 38cm (15 in.)

- Dimensions with Cassettes:
 - Length: 122cm (48 in.)
 - Weight:
 - 61.9kg (134 lbs.) without cassettes
 - 66kg (145 lbs.) with cassettes
- Throughput:
 - Up to 12 pages/minute for letter size
 - Up to 9.6 pages/minute for legal size
- Usage: Up to 18,000 pages/month
- Paper weights: 60 - 90gm/sq.m cut-sheet (16 - 24 pound)
- Cut-sheet sizes (inches):
 - JIS B5 - 182 x 257mm (7.2 x 10.1 in.)
 - Executive:
 - 178 x 267mm (7.0 x 10.5 in.)
 - 184 x 267mm (7.25 x 10.5 in.)
 - 190 x 268mm (7.5 x 10.5 in.)
 - Letter - 216 x 279mm (8.5 x 11.0 in.)
 - ISO/JIS A4 - 210 x 297mm (8.3 x 11.7 in.)
 - Legal - 216 x 356mm (8.5 x 14.0 in.)
- Input capacities: (75gm/sq.m, 20 lb.)
 - Primary 550-page cassette
 - Secondary 250-page cassette
- Special input types: Gummed labels, letterhead.
- Output capacity: 550 pages, sequenced, offset (20 lb.)(75gm/sq.m).
- Print quality: Letter quality.
- Graphics resolution: 240 x 240 dots per inch.
- Imaging tolerances: 1.5mm registration.
- Acoustics: up to 56 dBa (operation); up to 48 dBa (standby)

Operating Environment: IBM Class B, defined as:

Temperature: 15.6 - 32.2C (60 - 90F)
 Relative Humidity: 8 - 80 percent
 Wet Bulb Temperature: 0.6 - 29.4C (33 - 85F)
 Altitude: 0 - 2,135m (0 - 7,000 ft)

Certification:

IEC 435 - Certified Canadian CSA
 IEC 380 - Certified Canadian CSA
 VDE 871 - Certified by VDE

AAS Ordering Instructions: The 3812 is a system component.

Ordering Information: The country requirement is determined by the 3-digit country code. The following standard items are shipped with the printer and need no specification:

- Ship group publications.
- Power cords.
- Two paper cassettes (one primary, one secondary).
- One toner cartridge.
- One photoconductor unit.
- One developer unit.
- One fuser unit.
- One exit tray.
- One diskette (containing the Pageprinter microcode and the Pageprinter fonts).
- One diskette (containing PC Aid Program).
- Operator information labels.
- Any optional features ordered will be included with the printer in separate overpacks.

Customer Responsibilities: The customer is responsible for:

1. Ordering appropriate cables and attachment features.

2. Adequate site, system and other preparation as described in "Installation and Planning Guide", G544-3265.
3. Physical setup, connection of cables and checkout.
4. Following the documented cleaning procedures; using and following the problem-determination procedures prior to calling "Service".

Note: Phone assistance is available to assist customers with fulfilling customers' responsibilities.

(Canada only> For 3812s purchased from IBM, call 1-800-IBM-7378.<)

For 3812s purchased from Authorized IBM Dealers, contact your point of sale.

5. Ordering and replacing those items specified as "supplies," namely toner, photoconductor unit, developer unit, and fuser unit.
6. Contacting National Service Division to make cable connection of IBM CSU units to IBM non-CSU units where customer-access areas are not provided.

Customer should normally stock at least one extra unit of each supply at all times for problem determination procedure exchanges, unless they decide that one set can be used for determination procedures on multiple 3812 installations.

Note: CSU assistance is available from National Service Division at the current hourly service rates and terms. CSU assistance does not include the installations of supplies, which is a customer responsibility.

Publications: Publications language "Bill of Materials" provide with one part number, one of each manual for that language plus a binder and binder sleeve for the Guide To Operations.

Language	Bill of Material
Canadian French	1686381
US English	1686372

Vinyl Slipcase - P/N 1686485

Paper Handling: Legal-, letter-, A4-, B5-, and executive-size paper from 178 x 267mm to 216 x 356mm (7.0 x 10.5 in. to 8.5 x 14.0 in.) may be fed under program control from either of the two input cassettes. Paper weights from 60 - 90gm/sq.m (16 to 24 lbs.) may be used. Xerographic paper is recommended.

Gummed labels can be automatically fed from the secondary paper cassette. The primary paper cassette holds 550 sheets of 75gm/sq.m (20-lb.) paper; the secondary paper cassette holds up to 250 sheets of 20-lb. paper. The output tray holds 550 sheets of 20-lb. paper. The output tray may be jogged one-half inch between jobs under program control. The output is delivered face-down, in sequential order.

When using gummed labels, no more than 30 label sheets should be placed in the alternate cassette.

Relative Humidity Effects on Paper Handling: When the Pageprinter is operating in environments where the relative humidity is above 65 percent, print quality and paper handling may be degraded when paper is left in the cassette for extended periods of time (12 hours or more).

When the relative humidity is in the area of 8 - 15 percent, paper handling is also affected due to static electric attraction in the exit tray and input cassette. Leaving paper in the cassette helps to correct this situation.

An optional Heated Cassette Kit (#3070) is available (at a charge) if relative humidity is causing significant paper handling problem.

Performance: The 3812 prints at speeds of up to 12 pages per minute for letter size pages, and up to 9.6 pages per minute for legal size pages. Actual speed can be significantly affected by the application and host programming support. (See "Forms Design Reference Guide for Printers", GA31-3488, for forms-design considerations.)

Fonts, Graphics and Special Characters: The 3812 will print the 5152 data stream of characters, logos, and business graphics for existing programs written for the 5152-2.

Standard Operational Diskette: One US diskette will be shipped with the 3812. The country that orders the 3812 will determine if any additional diskettes (US, Language Group 1, 2, or 4) will be shipped with the Pageprinter. These must be specified on the order. Fonts contained on each of the four diskettes are listed below.

Additional programming on the Personal Computer may be required to take advantage of the non-5152 emulation fonts.

The PC-ASCII diskettes are:

US - Latin
Language Group 1 - Nordic, Icelandic, Portuguese and Latin
Language Group 2 - Arabic and Latin
Language Group 4 - Hebrew and Latin

Pageprinter Fonts with an asterisk (*) following, contain international character sets of 221 printable characters (Code Page 850), while the other Latin fonts contain a subset of the international character set.

BSC Feature Operational Diskette: Diskette shipped with the Bisync Communications feature contains all the fonts listed above. When the Pageprinter is used with "VM3812 -- 3812 VM Support" (5798-DTE), fonts are part of that program offering. (VM3812 does not use the fonts on the BSC Feature Operational Diskette. See "VM3812 Users Guide" for complete listing of these fonts.) This VM3812 set of fonts contains the same fonts already available on both the 3800 Model 3 and the 3820 Pageprinter. For samples of these fonts, refer to "3800 Model 3 Font Catalog", SH30-0053.

RT PC Feature Operational Diskette: The Pageprinter RT PC Operational Diskette shipped with the RT PC Feature provides the fonts listed below.

Pageprinter Fonts with an asterisk (*) following, contain the full international character sets of 189 characters (Code Page 500), while the other Latin fonts contain a subset of the international character sets.

Notes:

1. The Pageprinter prints the OCR-A and OCR-B fonts with the same high quality as other type styles. IBM has tested these fonts, but IBM does not warrant and has not tested that these characters are readable by all OCR Reading devices. Users of fonts should test read-write compatibility before implementing the Pageprinter for OCR applications.
2. These fonts contain international character sets of 221 printable characters (code page 850), enhanced support (Model 2) diskettes only.
3. The Language Group 1 diskette defaults to the Latin 5152 emulation fonts modified against code page 865 for Model 1 and code page 850 for Model 2.
4. These fonts have data derived under license from the Monotype Corporation PLC.
5. A functional equivalent of Monotype(R) Times New Roman(R), a trademark of the Monotype Corporation PLC. Contains data derived under license from the Monotype Corporation PLC.

The code pages supported are: 037, 259 (Symbols), 273, 274, 275, 277, 278, 280, 281, 282, 284, 285, 297, 340 (OCR), 420 (Arabic), 424 (Hebrew), 500, and 871 (Icelandic). Support of these code pages does not imply that all the graphics in the code page are available in all fonts.

DisplayWrite 3 and Virtual Device Interface Support: The IBM PC Program Product, DisplayWrite 3, Version 1.0, has implemented multiple font selection for the announced 10, 12, and 15 pitch fonts up to a total of 17 different fonts.

The IBM PC Program Product, DisplayWrite 3, Version 1.1 has implemented additional functions to support proportional spaced fonts and offers up to a total of 26 different fonts.

The printer tables (PDTs/PFTs) required for the capabilities contained in DisplayWrite 3 (Versions 1.1); DisplayWrite 4 (Version 1.0) are provided at no charge for those Pageprinters ordered for PC attachment on the "3812 PC Aid" diskette (P/N 1696692), shipped with each printer.

A device driver is provided on the "3812 PC Aid" diskette to allow the Pageprinter to attach to those program products written to the virtual device interface (VDI). (A virtual device interface allows applications to run unchanged on a variety of supported graphic devices.)

Font selection is also provided by the Pageprinter (3812) Driver program offering. The "Pageprinter (3812) Programming Reference", S544-3268, gives further information on font selection techniques.

TECHNICAL INFORMATION

Hardware Requirements

IBM Personal Computer Attachment:

	P/N	Feature
PC with asynch serial adapter card	1502074	#2074
PC/XT with asynch serial adapter card	1502074	#2074
PC/AT with serial/parallel adapter card	6450215	#0215
PC Portable with asynch serial adapter card	1502074	#2074
3270 PC with asynch serial adapter card	1502074	#2074
3270 PC AT with serial/parallel adapter card	6450215	#0215

RT PC with asynch serial adapter with Direct Memory Access standard feature.

Personal System/2 with standard features.

Processors for VM attachment:

370 family (Models 138 through 168)

303X
4321
4331
4341
4361
4381
308X
309X

Controllers: Operable at speeds to 19.2K bps full-duplex or half-duplex nonswitched lines running under EP or PEP.

3705 Communication Controller
3725 Communication Controller
4321 via ICA
4331 via ICA
4361 via ICA

System/36, System/38 and 5294 Attachment: System/36 and System/38 Attachment Feature

- Microcode diskette
- Twinaxial connector module (which provides self-termination and cable through capabilities)

Hardware Compatibility: The 3812 is equipped with an RS-232-C serial interface and is designed to be hardware compatible to the IBM PC, PC/XT, PC/AT, Personal System/2, RT PC, 3270-PC, 3270 Personal Computer AT, and PC Portable. An RS-422 interface is also available on the 3812.

The words "hardware compatible" mean that the host system RS-232-C interface is logically compatible with the 3812 interfaces, and the host system is capable of generating a data stream (i.e., control codes and character codes) which is properly interpreted by the 3812.

Testing of customer applications which involve specific non-IBM personal computers and their related software is the customer's responsibility.

The 3812 when attached to the System/36 or System/38 or 5294 with Feature Code #3015, communicating to the System/36 or System/38, emulates the 5219 printer. All 5219 fonts are supported, however several are simulated. DisplayWrite/36 allows the use of all the Pageprinter 10, 12, and 15 pitch and proportionally spaced fonts. Additional programming using PRPQ P84073 (5799-BYX) "System/36 Printer Applications Program Interface" is required for RPG, COBOL and Assembler programs on the System/36 to make use of all fixed pitch and typographic fonts. The System/38 Office/38 Personal Services/38 provides support for all Pageprinter fixed pitch and proportionally spaced fonts. Typographic fonts may be selected for an entire Personal Services/38 document through use of CL commands. All fixed pitch fonts are available to all other S/38 applications. For more information, see "Using the IBM Pageprinter (3812) with an IBM System/36 or System/38", S544-3343.

The 5219 is a serial printer and does not support image, vector capabilities of the Pageprinter; the 3812 emulating the 5219 does not support image, vector graphics, or Enhanced function capabilities. Some models of the 5219 print envelopes; the 3812 does not. The 5219 can print on continuous forms through use of a forms tractor; the 3812 is a page printer and uses cut-sheet paper or forms. The 5219 allows paper to be rotated in the input trays; the 3812, under program control, electronically rotates the print.

Software Compatibility: The following software products were tested with the 3812. Only a specific level of each software product was tested. Other levels of the same software product may operate differently, and therefore may or may not function properly with the 3812. Proper function of these software products does not imply proper function of any other software product.

The control codes for the 3812 are consistent with those used on the IBM Personal Computer Graphics Printer. This means that much of the software written for use with this printer will function properly with the 3812. The words "function properly" mean that the 3812, using its supported features, in general gives the type of output expected from the software.

Pageprinter/IBM Graphics Printer (5152-2) differences: On the 3812, lines that exceed page width are truncated (no line wrap).

Without the optional 3812 Pageprinter Driver, some applications may require the user to send a form feed to print the last page (reference "IBM Pageprinter (3812) Guide to Operations", S544-3267).

The words "function properly" do not imply that the software takes full advantage of all the features and capabilities of the 3812 (e.g., Vector Graphics and paper tray selections).

Extensive testing was done with each software product listed. Due to the complexity of the software, however, it is unlikely that every case was tested. Therefore, "proper function" refers only to cases tested by IBM on each software product.

The IBM licensed software programs listed below "function properly" with the 3812 when running on properly configured IBM personal computers with the RS-232-C serial asynchronous interface.

Some functions of the 3812 may not be supported by these software offerings (e.g., fonts, images or vector graphics). Additional programming may be required by the user to take advantage of these Pageprinter capabilities.

3812 Support of Advanced Function Printing: Many print files created for the 3820 Page Printer and the 3800 Model 3 Printing Subsystem can be printed without change on the 3812 using the VM3812 Program Offering. (Note: See Program Offering.)

"VM3812 - IBM 3812 Pageprinter VM Support Applications Programmer's Guide", SH20-6732.

Software Requirements: The 3812 operates on IBM Personal Computers with the following:

Operating Systems and Languages:

DOS 2.0 with BASIC
DOS 2.1 with BASIC
DOS 3.0 with BASIC
DOS 3.1 with BASIC

IBM Professional FORTRAN compiler

For 3270 PC, native DOS or under 3270 PC Control Program:

Models	Version	P/N	Feature
2, 4, 6	1	1837434	#1505
2, 4, 6	2	6217355	#3005
24, 26	1.2.2	6423236	#3010

For 3270 Personal Computer AT native DOS or under 3270 Personal Computer AT Control Program, Version 2.1: Models 020, 041, 042, 061, and 062 (P/N 6217355, feature #3005).

Application Packages (tested under DOS 3.1):

PC Network Printserver:

PC Network - PC Network Program
IBM Token-Ring Network - PC Network Program

Application Packages (tested under DOS 2.0 or 2.1):

- DisplayWrite 1 1.0 (as class A printer only)
- DisplayWrite 2 1.1 (as class A printer only)
- DisplayWrite 3 1.0 (as class A and class F printer)
- DisplayWrite 3 1.1 (as class A and class F printer)
- DisplayWrite 4 1.0 (Tested under DOS 2.1 and 3.2)
- Personal Editor 1.0
- Professional Editor 1.0
- Wordproof 1.0
- Script/PC 1.0
- IBM Writing Assistant 1.0
- IBM Filing Assistant 1.0
- IBM Reporting Assistant 1.0
- IBM Graphing Assistant 1.0
- IBM Personal Decision Series:
 - Data Edition 1.0
 - Words Edition 1.0
 - Reports + 1.0
 - Graphs Edition 1.0
 - Plans Edition 1.0
 - Plans + Edition 1.0
 - Data Training Edition 1.0
 - Mailing Labels Edition 1.0
 - Prospect Tracking Edition 1.0
 - Client Time/Cost Accounting Edition 1.0
 - Asset Catalog Edition 1.0
 - Appointment Calendar Edition 1.0
- Diskette Librarian
- IBM Business Management Series:
 - Accounts Payable Edition 1.0
 - Accounts Receivable Edition 1.0
 - General Ledger Edition 1.0
 - Inventory Accounting Edition 1.0
 - Order Entry and Invoicing Edition 1.0
 - Payroll Edition 1.0
- IBM Training Editions:
 - Accounts Payable Edition
 - Accounts Receivable Edition
 - General Ledger Edition
 - Inventory Accounting Edition
 - Order Entry and Invoicing Edition
 - Payroll Edition
- Multiplan 1.1

Software Support: The 3812 has been tested under DOS 2.0 and 2.1 on IBM Personal Computers with the following software offerings. The country offerings tested are shown in parentheses.

- DisplayWrite 1 (FR, GE, IT, SP)
- DisplayWrite 2 (FR, GE, IT, SP, UK, Arabic)
- IBM Homeword (GE, IT, SP, UK, DUT, DAN)
- IBM Filing Assistant (FR, GE, IT, SP, UK)
- IBM Graphing Assistant (FR, GE, IT, SP, UK)
- IBM Planning Assistant (UK)
- IBM Reporting Assistant (FR, GE, IT, SP, UK)
- IBM Writing Assistant (FR, GE, IT, SP, UK)
- IBM Topview (UK, WW)

- IBM PC Network - PC Network Program (GE, IT, SP, UK)
- IBM Basic Primer (FR, IT)
- Exploring the IBM PC Network (FR, GE, IT, SP, UK)
- Exploring the IBM PC Portable (FR, GE, IT, SP, UK)
- Exploring the IBM PC/AT (FR, GE, IT, SP, UK)
- IBM PC Network Program (GE, IT, SP, UK)
- IBM Videotext Terminal Support (UK)
- IBM SNA 3270 Emulation and RJE - National Language Support (UK)
- Multiplan (FR, GE, IT, SP, UK)

Vendor Logo Applications: Listed below are Vendor Logo Program Offerings previously released by IBM. IBM has analyzed these DOS-based programs and determined that in their current form as distributed by IBM, they will print as expected by the 3812. IBM does not guarantee that equivalent results will be obtained from future releases of these programs.

- Easywriter (FR, GE, IT, NL, SP) (note 1)
 - F.T. Moneywise (UK) (note 2)
 - DCA Decision Support Interface (UK) (note 3)
 - Pertmaster 1000 (UK) (note 4)
 - Pertmaster 2500 (UK) (note 4)
 - Torus Tapestry Manager (UK) (note 5)
 - Torus Tapestry Workstation (UK) (note 5)
1. Trademark of Information Unlimited Software, Inc.
 2. Trademark of Moneywise Software Limited.
 3. Trademark of Digital Communications Associates, Inc.
 4. Trademark of Pertmaster Corporation.
 5. Trademark of Torus Corporation.

See additional hardware and software requirements in "Program Offering Support" section.

System/36 and System/38 Attachment Feature: The System/36 and System/38 Attachment Feature (P/N 1348409, Feature #3015) is supported by release 3 System/36 (5360 and 5362), release 5 System/36 (5364) and release 7 System/38 program products.

VM Support: In addition to supporting the IBM PC, PC/XT, PC/AT, 3270-PC, RT PC, 3270 Personal Computer AT, and PC Portable through the RS-232-C serial attachment, VM users may send print output to the IBM Pageprinter via the bisync RS-232-C attachment and the 3812 Pageprinter VM Support program offering. The 3812 Bisync Communications feature (P/N 1348496, #3060) is required.

Applications running under VM such as DCF release 3 and GDDM release 3 or 4 can take advantage of the speed, print quality, and all points addressability of the 3812. This attachment does not support vector graphics capability.

For example, these kinds of files can be printed:

- LIST38PP (DCF Release 3, etc.) - Documents formatted for 3800 and 3820.
- Documents formatted by DCF Release 3 or Interactive Composition and Editing Facility (ICEF/2) for the 4250 and processed by PROOFPRNT Utility.
- Document formatted by ICEF/2 for the 3800 Model 3
- LISTING (CMS Listing Files)
- PRINT (CMS Printer Files)
- PRINT38 (3800 Model 1 Files)
- Drawings generated by GDDM for the 3800 or 3820.
 - GDQF - Graphical Data and Query Facility
 - ICU - Interactive Chart Utility
 - IPG - Interactive Presentation Graphics
 - Composition Utility
- Canonical Images (black and white bit images) created by:
 - GDDM - 240 dpi resolution
 - Scanner
- Electronic overlays can be prepared using Overlay Generation Language (OGL) in MVS and sent to CMS files to be processed by VM3812.
- Documents can be sent to a PC for subsequent printing offline on a 3812.

Communication Facilities: The 3812 operates in half-duplex point-to-point mode on half-duplex or full duplex facilities using

BSC, at a transmission rate of up to 19,200 bps (with a modem supplied clock) on nonswitched facilities.

Modems: Unless the 3812 will be directly connected, an external Data Circuit Terminating Equipment (DCE) is required, (e.g., in the VM environment). The 3812 has been tested to operate with the 3865-2, 5865, 5866, 5811, 5812 modems. (See M2700 pages).

Communication Interfaces: Provides a V.24 interface for attachment to an external IBM modem or PTT mandatory modem complying with CCITT Recommendation V.24, V.28 ISO Standard 2110 and other relevant CCITT Recommendations. Attachment to non-IBM modems or other DCEs is subject to the provision of the Multiple Supplier Systems Bulletin.

Printer Sharing Card: The Printer Sharing Card (P/N 1348408, feature #3115) allows attachment of the 3812 to up to eight PCs (any mix of IBM PC, PC/XT, PC/AT, and PC Portable). The IBM PC/DOS Pageprinter Driver program offering (P/N 6466981, feature #9623) is for use with the Sharing Card as it provides job separators, paper cassette selection, output jogging and font selection. A separate license is required for each personal computer.

For cable specifications and pre-assembled cable sizes, see "Introduction and Planning Guide", G544-3265.

PC Network and IBM Token-Ring Network Environments: A sharing card may not be used in these environments. The 3812 emulates the IBM Graphics Printer (5152-002). Use of the Pageprinter (3812) Driver Program (P/N 6466981, feature #9623) in non-print server workstations will provide menu-driven font selection, paper drawer selection and job separation. The 3812 attaches to a network print server PC, thus providing letter-quality print and graphics support for all network users. See Programming Announcement dated August 14, 1984 for details on PC Network requirements; and Programming Announcement dated October 15, 1985, for IBM Token-Ring Network information.

Program Offering Support: The following Program Offerings will be available at General Availability to support the 3812 Pageprinter:

- IBM PC/DOS 3812 Pageprinter Driver Program (P/N 6466981, #9623), required with PC Sharing Card environments.
 - Allows data rates up to 9.6K bps (19.2K bps on Personal System/2)
 - Automatic background print buffer (when printer online to host)
 - Print option selection via full-screen menu:
 - ▲ Multiple fonts
 - ▲ Different page format options
 - ▲ Status of queued jobs
 - Maintains job boundaries for Sharing Card option.
 - Separate license needed for each PC attached to the sharing card.
 - Operating Environment
 - Runs on IBM PC, PC/XT, PC/AT, PC Portable:
 - ▲ 256Kb Memory minimum
 - ▲ One diskette drive
 - Runs in a shared environment with IBM PC, PC/XT, PC/AT, and PC Portable:
 - ▲ 256Kb memory minimum
 - ▲ One diskette drive
 - Will optionally display 3812 operator messages at the PC.
 - For further information see the Availability Notice, G320-0819
- 3812 Font Managers
 - 3812 Pageprinter VM Support (5798-DTE):
 - Line printer emulation
 - Allows All Points Addressable printing
 - BSC attach.
 - Operating environment:
 - ▲ IBM S/370, 43XX, 303X, 308X, 309X, 937X family of CPUs

- ▲ VM SP3, SP4 or VM/SP-Entry and HPO 3.2 or greater
- ▲ BISYNC up to 19.2K bps
- ▲ 3705/3725 communications control unit
- ▲ 4331, 4361 ICA, 4321
- ▲ 3812 BISYNC Communications feature (P/N 1348496, feature #3060)
- For additional information see Availability Notice G320-0799

Defect Service will be available until December 31, 1987, at which time it will be withdrawn without written notice.

The mailing address for APARs is:

IBM Corporation
IPS Product Support Center
P.O.Box 152560
Irving, TX 75015-2560

An "800" number will be provided to users to call for defect-related service.

IBM Graphics Printer (5152-2): Unlike the IBM Graphics Printer (5152-2) the 3812 attaches as on the serial port. Additional new functions offered by the Pageprinter are:

- Letter-quality print (240 x 240 dots per inch)
- 12 pages per minute maximum
- Vector graphics support
- Zero, 90, 180, and 270 degree print orientations
- Alternate paper cassette
- Cut-sheet input
- Gummed labels
- Offset, sequential output
- Lower noise level

There is one difference between 3812 and IBM Graphics Printer output. On the Pageprinter, lines that exceed page width are truncated (no line wrap).

SYSTEM PLANNING CONSIDERATIONS

Service Space Envelope: The support surface must be rigid, stable, and capable of supporting 60kg (141 lbs.). The minimum height is 660mm (26 in.), the maximum height is 914mm (36 in.). Either a stationary or movable support is acceptable.

Stationary Support: If carpeting or the condition of the floor make moving the support difficult, a stationary support is required. If the printer can slide on the surface of the stationary support, the support surface must be no smaller than 915mm (36 in.) wide by 710mm (28 in.) deep. Such a support requires the following floor space:

Height: 2,032mm (80 in.)
Width: 1,448mm (57 in.)
Depth: 1,473mm (58 in.)

If the printer cannot slide easily on the support surface, the support surface must be no smaller than 690mm (27 in.) wide by 480mm (19 in.) deep and no larger than 1,295mm (51 in.) by 1,092mm (43 in.).

A minimum of 760mm (30 in.) is required around the front and both sides of the support surface. A minimum of 915mm (36 in.) is required at the rear.

Movable Support: If the support can be easily moved away from the wall, the support surface must be no larger than 1,295mm (51 in.) by 1,092mm (43 in.). In this case the following minimum floor space is required:

Height: 2,032mm (80 in.)
Width: 1,728mm (68 in.)
Depth: 1,930mm (76 in.)

In addition, the support surface must be no smaller than 690mm (27 in.) by 480mm (19 in.). In this case the following minimum floor space is required:

Height: 2,032mm (80 in.)

Width: 1,448mm (57 in.)
Depth: 1,473mm (58 in.)

An optional Pageprinter Stand will be available for purchase to support the Pageprinter.

SPECIFY

This section lists items which will be furnished when specified on an initial machine order. Unless otherwise noted, these specify features are only available at the time of manufacture. The number to the right of the item is the Feature Code.

- Voltage Group: The Voltage Group requirement is determined by the 3-digit country code. (100V, 120V, 200V, 220V, 400V): No specify.
- Frequency Group:

50 Hz	(100V)	1348406
50 Hz	(200V)	1348403
50 Hz	(220V)	1348405
50 Hz	(240V)	1348404
60 Hz	(100V)	1348407
- Country Group: The Country Group requirement is determined by the 3-digit country code. The Country Group contains the safety labels for the 3812 Pageprinter. No specify required.
- Language Code: The following codes are for use only when a country wishes to specify a language other than the one that is pre-assigned to a country number. These codes must be used in conjunction with the 9020 Language Specify Code.

#0073 Japanese
#0077 Canadian French

Power Cords: Power cord requirements, with the exception of Chicago, are determined by the 3-digit country code and are "No Specify" items.

Australia, New Zealand	5640664
Austria, Belgium, Finland,	
France, Germany, Greece,	
Netherlands, Norway,	
Portugal, Spain, Sweden	6952320
Denmark	6952329
Israel	6952383
Italy	6952374

(final assembly and line cord for	
Mexico City only)	

SPECIAL FEATURES

System/36, System/38 Attachment Feature (#3015, P/N 1348409): Required when attaching the 3812 to a System/36, System/36 PC, System/38 or 5294 communicating to the System/36 or System/38. The 3812 emulates the 5219 printer (Enhanced Support does not apply to the 5219 Emulation). The System/36, System/38 Attachment Feature includes an attachment card and cover that mounts on the back of the 3812; a twinaxial connector module that is self-terminating and also allows cable-through connection to other devices; a System/36, System/38 Attachment microcode and font

diskette; and the necessary publications for installing and using the feature. The attachment feature connects to the host with standard twinaxial cable and connectors or the IBM Cabling System.

Printer Stand (#3050, P/N 1348481): Offers convenient support for the IBM Pageprinter. Magnetic latching doors provide access to supplies storage. Pearl White baked enamel finish matches the 3812 and blends well into any environment. 4 casters feet make it easy to relocate stand and printer. Dimensions: 686 x 544 x 660mm (27 x 21.5 x 26 in.). Gross shipping weight: 2x kg (60 pounds).

Blaync Communications (#3060, P/N 1348496): Required when attaching the 3812 to a 3705, 3725 or ICA for VM support via program offering 5798-DTE.

Feature Fonts: These program products provide proportionally spaced, typographic fonts for use with the 3812. They are digitized at 240 x 240 dots (pels) per square inch and are licensed to IBM. Each of these five optional 3812 Pageprinter Feature Font groups is available for a one-time charge. In order to use these Feature Fonts on the Pageprinter, the 3812 Pageprinter VM Support (5798-DTE) program offering must be installed. The 3812 VM program will download the fonts from the host to the IBM Pageprinter "as needed". These Feature Fonts are not available for the Pageprinter when attached in a PC-only installation or when attached to the System/36 and System/38.

Printer Sharing Card (#3115, P/N 1348408): Allows attachment of the 3812 to up to 8 PCs (any mix of IBM PC, PC/XT, PC/AT, PC Portable). The IBM PC/DOS Pageprinter Driver program offering (P/N 6466981) is required for use with the Sharing Card as it provides job separators, paper cassette selection, regular and alternate fonts and improves printer utilization in the multiple-user environment.

RT PC System Attachment (#3155, P/N 1696683): Machine requirements:

- IBM Personal Computer Attachment
 - PC, PC XT, 3270 PC and Portable PC, each equipped with an Asynchronous Communications Adapter (#2074)
 - PC AT or 3270 Personal Computer AT, each equipped with a Serial/Parallel Adapter (#2015)
- IBM Processors for VM Attachment:
 - System/370 Models 138 through 168
 - 303x, 308x, 3090, and 43XX processors
- Controllers -- operable at speeds up to 19.2K bps, full-duplex or half-duplex nonswitched lines, running under EP or PEP:
 - 3705 Communication Controller
 - 3725 Communication Controller
 - Communication Adapter on 4321, 4331, or 4361
- System/36, System/38, and 5294 Attachment:
 - System/36/38 Attachment Feature (#3015) on 3812
 - Microcode diskette
 - Twinaxial connector module (provides self-determination and cable-through capabilities)
- System/88 Attachment:
 - 4575 or 4576 Processor with Full Modem Asynchronous Line Adapter (#1201)

Programming Requirements: The Pageprinter 3812 Model 2 operates under the programs currently listed for the 3812.

IBM 3270 Information Display Systems Attachment Feature (#3190, P/N 04F5278): The 3270 Information Display Systems Attachment feature provides the hardware interface for the 3812 Model 2 Pageprinter.

Two modes of operation are supported, 3268 mode and IPDS mode. Non-GDDM/DW370 applications are supported in the 3268 mode.

Machine requirements: 3812 Model 2 Pageprinter is required for the 3270 Information Display Systems Attachment.

MACHINES

M 3812.11
JUL 87
MAJOR REVISION

Programming requirements: The system programmer should configure the system as though a 3268 were installed.

GDDM 2.1.1 must be at the latest PTF level (October 87 or Later) in order to support the 3812 Model 2 advanced print functions. Contact your service representative for assistance.

The Intelligent Printer Data Stream Reference, S544-3417-00, will assist users in adapting their applications to take advantage of the advanced printing functions offered by the 3812.

3812 Bar Code Printing

The 3812 Pageprinter provides advanced printing capability for automatic identification (AI) applications where information must be printed in machine-readable form. With the appropriate programming support, the 3812 can produce bar code labels and documents that meet the current standards of major industry groups such as:

- Automotive Industry Action Group (AIAG)
- Department of Defense Logistics Applications of Automated Marking and Reading Symbols (LOGMARS)
- Health Industry Bar Code Council (HIBCC)
- American National Standard Institute (ANSI)
- European Article Numbering (EAN)
- Uniform Product Code Council (UPCC)

Bar Codes: The 3812 Pageprinter meets current industry standards for the following bar codes:

- Code 3 of 9
- Interleaved 2 of 5
- UPC (A/E), EAN (8/13)
- MSI Plessey
- Industrial 2 of 5
- Matrix 2 of 5

The highest densities supported for these bar codes are given below. Lower densities are also supported.

Bar code type	Average	Ratio or	Maximum
---------------	---------	----------	---------

	narrow element width (mils)	magnification	Character Density (cpi)
Code 3 of 9	13	2.00-3.00-to-1	5.92
Interleave 2/5	13	2.00-3.00-to-1	9.62
UPC/EAN	13	.98	10.99
MSI Plessey	13	2.00-3.00-to-1	6.41
Industrial 2/5	13	2.00-3.00-to-1	6.41
Matrix 2/5	13	2.00-3.00-to-1	9.62

Bar code element width is selectable in 4-mil increments within a range from 13 mils to 208 mils. The ratio of wide to narrow elements is selectable in increments within a range from 2.0-to-1 to 3.0-to-1. Bar code height is selectable in increments up to a total height of the page. Use of check digits and printing of human readable information are optional where allowed by bar code standards.

The 3812 is capable of integrating bar codes with standard text, large characters, OCR, graphics, and logos where these elements are required in formatting of labels and documents.

Customer Responsibilities: The customer is responsible for:

- Evaluation of 3812 bar code quality for application suitability, including compliance with applicable industry standards and practices.
- Keeping the printer properly maintained.
- Using quality forms and label stock.
- Replacing toner to maintain minimum print contrast signal (PCS) allowed for the user's application.

For a successful automatic identification application, the customer should be knowledgeable of industry practices and recommendations for implementing quality control procedures for monitoring the printing quality of bar code labels and documents.

Paper Limitations: For maximum bar code readability, the user should evaluate paper and label stock carefully for satisfactory printing and handling. Paper and labels should be "xerographic" type, consistent with the limitations on the base 3812.

Pressure-sensitive, adhesive-backed labels are supported; card stock is not supported.

Reader Compatibility: Bar codes printed by the 3812 are compatible with recognition equipment operating with visible (B633 nm), near-infrared (B800 nm), and infrared (B900 nm) light sources.

Software Support: 3812 bar code printing and label formatting are not supported with software utilities or applications on S/37X, but the Intelligent Printer Data Stream facilities are provided for the development of user-written applications.

Intelligent Printer Data Stream (IPDS) (#3192, P/N 04F5260): IPDS supports the presentation of text, images, vector graphics, bar codes and at any point on a page.

Machine requirements:

- Specified Operating Environment - System/36:
 - Hardware Requirements:
 - ▲ IBM 3812 Model 2 is required
 - ▲ System/36 Attachment - Local: Attaches to the workstation controller on the 5360, 5362 or 5364
 - ▲ System/36 Attachment - Remote: Remote attachment is via the IBM 5294 Remote Control Unit. An available workstation position and Extended Function A (#3601) is required on the 5294.
 - Software Requirements: The System/36 SSP must be at Release 5.1 or higher to support the 3812.

● Specified Operating Environment - System/38:

- Hardware Requirements: 3812 Model 2 is required

- ▲ System/38 Attachment - Local: Attaches to the workstation controller on the 5380 or 5381.
- ▲ System/38 Attachment - Remote: Remote attachment is via the IBM 5294 Remote Control Unit. An available workstation position and Extended Function A (#3601) is required.
- ▲ System/36 Advanced Printer Function Licensed Program Product (5727-AP1, AP6) is not supported on the 3812 Pageprinter.
- ▲ System/38 Advanced Printer Function Utility Licensed Program Product (5714-UT2) is not supported on the 3812 Pageprinter.
- ▲ The maximum size of an image which can be printed is equivalent to a 7.5 inch x 8.5 inch page. This is based on the availability of a maximum of 450K bytes in the 3812 to hold an uncompressed image.

- Software Requirements: The System/36 SSP must be at Release 5.1 to support the 3812 IPDS feature.

Programming requirements: Programming support for the 3812 Pageprinter IPDS feature is provided by Release 5.1 of System Support Program (SSP) - Program numbers 5727-SS1 (5360 and 5362) and 5727-SS6 (5364).

Specific System/36 programming support includes:

- OCL support of 5219 compatible font selection, LPI selection, page rotation, computer output reduction and drawer selection.
- Displaywrite/36 support of font selection LPI selection, page rotation, drawer selection, bold printing, underscore, overstrike, subscript, superscript, justification and OCR A/B printing. Margin control for typographical fonts is not provided.
- BGU generated graphics printing, and also IPDS graphics files generated from other sources.
- Graphics generated by BGU, GDDM/36, and CADwrite (using the CADwrite GDF PRPQ) can be merged with Displaywrite/36 or RPG/COBOL generated output. Also, image data available in a Displaywrite/36 folder can be merged with Displaywrite/36 generated text for printing.
- Selection of printer options such as font, rotation, drawer, etc. can be made from within an RPG or COBOL program with the IPDS Advanced Functions PRPQ, 5799-CGK (5360 and 5362) and 5799-CGL (5364). In addition, these PRPQs include sub-routines which support printing of bar codes and graphics.
- MSRJE forms control of page rotation and drawer selection.

System/38 Programming Support: Programming support for the 3812 Pageprinter IPDS feature is provided by Release 8 of Control Program Facility (CPF) - 5714-SS1.

Specific System/38 programming support includes:

MACHINES

M 3812.13
JUL 87
MAJOR REVISION

- CL font selection, LPI selection, page rotation, computer output reduction, drawer selection and code page selection.
- BGU and GDDM generated graphics printing.
- DDS font selection, LPI selection, page rotation, drawer selection, code page selection, and bar code printing.

DW/36 supports full page printing on the 3812 IPDS printer from an image data file with a compression ratio of 1.5-to-1 or larger. (Nominally, compression ratios for type written pages exceed 15-to-1 and may be 20-to-1 or 30-to-1 depending on the density of the printed matter.) Images are normally stored and interchanged in compressed form. As the image compression factor approaches a ratio of 1-to-1 (or not compressed at all), the printer buffer size of 450K bytes, for temporary storage of the data stream, limits the image size to 8.5 X 7 inches. There is no restriction on where the image may be placed on the page. It is not expected that compressed image printing will be restricted by this limitation in any but the most extreme cases of continuous halftone images.

Although the 3812 Model 2 Pageprinter will print bar code images, IBM does not warrant that a specific bar code reader will be able to read the bar code images as printed. The customer is responsible for determining the acceptability of the bar codes as printed for their specific application.

3812 Bar Code Printing

The 3812 Pageprinter provides advanced printing capability for automatic identification (AI) applications where information must be printed in machine readable form. With the appropriate programming support, the 3812 can produce bar code labels and documents that meet the current standards of major industry groups such as:

- Automotive Industry Action Group (AIAG)
- Department of Defense Logistics Applications of Automated Marking and Reading Symbols (LOGMARS)
- Health Industry Bar Code Council (HIBCC)
- American National Standard Institute (ANSI)
- European Article Numbering (EAN)
- Uniform Product Code Council (UPCC)

Bar Codes: The 3812 Pageprinter meets current industry standards for the following bar codes:

- Code 3 of 9
- Interleaved 2 of 5
- UPC (A/E), EAN (8/13)
- MSI Plessey
- Industrial 2 of 5
- Matrix 2 of 5

The highest densities supported for these bar codes are given below. Lower densities are also supported.

Bar code type	Average narrow element width (mils)	Ratio or magnification	Maximum Character Density (cpi)
Code 3 of 9	13	2.00-3.00-to-1	5.92
Interleave 2/5	13	2.00-3.00-to-1	9.62
UPC/EAN	13	.98	10.99
MSI Plessey	13	2.00-3.00-to-1	6.41
Industrial 2/5	13	2.00-3.00-to-1	6.41
Matrix 2/5	13	2.00-3.00-to-1	9.62

Bar code element width is selectable in 4-mil increments within a range from 13 mils to 208 mils. The ratio of wide to narrow elements is selectable in increments within a range from 2.0-to-1 to 3.0-to-1. Bar code height is selectable in increments up to a total height of the page. Use of check digits and printing of human readable information are optional where allowed by bar code standards.

The 3812 is capable of integrating bar codes with standard text, large characters, OCR, graphics, and logos where these elements are required in formatting of labels and documents.

Customer Responsibilities: The customer is responsible for:

- Evaluation of 3812 bar code quality for application suitability, including compliance with applicable industry standards and practices.
- Keeping the printer properly maintained.
- Using quality forms and label stock.
- Replacing toner to maintain minimum print contrast signal (PCS) allowed for the user's application.

For a successful automatic identification application, the customer should be knowledgeable of industry practices and recommendations for implementing quality control procedures for monitoring the printing quality of bar code labels and documents.

Paper Limitations: For maximum bar code readability, the user should evaluate paper and label stock carefully for satisfactory printing and handling. Paper and labels should be "xerographic" type, consistent with the limitations on the base 3812.

Pressure-sensitive, adhesive-backed labels are supported; card stock is not supported.

Reader Compatibility: Bar codes printed by the 3812 are compatible with recognition equipment operating with visible (B633 nm), near-infrared (B800 nm), and infrared (B900 nm) light sources.

Software Support: 3812 bar code printing and label formatting are supported on S/36 via the Intelligent Printer Data Stream Advanced Functions utility PRPQ P84094 (5799-CGK) for 5360/62 and P84095 (5799-CGL) for 5364.

Bar code is supported by DDS Keywords in S38 Control Program Facility (CPF) release 8 and later.

Cables: Printer cable for IBM PC, PC/XT, PC Portable, 3270-PC, 3270 Personal Computer AT:

6m (#3030)
24m (#3040)

Modem to printer cable for VM attachment:

6m (#3045)

PC/AT and 3270 Personal Computer AT to RS-232-C adapter cable (required on PC/AT and 3270 Personal Computer AT and should be ordered as a feature of the PC/AT and 3270 Personal Computer AT):

254mm (#0242 of PC/AT)

RT PC:

- Attaching 3812 to RT PC's Serial/Parallel Adapter Card (P/N 6450215, #0215) use:
Serial Printer Cable (9-pin, 3m) P/N 6298993, #8993
- Attaching 3812 to RT PC's Native Serial Ports on Models 20 and 25 use:
Serial Printer Cable (10-pin, 3m) P/N 6294803, #4803
- Attaching 3812 to RT PC's 4-Port Asynchronous RS-232-C Adapter Card (P/N 6294763, #4763) use:
Serial Printer Cable (10-pin, 3m) P/N 6294803, #4803

For System/36 and System/38 Cables: IBM shielded twisted-pair cable (or equivalent) or twinaxial cable is required for attachment of the 3812. Cable and associated accessories may be purchased

from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted-Pair Cable: For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", (GA27-3361). For pricing and ordering information, refer to the appropriate IBM DIRECT catalog.

Twinaxial Cable: For proper identification, installation and application of cable and associated accessories, refer to "IBM 5250 Information Display System Planning and Site Preparation Guide", (GA21-9337). When cable is ordered from IBM specify a date at least four weeks in advance of receiving the machine.

Twinaxial Connector Kit (P/N 7362268): Includes 2 connectors. Twinaxial wire and 1 connector kit are required for each attachment cable. (Individual connectors P/N 7362229 are available for replacement.)

Twinaxial Wire (P/N 7362211): Order must specify the desired length. Twinaxial Wire and 1 connector kit are required for each attachment cable. (This is an indoor/outdoor cable.)

Twinaxial Cable Assembly (P/N 7362267): Includes a connector kit (2 connectors) attached to bulk wire. The required length of wire must be specified on the order. The cost of the wire must be added to the fixed assembly price to obtain the total price of the cable assembly.

Twinaxial Adapter (P/N 7362230): Permits 2 Twinaxial Cable Assemblies to be joined together. Order cable via MSORDER (Category = Bulk Cable) on AAS specifying part number. Allow lead time of 120 days.

Twinaxial Station Protector Kit (B/M 7361807) includes 2 protectors. One is required at each end of each twinaxial attachment cable installed outdoors (either above or below ground level). Individual Twinaxial Station Protectors, P/N 7362426, are available for replacement purposes. Order via MSORDER (Category = Accessory/Supplies) on AAS specifying bill of material number. Allow a lead time of 120 days. Customer Setup: Yes.

Twinaxial Cable is available with Teflon(R) covering. Teflon-covered cable complies with the National Electrical Code requirements for low smoke-producing, plenum-installed cables.

Twinaxial Connector Kit: Includes 2 connectors. Twinaxial wire and one connector kit are required for each attachment cable. Order P/N 7362063 for Teflon-covered cable. Individual connectors P/N 7362229 are available for replacement.

Twinaxial Wire: Order must specify the desired length. Twinaxial wire and 1 connector kit are required for each attachment cable. Order P/N 7362061 for Teflon-covered cable.

Twinaxial Cable Assembly: Includes a connector kit (2 connectors) attached to bulk wire. The required length of wire must be specified on the order. The cost of the wire must be added to the fixed assembly price to obtain the total price of the cable assembly. Order P/N 7362062 for Teflon-covered cable assembly.

SUPPLIES

Choosing the right supplies is very important for customer satisfaction with the 3812. The use of IBM supplies is recommended. The use of xerographic paper is recommended.

The 3812 is shipped with the following supplies installed: a Toner Cartridge, a Photo Conductor Unit, a Developer Unit, a Fuser Unit. 1 Primary Paper Cassette and one Alternate Paper Cassette are also shipped with the machine.

Supplies are not covered under the Agreement for Purchase of IBM Machines or the IBM Maintenance Agreement. IBM Service Representatives will not install supplies; installation of supplies is a customer responsibility.

Customers who frequently use different media or paper sizes should consider ordering additional cassettes. It is the customer's responsibility to ensure availability of supply items for necessary operation of the 3812 and to replenish/replace supplies as needed.

Until customers' usage is determined, customers should stock at least one extra unit of each supply item.

Supplies may be ordered by calling IBM Direct for additional information, including quantity discounts, consult your local IBM Branch Office.

3814 SWITCHING MANAGEMENT SYSTEM

PURPOSE

Provides channel to control unit(s) switching under single point control in combinations up to 128 nodes or a single switch matrix as large as 8 x 16 or 16 x 8. Switching can be effected at up to four locations which may be as distant as 305m (1,000 ft) from each other and connected via customer-supplied loop cable which begins and ends at the model A controller. Power sequencing of switched control units and single location control of control unit two-channel switches can also be managed by the 3814.

MODELS

Cntrlr	Remote Unit	Expansion Unit	-- contains
Model A1 (A01)	B1 (B01)	C1 (C01)	one 4x4 switch
Model A2 (A02)	B2 (B02)	C2 (C02)	one 4x8 switch
Model A3 (A03)	B3 (B03)	C3 (C03)	one 8x4 switch
Model A4 (A04)	B4 (B04)	C4 (C04)	two 4x4 switches

Model Bs require a model A as a prerequisite and can function as a logical expansion of a primary switching location or, if logically independent, can be up to 305m distant. Model Cs attach to either model As or Bs and provide up to 32 nodes which may be logically combined with their prerequisite model to provide larger switching matrices. An alternate model A controller can be attached to the loop with feature #1430. Switching control to the alternate controller may be performed under operator control. This switchover is automatic in the event of some controller malfunctions or control power loss. Operator control is via 3178 model C20 or 3278 model 2 and a maximum of two of these display stations can be used. Attachment of 3178 or 3278 terminals requires feature #1420 and its prerequisite feature #1410. 3604 model 6 may also be used as a local console or up to 305m from the 3814, but the 3604 is no longer available from IBM. One 3178 model C20 or 3278 model 2, with the Control Unit Switch Accessory Feature (P/N 1743301), can be shared between two 3814 subsystems. A maximum of three 3287 model 1s or 2s can be attached with feature #1420 providing hard copy of audit trails and configurations. These printers may be shared with other 3814 systems by using a coax selection switch. The addition of the System Attachment Feature #1440 provides a path to a 3274 or 3276 to allow a terminal attached to the host processor to be used for operator control. The Multi-System Configuration Manager licensed program or similar user-written software is required by feature #1440. Together, they allow control of up to 64 of the 3814 model 4 units and their associated model B and C units from a host-attached terminal.

Authorization to operate the 3814 is incorporated into the product and under control of passwords. With feature #1420 an additional authority level and 32 passwords are provided. A time stamped audit-trail of configuration changes is provided for display and/or printing. The use of installation defined names for configurations, logical channel/control unit interfaces, logical matrices and control unit identification is provided with feature #1420.

The 3814 can switch either data streaming or non-data streaming devices.

Nomenclature: The first number of the switch expression specifies the number of channels and the second number indicates the number of switchable interfaces (with one or more control units). Thus, a 4 x 8 designates a switch capable of connecting any of four channels to any combination of eight switchable interfaces. The inter-sections of the channel and switchable interfaces within the 3814 are called nodes and, taken together, comprise the switch matrix. Thus, a 4 x 8 switch has a switch matrix of 32 nodes.

Limitations: The 3814 is designed to function only in a raised floor machine room environment. The 1419 equipped with #7720 or #7730 (single or dual address adapter) requires external interrupt features on the associated CPUs to enable the 1419s to operate. These features are not supported by the 3814. 4.5M bps devices switchable through a 3814 require Reduced Diameter Channel cable between the 3814 and the channel. Channel and control unit cable length restrictions must be observed.

Note: Contact Special Equipment Engineering for 2835/2305 attachment information.

Prerequisites: Every 3814 system requires a model A controller and a console device. The console device may be a 3178 model C20 or a 3278 model 2. If the 3814 is attached to the host processor, feature #1440 is required, and the console function can be performed by a host-attached terminal. However, a terminal attached directly to the 3814 is required during setup and to run diagnostics. If feature #1430 and feature #1440 are installed on 3814 model A, the alternate 3814 model A must have the same features installed. The 3814 attaches to byte and block multiplexer channels of any S/370 model 135 and up, 3031, 3032, 3033, 3081, 3083, 3084, 3090, 4331, 4341, 4361, or 4381 Processor.

HIGHLIGHTS

- Provides the capability to receive, interconnect and repower both the in-bound and out-bound lines of the standard S/360 and S/370 I/O interface.
- Includes an integrated microcode driven processor.
- A confirmation mechanism ensures switching has been done.
- Changes configuration quickly via prestored configuration definitions
- Provides storage for up to 80 configurations including current and prior configuration.
- Provides an additional 384 cross-point configurations with feature #1420.
- Standard operation permits channel switching only when channel interface is active.
- Switches channels having the Two-Byte Interface using twice the nodes of other channel to control unit switching.
- The operator can display current configuration status without affecting on-going operations.
- Permits up to four physical locations per 3814 for one logical or multiple logical switches.
- Provides single control point for control units with the two-channel switch and remote switch attachment features.
- Provides centralized control for up to 64 of the 3814 systems with feature #1440.
- Allows any host-attached terminal to act as a switching console with feature #1440.
- Provides storage for up to 7 two-channel switch combinations including current and prior configurations.
- Provides an additional 320 two-channel switch stored configurations with feature #1420.
- Allows 64 multiple configurations, each one specifying a list of up to 32 cross-point and/or two-channel switch configurations.
- Provides for power sequencing of attached control units.

MACHINES

- Each 3814 model may be placed under power sequence control of up to four processors so that it will be powered on via the powering of the first processor and powered off via the last processor to power down.
- Permits switching of control units operating at 4.5M bps.

RAS Characteristics: The 3814 enters a diagnostic check-out procedure as part of the power-on sequence. Once in operation, operating elements are continuously monitored to detect malfunctioning hardware within the 3814. Upon detection of certain malfunctions, an audible alarm and a visual indicator alert operators to a potential problem. Error indicators are saved within the system for assisting in later diagnosis. Since on-going use of the switchable configuration may continue, the user may not have experienced impact and the net result of the detected failure may be an early alert to a pending problem.

The modularity of the 3814 power design and the ability to isolate power contribute greatly to its serviceability. Since the channel switching function remains static between changes and the CE may power-down and power-up individual frames and portions of the system, he may effect repair of failing elements of the 3814 while customer use of other elements continues. One may power-down, repair the failing element, and power-up the isolated portion of the system and return it to operational use. Major elements of the 3814s to which the above description applies are: The 3814 processor and its storage, the diskette drive, the channel interface switches, the 4 x 4 switch elements and some power supplies. The Alternate Controller Feature allows duplication of the control function in a 3814 system.

Configuration Guidance: Refer to Tables A, B or C for the model/feature combinations recommended for various I/O switching requirements. If requirements are for multiple remote switches, apply the formula outlined under the heading, "Multiple Remote Switches." These tables are not intended to reflect all possible configuration options. If the Alternate Controller Adapter Feature is installed, the appropriate model A will be substituted for a model B.

Single Switch Configurations (Table A)

Size	Model/Feature Required
4x4	A01
4x8	A02 or A01 + B01
4x12	A02 + C01 or A02 + B01
4x16	A02 + C02 or A02 + B02
8x4	A03 or A01 + #1531 + B01
8x8	A02 + #9721 + C02 + #1521 or A02 + #1531 + #1532 + B02
8x12	A03 + C03 + B03 or A03 + B03 + B03
8x16	A02 + #9721 + C02 + #1521 + B02 + #9721 + C02 + #1521
12x4	A03 + #9720 + C01 + #1520 or A03 + #1532 + B01
16x4	A03 + #9720 + C03 + #1520 or A03 + #1532 + B03
16x8	A02 + #9721 + C02 + #1521 + #1531 + B02 + #1532 + C02 + #1521

Multiple Primary or

Multiple Remote Switches (Table B)

Switch Combos	Primary Loc. Model/Feat. Required	Remote Loc. Model/Feat. Required
2 (4x4)	A04	B04
3 (4x4)	A04 + C01	B04 + C01
4 (4x4)	A04 + C04	B04 + C04
(4x8) + (4x4)	A02 + C01	B02 + C01

(4x8) + 2 (4x4)	A02 + C04	B02 + C04
(4x8) + (4x8)	A02 + C02	B02 + C02
(8x4) + (4x4)	A03 + C01	B03 + C01
(8x4) + 2 (4x4)	A03 + C04	B03 + C04
(8x4) + (4x8)	A03 + C02	B03 + C02
(8x4) + (8x4)	A03 + C03	B03 + C03

Note: Either the model/feature at the primary or the remote locations can easily satisfy the requirements outlined under switch combinations. Also, any model B requires a prerequisite model A.

Switch Combinations Including an 8x8

Or Greater (Table C)

Switch Combos	Model/Feat. Required
(8x8) + any combination from Table B	Table A Build-up + Remote Build-up from Table B
(8x12) + (4x4)	Table A + C01
(8x12) + 2 (4x4)	Table A + C04
(8x12) + (4x8)	Table A + C02
(8x12) + (8x4)	Table A + C03
(12x4) + (4x4)	Table A + C01 + C04
(12x4) + any combination from Table B	Table A + Remote Build-up from Table B
(12x8) + (4x4)	Table A + C01
(12x8) + 2 (4x4)	Table A + C04
(12x8) + (4x8)	Table A + C02
(12x8) + (8x4)	Table A + C03
(16x4) + any combination from Table B	Table A + Remote Build-up from Table B

Multiple Remote Switches: Where the requirement is for multiple remote switches, the following formula should be used. No more than three remote locations are permitted. Using the switch definition from Table A or B, calculate the number of nodes by location by multiplying the switch expression. Substitution in the tables of an appropriate model B Remote Unit may be required in lieu of the equivalent size A or C model.

$$(\text{NUMBER OF PRIMARY NODES}) + (\text{NUMBER OF REMOTE NODES, 1st LOCATION}) + (\text{NUMBER OF REMOTE NODES, 2nd LOCATION}) + (\text{NUMBER OF REMOTE NODES, 3rd LOCATION}) \leq 128 \text{ (cannot exceed 128)}$$

For additional configuration guidance, refer to the "IBM 3814 Switching Management System Product Description Manual", GA22-7075.

Stored Configurations: The number of stored configurations is determined by the following formula:

$$N = 10 \times \frac{\text{Ch} \times \text{CU}}{16}$$

Where N is the number of configurations stored per logical switch. The previous and current configurations always occupy configurations number 0 and 1, respectively.

For example, each 4x4 can have eight customer-defined configurations, plus previous and current. An 8 x 16 has 78 defined plus previous plus current.

"Ch" is the number of channel interfaces on the logical switch.

"CU" is the number of control unit interfaces on the logical switch.

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

- Cable for 3604 model 6. See "Accessories".
- Color: (A or B models) #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray, #9066 for pearl white.
- Unit Emergency Power Off: UEPO switches are located on model A Controllers and model B Remote Units. Depression of UEPO instantly drops power in any models making up the Switching Management System which are interconnected for power sequencing as well as control units which are under its power sequencing control.

Specify #9720 on model A3, A4, B3 or B4 when ordering special feature #1520 on an attached model C1, C3 or C4. #9720 must be removed if model C1, C3 or C4 is detached. #9720 requires the appropriate C Model at installation.

Specify #9721 on model A2, A4, B2 or B4 when ordering special feature #1521 on an attached model C2 or C4. #9721 must be removed if model C2 or C4 is detached. #9721 requires the appropriate C Model at installation.

- 4.5M bps Support (#9001): This feature code is to designate that the 3814 is operating at 4.5M bps data transfer rate and no parts or instructions are shipped. For 3814s shipped before September 1, 1987 Reduced Diameter Channel cables, cable group 0815, must be installed between the 3814 and the channel for those channels operating at 4.5M bps.

- Machine Nomenclature: (models A and B)

Canadian French #2935 Spanish #2931
English US #2924

SPECIAL FEATURES

Expanded Storage (#1410): (Model A) Required when #1420 or #1430 or both. Maximum: One per model A. Field Installation: Yes.

Display/Printer Attachment (#1420): (Model A) Provides attachment of up to two 3178 model C20s or two 3278 model 2s, three 3287 model 1s or 2s, additional stored cross-point and two-channel switch configurations, additional 32 security passwords across four authority levels and the capability to assign installation defined names for configurations, and time stamped audit-trail of configuration switching activity for display on the console. Prerequisites: #1410. Maximum: One per model A. Field Installation: Yes.

Alternate Controller (#1430): (Model A) Provides backup to the model A in a system through the attachment of a second model A. Both A models must have this feature installed. The Alternate Controller takes the place of one model B switching unit on a 3814 configuration. Prerequisites: #1410. Maximum: One per model A. Field Installation: Yes.

System Attachment (#1440): Model A permits attachment to a 3274 to provide a control path to a host processor. With appropriate programming support, the 3814 can be controlled by a host-attached terminal acting as a switching console. A 3178 or 3278 console attached through feature #1420 is optional when this feature is installed. Prerequisites: #1420. Maximum: One per model A. Field Installation: Yes.

Channel Expansion Internal - Four Control Unit Interfaces (#1520): (Models C) Required when combining a model C with a model A or B for the purpose of expanding the number of channel interfaces. This feature is required when combining a 4 x 4 (C1) or 8 x 4 (C3/C4) with an 8 x 4 (A3/A4/B3/B4) to create a 12 x 4 or 16 x 4 switch. Prerequisites: Models A3, A4, B3 or B4 with specify #9720. Limitations: A4 or B4 models must be cabled as an 8 x 4. Cannot be installed with #1521. Maximum: One per model C1, C3 or C4. Field Installation: Yes.

Channel Expansion Internal - Eight Control Unit Interfaces (#1521): (C models) Required when combining a model C with a model A or B for the purpose of expanding the number of channel interfaces. This feature is required when combining a 4 x 8 (C2/C4) with a 4 x 8 (A2/A4/B2/B4) to create an 8 x 8 switch. Prerequisites: Models A2, A4, B2 or B4 with specify #9721. Limitations: A4 or B4 models must be cabled as a 4 x 8. Cannot be installed with #1520. Maximum: One per model C2 or C4. Field Installation: Yes.

Channel Expansion External (#1531, #1532): #1531 for first 4 x 4, #1532 for second 4 x 4. This feature provides an external cable connection for the control unit input of a 4 x 4 matrix for the purpose of expanding the number of channel interfaces for an A, B, or C model. #1531 is required to allow connection through external cables to control unit inputs of the first 4 x 4 matrix in models A1, B1, C1, A2, B2, C2, A4, B4 or C4. #1532 is required to allow connection through external cables to control unit input of the second 4 x 4 matrix in models A2, B2, C2, A3, B3, C3, A4, B4 or C4. #1531 is required to create an 8 x 4 switch within an A4, B4 or C4. The #1531, #1532 may exist without the connection of external cables. Prerequisites: A, B or C models -- when expanding the channels on an 8-channel switch, #1531 and #1532 are required. Limitations: #1531 cannot be installed on A or B models with #9721. #1532 cannot be installed on A or B models with #9720 or #9721. #1531 cannot be installed on A3, B3 or C3 models. #1532 cannot be installed on A1, B1 or C1 models. Maximum: One #1531 for model A1, B1, C1, A2, B2, C2, A4, B4 or C4. One #1532 for A2, B2, C2, A3, B3, C3, A4, B4 or C4 models. Field Installation: Yes.

Control Unit Power Sequencing (#1811, #1812, #1813, #1814): Each feature provides power sequencing control for up to four control units attached to any model 3814. #1811 for first group of control units, #1812 for second group of control units, #1813 for third group of control units, #1814 for fourth group of control units. Limitations: Features must be installed in sequence. Maximum: One each per model A, B or C. Field Installation: Yes.

Remote Two-Channel Switch Control - Basic (#6010): Provides single point control for the remote enable/disable function on control units having two-channel switches with remote switch attachment features. #6010 provides for control of eight pairs of interface selections. Prerequisites: Two-channel Switch and Remote Switch Attachment and/or Two-channel Switch, Add'l and Remote Switch Attachment, Add'l required on affected control units. Maximum: One per model A, B or C. Field Installation: Yes.

Remote Two-Channel Switch Control - Additional (#6011, #6012, #6013): Provides expansion of the two-channel switch control capability for controlling eight additional pairs of interface selections. #6011 for first additional, #6012 for second additional, #6013 for third additional. Limitations: Features must be installed in sequence. Prerequisites: #6010 ... Two-channel Switch and Remote Switch Attachment and/or Two-channel Switch, Add'l and Remote Switch Attachment, Add'l required on affected control units. Maximum: Three groups of eight per model A, B or C. Field Installation: Yes.

System Power Sequencing - Add'l (#6350): Provides power sequencing control from the 5th through 8th system. Maximum: One per model A, B or C. Field Installation: Yes.

MODEL CONVERSIONS

The following model changes are field installable -- model A1 to A4, model B1 to B4, model C1 to C4. All other model changes are available at time of manufacture only.

MACHINES

ACCESSORIES

Cables: Cables to interconnect 3178 C20 units and/or 3278 and/or 3287 units and 3814 units may be purchased from IBM or a customer selected source. See "IBM Input/Output Equipment Installation Manual - Physical Planning: System/360, System/370, 4300 Processors", GC22-7064, for cable and connector specifications.

Assembled cables may be purchased from IBM. Order via MES from plant of manufacture. Specify cable assembly number. Allow a lead time of 120 days.

Item	Number	Description	Max Length
Assm.	1563155	Loop Cable Assembly (indoor)	304.8m (1,000 ft)

SUPPLIES (NONE)

3820 PAGE PRINTER

PURPOSE

The 3820 Page Printer is a high quality, laser printer which provides cut-sheet duplex printing for distributed printing applications in the following operating system environments:

- MVS - MVS/SP with JES2 or JES3 on both S/370 and XA processors
- VSE - VSE/SP or VSE/AF with VSE/POWER on S/370 mode processors
- VM - VM/SP or VM/SP HPO on S/370 mode processors.

The 3820 Page Printer operates at speeds up to 20 pages per minute for single-sided printing and can be attached via SDLC communications or may be directly attached to a System/370 channel in the MVS, VSE and VM environments. Both attachments are driven through VTAM/SNA. (Canada only) The 3820 Page Printer can also be attached to an IBM PC connected to an IBM PC Network or a Corvus OMNINET* local area network.

* OMNINET is a trademark of Corvus Systems, Inc. <

SPECIAL APPLICATIONS

Remote PrintManager: The Remote PrintManager is a PC AT based product which allows selected font data, overlays, and page segments that are present in Advanced Function Printing data streams to be locally available to a remote 3820 Page Printer. The PC AT communicates with an MVS host via TP lines and to a 3820 printer via a S/370 Channel Emulator card resident in the PC AT.

Remote PrintManager is designed to reduce communication line traffic for remotely attached 3820s, to provide performance improvements for "resource intensive" applications, and to provide cost savings in the communication area.

For additional information on the Remote PrintManager, see Programming Announcement dated March 17, 1987.

MODELS

Model 1 001: Provides support for languages and paper sizes.

Prerequisites

- MVS - Print Services Facility/MVS (5665-275)
- VSE - Print Services Facility/VSE (5666-319)
- VM - Print Services Facility/VM (5664-198)
- PC-LAN - PrintManager (5875-XXX)

Note: Refer to the USM for the above products for specific release levels and other software prerequisite products.

HIGHLIGHTS

- Advanced Function Printing capability
- All Points Addressable printing
- 240 X 240 pel
- Up to 20 pages per minute
- Remote printing via SDLC communications facilities
- S/370 channel attachment via VTAM
- PC-LAN attachment
- Duplex printing

DESCRIPTION

The 3820 Page Printer functions as a remotely-attached printer via SDLC communication or channel attach through VTAM in an SNA environment under MVS/370 and MVS/XA with MVS/JES2 and MVS/JES3; under VSE/SP or VSE/AF with VSE/POWER; under VM with VM/SP or VM/SP HPO. (Canada only) The 3820 Page Printer can also be attached to an IBM PC Network or a Corvus OMNINET local area network via SDLC communication attachment to an IBM PC. <

The 3820 Page Printer supports a wide variety of paper sizes and weights, which are country dependent. The paper path is set to the size of paper which the printer will be handling (Letter or A4) by the plant of manufacture and the IBM Service Representative. The 3820 Page Printer prints on the following size paper: Letter (8-1/2 x 11), Legal (8-1/2 x 14), A4 (210mm x 297mm), B4 (257mm x 365mm), B5 (182 x 257mm), and Executive (7 x 10.5, 7.25 x 10.5, and 7.5 x 10.5). Paper weights for simplex printing range from 20 to 24 pounds (75 to 90 G/m2) for legal size paper and from 16 to 24 pounds (60 to 90 G/m2) for other supported paper sizes. 42 pound (157.5 G/m2) A4 paper size is also supported. Additionally, self-adhesive label sheets and 2-, 3-, and 4-hole punched paper are supported as print media.

Documents are printed as single sets, and pages exit the printer face down in transmitted page sequence. Multiple sets require retransmission from the host. Duplex printing is provided in both normal mode and tumble mode. Each may be specified by page. Paper weights supported for duplex are 20 to 24 pound (75 to 90 G/m2). (Japan only) 17 pound (65 G/m2) paper is supported by duplex. <

The 3820 Page Printer provides a single font (Prestige Elite) as standard and receives other fonts via downloading from the host. Up to 32 single byte fonts per sheet may be stored and printed, depending upon available Pattern Storage, with fonts available from IBM in sizes from 4 points to 36 points. (A point is a typesetting measure of character size and is approximately 1/72 of an inch.)

Normal typewriter fonts are also supported in 10 and 12 pitch. Fonts may be printed in any of four orientations: 0, 90, 180, and 270 degrees.

The 3820 Page Printer provides the capability of processing single and double byte fonts, selectable by the customer. This allows the use of double byte character sets, such as required for Kanji, in addition to the smaller character sets characteristic of US fonts.

The following font offerings are available for the 3820 Page Printer in MVS, VSE, or VM environments:

- All IBM 3800 Mdl 3 or Mdl 8 Compatibility Fonts, including selected IBM 6670 Fonts, provide compatible fonts for alphanumeric and selected graphic applications. The 3820 Page Printer prints the OCR-A and OCR-B fonts with the same high quality as other type styles. However, due to variations in print registration and reader requirements, IBM does not warrant that these characters are readable by OCR reading devices. Users of these fonts should thoroughly test read-write compatibility before implementing the 3820 Page Printer for OCR.
- IBM Typographic Fonts which are available for the IBM 3800 Mdl 3 or Mdl 8 and provide Sonoran Serif Fonts* (5771-ABA), (Data derived under license from The Monotype Corporation, Limited), Sonoran Sans Serif Fonts (5771-ABB), Pi and Special Fonts (5771-ABC), APL2 Fonts (5771-ADB), and Datal Fonts (5771-ADA). This offering allows support for 11 languages and font sizes from 4 to 36 points.
- IBM Double Byte Character Fonts-Kanji Source Fonts for the 3820 Page Printer, (5771-ADE), Kanji Object Fonts for the 3820 Page Printer/MVS, (5771-ADF), and Kanji Object Fonts for the 3820 Page Printer/VSE, (5771-ADG).

(Canada only>The IBM LAN PrintManager program includes 54 (IBM supplied) 240 by 240 pel (A pel is defined as a picture element) per square inch fonts, including representations of the IBM 5152 Graphics Printer fonts.<)

Data Stream: The 3820 Page Printer supports the Intelligent Printer Data Stream (IPDS) only. Other data streams are supported through the Print Services Facility for the printer. See the "Programming Section of the Sales Manual Pages" for details.

The 3820 Page Printer is configurable by the customer. The Control Panel is used to specify changes or unique operating and printing requirements. The following may be specified at installation, or at any time the customer needs change:

- Country of operation.
- Display support for text message in French (Canadian), French (France), English (US), German, Spanish (Spain), or Italian. For non-supported languages, numeric messages may be displayed.
- Default paper sizes.
- Type of SDLC communication attachment.

In addition, the Control Panel is also used for initiating printer diagnostics, creating duplicate or back-up internal diskettes, and controlling the printer.

Printer

- All points addressable printing at 240 by 240 picture elements (pels) per square inch is supported.
- Prints at speeds up to 20 pages per minute for single-sided printing on letter and A4 size paper. Actual speed depends on the application, host programming support and communication facility. Refer to the "IBM 3820 Page Printer Introduction and Planning Guide", G544-3520, for additional details.
- Two side printing (duplexing) at speeds of up to 10 pages (20 sides) per minute is supported for letter or A4 size paper. Two modes of duplexing, normal and tumble, are available.
- Two paper supplies: A hopper holding 1,100 sheets of paper, and a cassette holding 250 sheets of paper.
- One output stacker holding 1,250 sheets, in transmitted page sequence.
- Automatically offsets printed jobs 1/2 in. for easy job separation.
- Up to 32 single byte fonts per sheet may be stored and printed, depending upon available Pattern Store, with fonts ranging in size from 4 points to 36 points.
- Supported as an SNA/SDLC remote printer via communications in S/370 environments under MVS/SP-JES2 and JES3 Version 1 Release 3.4 or higher; XA environments under MVS/SP-JES2 and JES3 Version 2 Release 1.2 or higher; in VSE environments under VSE/SP 1.1.0 or VSE/SP 2.1.0 with VSE/POWER; in VM environments under VM/SP Release 4 or higher, or VM/SP HPO Release 4.2 or higher.
- Supported as a direct S/370 Channel attach printer, through VTAM/SNA, in System/370 environments under MVS/SP-JES2 and JES3 Version 1 Release 3.4 or higher; XA environments under MVS/SP-JES2 and JES3 Version 2 Release 1.2 or higher; in VSE environments under VSE/SP 2.1.4 or VSE/AF 2.1.3 with VSE/POWER 2.2; in VM environments under VM/SP Release 4 or higher, or VM/SP HPO Release 4.2 or higher.
- (Canada only>Supported as an SDLC communications printer when attached to an IBM PC connected to an IBM PC Network under DOS 3.1 or a Corvus OMNINET under DOS 2.0 or DOS 3.0 with appropriate prerequisite support on Corvus OMNINET.<)

Control Panel

- Primary user interface for control of the printer, diagnostics, and printer configuration information.
- Display supports any of the following languages plus numeric codes for user interaction with the printer: French (Canadian), French (France), English (US), German, Spanish (Spain), Italian. Language is selected by configuration options and may be changed as required.
- 22 active keys on the keypad.
- 32-character vacuum fluorescent display for displaying messages.
- Audible alarm for user feedback when keying information and for alerting the user to various conditions needing attention. The alarm has a volume control which may be adjusted for the printer environment.

Attachments

- Communications:
 - SDLC Link.
 - SNA via ACF/VTAM, PU Type 2.0 and LU Type 6.2 supporting APPC (Application Program to Program Communication).
 - ACF/NCP
- S/370 Channel Attachment through VTAM
 - 3274 Mdl A "like" Attachment.
 - SNA protocol identical to a communications attachment with ACF/VTAM.
 - Channel commands carry both the printer data stream and SNA protocol.

Physical Specifications:

Width - 152cm (60 in)
 including cassette and hopper
Depth - 67cm (26.5 in)
Height - 119cm (47 in)
 including Control Panel
Weight - 272Kg (600 lbs)

Software Required MVS/VSE/VM: Print Services Facility/MVS (5665-275), Print Services Facility/VSE (5666-319), or Print Services Facility/VM (5664-198), and their prerequisite Licensed Programs are required for the operation of the 3820 Page Printer. See the "Programming Section of the Sales Manual" for detailed information.

(Canada only>IBM Personal Computer Local Area Network. The IBM Local Area Network PrintManager is required. See the "Programming Section of the Sales Manual" for detailed information.<)

Hardware Required, MVS Communications

- Processors
 - S/370 mdls 158 and 168
 - 303X and 308X Processors
 - 4341 Processor
 - 4361 Processor Mdl Group 5
 - 4381 Processors
 - IBM Processors operating in S/370 Extended Architecture mode.
 - 9375 Model 60
 - 9377 Model 90
- Controllers
 - 3705 controller or equivalent
 - 3725 controller or equivalent
 - 3720 controller or equivalent

- Integrated Communications Adapter (ICA) on the 4331 and 4361 Processors (ICA Attachment supports a data rate of no greater than 9600 bps)
- Direct attachment up to 100 ft. is supported on the Communication Controller or ICA configured with the appropriate features.
- EIA Interface Cable for modem attachment.
- Self-clocking external modem or modem eliminator which supports EIA RS-232-C interface and protocol. The following IBM modems are supported by the 3820 Page Printer.
 - Non-switched

3863-1	2400 bps	(Telegraph)
3864-1	4800 bps	
3865	9600 bps	
3868-1	2400 bps	
3868-2	4800 bps	
3868-3	9600 bps	
3868-4	9600 bps	
3872	1200/2400 bps	
5979-L41	2400/4800/9600/19200 bps	(Baseband)
 - Switched

3863-2	2400 bps	
3864-2	4800 bps	

Hardware Required, VM Communications

- Processors
 - S/370 models 158 and 168
 - 303X, 308X and 3090 Processors
 - 4331 All models
 - 4341 All models
 - 4361 All models
 - 4381 All models
 - 9370 All models
- Controllers
 - 3705 controller or equivalent
 - 3725 controller or equivalent
 - 3720 controller or equivalent
 - Integrated Communications Adapter (ICA) on the 4331 and 4361 Processors (ICA Attachment supports a data rate of no greater than 9600 bps)
 - Direct attachment up to 100 ft. is supported on the Communication Controller or ICA configured with the appropriate features.
- EIA Interface Cable for modem attachment.
- Self-clocking external modem or modem eliminator which supports EIA RS-232-C interface and protocol. The following IBM modems are supported by the 3820 Page Printer.

Modem	Speed (bps)	Lines
3833 model 1	2400	Nonswitched voice grade
3834 model 1	4800	Nonswitched voice grade
3863 model 1/2	2400/1200	Nonsw or Sw voice grade
3864 model 1/2	4800/2400	Nonsw or Sw voice grade
3865 model 1/2	9600/4800	Nonswitched voice grade
3868 model 1	2400/1200	Nonswitched voice grade
3868 model 2	4800/2400	Nonswitched

3820 Page Printer

3868 model 3/4	9600/4800	voice grade Nonswitched
3872 model 1	2400/1200	voice grade Nonsw or Sw

MVS System/370 Channel Attachment Through VTAM: The following IBM Processors are supported by System/370 Channel attachment through VTAM:

- 308X and 3090 Processors
- 4341 Processor
- 4361 Processor Model Group 5
- 4381 Processors
- IBM Processors operating in System/370 Extended Architecture mode
- 9375 Model 60
- 9377 Model 90

VSE System/370 Channel Attachment Through VTAM: The following IBM Processors are supported by System/370 Channel attachment through VTAM:

- 308X Processors (Guest under VM)
- 4331 All models
- 4341 All models
- 4361 All models
- 4381 Models 1, 2, 11, 12, and 13 (System/370 mode only)
- 4381 Models 3 and 14 (Guest under VM)
- 9373 Model 20
- 9375 Model 40
- 9375 Model 60
- 9377 Model 90

VM System/370 Channel Attachment Through VTAM: The following IBM Processors are supported by System/370 Channel attachment through VTAM:

- 308X and 3090 Processors
- 4331 All models
- 4341 All models
- 4361 All models
- 4381 All models
- 9373 Model 20
- 9375 Model 40

- 9375 Model 60
- 9377 Model 90

(Canada only) IBM Personal Computer Local Area Network IBM Personal Computers Supported:

- IBM PC Network: IBM Personal Computer, IBM Personal Computer XT, and IBM Personal Computer AT.
- Corvus OMNINET: IBM Personal Computer and IBM Personal Computer XT.

See the "Programming Section of the Sales Manual" for additional details.

3044 Fiber Optics Attachment: The following IBM Processors are supported by 3044 Fiber Optics attachment (Block multiplexer channel):

- 4361
- 4381
- 308X
- 3090.

Additional Hardware

- SDLC communications adapter card and communications cable for attaching PC.
- EIA Interface Cable for modem attachment.
- Self-clocking external modem or modem eliminator, which supports EIA RS-232-C interface and protocol supporting point-to-point, non-switched, common carrier service.<)

Customer's Responsibilities: It is the customer's responsibility to allocate the appropriate space and electrical requirements to properly accommodate the 3820 Page Printer. See "IBM 3820 Page Printer Introduction and Planning Guide", G544-3520, for additional details.

It is the customer's responsibility to insure the availability of the necessary supply items for the operation of the 3820 Page Printer, and to replenish/replace supplies as needed, with the exception of the developer mix. Customer supplied developer mix must be installed/replaced by a service representative when replacement is needed.

It is the customer's responsibility to provide the appropriate attachment facilities including modems, communication facilities, attachment cables.

Publications: The following publications are available from Mechanicsburg:

- "IBM 3820 Page Printer Introduction and Planning Guide", G544-3520
- "IBM 3820 Page Printer Reference Manual", S544-3175
- "Advanced Function Printing Software: General Information", G544-3415
- "IBM's Guide for Type Users", G544-3122
- "IBM-Supplied Fonts for System-Attached Printers", G544-3328
- "IBM's Guide for Using MVS Print Management Facility with Type Printing", G544-3123
- (Canada only) "IBM LAN PrintManager", G544-3184<)

The "3820 Page Printer Operator's Guide", S544-3080, and the "3820 Page Printer Operator Summary", S544-3081, are shipped with the printer. Additional copies are available from Mechanicsburg.

SPECIFY

This section lists items which will be furnished when specified on an initial machines order. Unless otherwise noted, these specify

features are only available at the time of manufacture. The number to the right of the item is the Feature Code.

- Color: Pebble Grey. No Specify.
- Voltage Group: The Voltage Group requirement is determined by the three-digit country code (120V or 200-240V). (Except Japan > No Specify required. <) (Japan only > Specify #2995 for 100V. No Specify required for 200-240V. <)
- Frequency Group: The three-digit country code determines the Voltage Group.

50Hz 10Amps (200-240V) #9005
60Hz 20Amps (120V) #9010
60Hz 10Amps (200-240V) #9010

Memory: Control Storage-768KB. No Specify.

Country Group: The Country Group requirement is determined by the three-digit country code. The Country Group contains the safety labels for the 3820 Page Printer. No Specify.

Language Groups: The Language Group specifies the language for the Control Panel Overlay, all labels other than safety labels, and the Operator's Guide.

English #9050
French #9025
German #9030
Italian #9035
Japanese #9055
Spanish #9040

Font Selection: One "Resident" font (Prestige Elite) is in the printer. No Specify.

Power Cables: Power cables requirements, (with the exception of Chicago and Japan), are determined by the three-digit country code and are "No Specify" items. (Japan only > Japan 100V cable determined by Specify in Voltage Group. <)

(Canada only >

10 ft. Twistlock, 20A cable-Standard

(6 ft. Twistlock, 20A cable provided for 3820s ordered (for Chicago only)) #9986

Connector Plug: NEMA L5-20P-Standard <)

Except in Canada and the countries listed below, a line cord of 3m will be attached to the machine. The appropriate plug will be attached by the customer engineer at the time of installation.

Australia

4m cable
Plug configuration conforms to Australian standard AS C112-1964

New Zealand

4m cable
Plug configuration conforms to New Zealand standard NZ 198

Japan

3.8m cable
Plug configuration conforms to Japanese standard JIS C8303

SPECIAL FEATURES

Attachments

EIA Interface #3050
S/370 Channel Interface #3055

Either the EIA or the S/370 Channel Interface Attachment must be specified.

Feature Conversions: To convert from an EIA attachment feature to a Channel attachment feature order RPQ FG0013. To convert from a Channel attachment feature to an EIA attachment feature order RPQ FG0014.

Memory Sizes

Pattern Storage: (Must Specify a Minimum of One)

1024KB (1 1024KB Card) #3020 (See note)
2048KB (2 1024KB Cards) #3025
3072KB (3 1024KB Cards) #3030
4096KB (4 1-24KB Cards) #3065

Note: Field changes to Pattern Storage may be made by ordering increments of 512KB or 1024KB only, up to a maximum Pattern Storage of 4096KB. Marketing Representatives need to be aware that there are four available card slots for Pattern Storage memory cards. Therefore, storage requirements should be anticipated with the original order to preclude the possibility of scrapping purchased memory cards.

Machines using double byte fonts (Kanji, etc) must have minimum of 1024KB Pattern Storage.

Miscellaneous

Relocation/Discontinuance Kit: In the event the 3820 is relocated or discontinued, MES B/M 7380762 should be ordered. The order will be filled by Charlotte, NC. The machine should be shipped via truck.

MODEL CONVERSIONS (NONE)

ACCESSORIES

The following items are available from IBM on a purchase-only basis.

EIA Interface: An EIA Interface Cable specified below, or equivalent, is required if an EIA Interface Attachment Feature (#3050) is installed. For shipment with the machine, order the feature number below.

EIA Interface Cable-Long (12m) #3040
EIA Interface Cable-Short (6m) #3045

For shipment by MES, order the P/N below.

EIA Interface Cable-Long (12m) 1670923
EIA Interface Cable-Short (6m) 1670924

S/370 Channel: A System/370 Channel interface Cable specified below, or equivalent, is required if a System/370 Channel Interface Attachment Feature (#3055) is installed.

Channel Interface Cable Group #3920
Power Sequence and Control CableUGroup #1178

SUPPLIES

Choosing the right supplies is very important for customer satisfaction with the 3820 Page Printer. For the best print quality and the most reliable performance, the use of IBM supplies is recommended. Supplies are purchase only items.

The 3820 Page Printer is shipped with a minimum quantity of supplies (2 200 gram bottles of IBM 3820 Toner, 1 bottle of IBM 3820 Developer Mix, and 1 bottle of IBM 3820 Fuser Oil). One IBM 3820 Paper Cassette, an accessory, is also shipped with the printer. The customer is responsible for ordering and keeping on hand adequate supplies to maintain operation of the 3820 Page Printer.

MACHINES

Consult your country supplies organization.

Description	P/N
IBM 3820 Toner 6 200 gram (7.1 ounce) Bottles per Carton	1669113
IBM Developer Mix 1 550 gram (19.4 ounce) Bottle per Carton	1669151
IBM 3820 Fuser Oil 1 900 cc (1.9 pint) Bottle per Carton	1669115
*IBM 3820 Paper Cassette	1678261
*IBM 3820 B5 Paper Cassette	1348140
IBM Multi-System Paper-Letter 8 reams of 500 sheets per ream (Available in U.S. Only)	7034548
IBM Multi-System Paper-Legal 8 reams of 500 sheets per ream (Available in U.S. only)	7034550

* These items are considered accessories by IBM, but are ordered as described above.

Note: It is the responsibility of the customer to purchase supply items required for the operation of the 3820 Page Printer. The customer also is responsible for installation/replacement of supplies in the printer, with the exception of the developer mix. A service representative will install customer supplied developer mix when replacement is necessary. Replacement of the developer mix, a supply item, by a service representative, is available only for the 3820 Page Printer. This exception to the generally accepted practice of customer installation of supplies is made because the replacement of the developer mix requires use of tools and a technical knowledge of the developer mix, by an IBM Service Representative, is included in the 3820 Page Printer Warranty and Maintenance Agreement. For machines not under Maintenance Agreement, replacement of the developer mix is on a per call basis.

See "IBM 3820 Page Printer Introduction and Planning Guide", G544-3520, for details on estimated yields.

SUPPORTING LICENSED PROGRAMS

Typographic Fonts

- Sonoran Serif - (5771-ABA) is a typefont which is the functional equivalent of Monotype Times New Roman**. This program product provides 14 sizes, 2 weights, and 2 styles (Roman and Italic) of this type face.
- Sonoran Sans Serif - (5771-ABB) is a typefont which provides the functional equivalent of Monotype Ariel**. This program

product provides 14 sizes, 2 weights and 2 styles (Roman and Italic) of this type face.

- Pi and Specials - (5771-ABC) contains special purpose symbols, Sonoran Petite (a 4-point font which is the functional equivalent of Monotype Elfin**) and Sonoran Display (a functional equivalent of Monotype Old English**).
- Data - (5771-ADA) contains four 13.3-pitch fonts. These fonts are uniformly spaced and are provided in Roman, Italic, Roman Bold, and Extended Character Set variations. They contain the full complement of characters required by most text and data processing print applications.
- APL2 - (5771-ADB) contains thirteen fonts to support the extended APL2 character set. These fonts are uniformly spaced and consist of 10-, 12-, 13.3-, 15-, and 20-pitch variations.

** Trademarks of The Monotype Corporation, Limited.

IBM Double Byte Character Fonts

- Kanji Source Fonts for the 3820 Page Printer, (5771-ADE).
- Kanji Object Fonts for the 3820 Page Printer/MVS, (5771-ADF).
- Kanji Object Fonts for the 3820 Page Printer/VSE, (5771-ADG).

Licensed Programs: The 3820 Page Printer is supported by the Advanced Function Software Licensed Programs shown below:

- Print Services Facility/MVS, Release 1.1, (5665-275).
- Print Services Facility/VM, Release 1.0, (5664-198).
- Print Services Facility/VSE, Release 1.2, (5666-319).
- Print Management Facility/MVS, Release 1.1, (5665-307).
- Print Management Facility/VM, Release 1.0, (5664-310).
- Overlay Generation Language/MVS, Release 1.0 plus PTF, (5665-308).
- Overlay Generation Language/VM, Release 1.0, (5664-293).
- Overlay Generation Language/VSE, Release 1.0, (5666-324).
- Print Services Access Facility/MVS, Release 1.1, (5665-340).
- Print Services Access Facility/VM, Release 1.0, (5664-312).
- Page Printer Formatting Aid/VM, Release 1.0, (5664-199).
- Page Printer Formatting Aid/VSE, Release 1.0, (5666-327).
- Page Printer Formatting Aid/MVS, Release 1.0, (5665-351).
- Document Composition Facility, Release 3.0 plus PTF, (5748-XX9).
- Graphical Data Display Manager/VM, Version 2.1, (5664-200).
- Graphical Data Display Manager/MVS, Version 2.1, (5665-356).
- Graphical Data Display Manager/VSE, Version 2.1, (5666-328).
- Font Library Service Facility, Release 1.0, (5668-890).
- (Canada only) 3820 Page Printer Local Area Network PrintManager, (5875-XXX Feature Code #9396). <

3830 STORAGE CONTROL MDL 1, 2

PURPOSE

Control unit for 3330, 3333, 3340, 3344 or 3350 disk storage.

MODELS

Model 1 001 [NO LONGER AVAILABLE] Provides for attachment of up to four 3330 modules in any combination of models 1 and/or 2. Attaches to S/360 model 195 or S/370 models 165, 168 or 195 via a 2880 Block Multiplexer Channel. Attachment to the S/370 models 135 or 145 is made via the system block multiplexer channel or selector channel and to the 135-3, 138, 145-3 and 148 via the block multiplexer channel. Attachment to S/370 models 155 or 158 is made via the system's block multiplexer channel. Attachment to a 3031, 3032 or 3033 Processor is made via a block multiplexer channel. Attaches to the 4341 or 4381 Processor via a block multiplexer channel.

Model 2 001 [NO LONGER AVAILABLE] Provides for attachment 3333s (models 1 and/or 11) and/or 3340 model A2s and/or 3350 model A2s/A2Fs ... see DASD Configuration under "Specify". Additional storage is provided by attaching 3330 modules to the 3333 or by attaching 3340 model Bs and/or 3344s to the 3340 model A2 or by attaching 3350 model Bs and/or a model C to the 3350 model A2/A2F ... see DASD Configuration under "Specify" and M3330, 3333, 3340, 3344, 3350 pages.

Attaches to S/360 model 195 or S/370 models 165, 168 or 195 via a 2880 Block Multiplexer Channel. Attachment to S/370 model 135 (see "Limitations") or 145 is made via the system's block multiplexer channel or selector channel and to the 135-3, 138, 145-3 and 148 via the block multiplexer channel. Attachment to S/370 model 155 or 158 is made via the system's block multiplexer channel. Attachment to a 3031, 3032, 3033, 3081, 3083 or 3084 Processor is made via a block multiplexer channel. Attaches to the 4341 or 4381 Processor via a block multiplexer channel and to the 4331 (Model Group 2) or 4361 Processor via the High-Speed Block Multiplexer Channel. Note: The 3830 model 2 does not attach to a 3090 Processor.

Prerequisites: [1] The 3830 mdl 1 is designed for interconnected operation with 3330 Disk Storages. Customers who wish to order a 3830 mdl 1 for stand-alone or individual use should submit an RPQ to provide the necessary safety elements (covers, cable connectors, etc.) to complete the unit for a non-standard (i.e., not interconnected as part of a 3330 facility) environment. In lieu of the RPQ, the customer may provide safety elements equivalent to the standard 3830 mdl 1/3330 configuration or that provided by the RPQ. If not provided, the unit will be offered on a purchase-only basis. See "Specify". Agreement for IBM to install and maintain the 3830 mdl 1 in any non-standard environment must be reviewed with CE Regional Management prior to making a commitment to the customer.

[2] An available control unit position on a channel. One unshared subchannel for each drive attached on a system block multiplexer channel or a 2880 Block Multiplexer Channel. For S/360 (3330 series only) mdl 195 and S/370 mdl 165, 168, 195, see M2880 pages. For S/370, mdls 135 and 145, and 4300 processors, a system block multiplexer channel is required for support of block multiplexing and rotational position sensing ... see M3333, 3330, 3340, 3344 and 3350 pages. If this support is not required, attachment to a system selector channel is permitted.

Limitations: [1] Only one Two-Channel Switch (#8170) and one Two-Channel Switch, Add'l (#8171) can be installed on a 3830.

HIGHLIGHTS

Data rate is 806,000 bytes per second for the 3333 and 3330, and 885,000 bytes per second for the 3340 and 3344 and 1,198,000 bytes per second for the 3350. File organization and format are under program control ... command structure permits flexible and efficient processing of either randomly or sequentially organized files. Data

integrity is provided through extensive error detection and correction capabilities.

Standard Features: ... include the following:

Rotational Position Sensing (optional on a 3340): Makes possible a "seek" to an explicit position on a track. The 3830 and the channel are released during most of record search time, thereby increasing channel and storage facility availability.

Multiple Requesting (on 3340, concurrent with optional Rotational Position Sensing): The 3830 mdl 1 allows up to eight, and the 3830 mdl 2 allows up to 32 channel command sequences to be active in the facility. Permits better utilization of control unit, devices, channel, and CPU.

Command Chaining: Allows sequential records within a cylinder to be read/written by a sequence of channel commands without rotational delays between records.

Record Overflow: Storage efficiency is obtained by allowing records to span track boundaries within a cylinder.

Bibliography: GC20-0001

SPECIFY

- Power (AC, 3-phase, 4-wire): [must be consistent with 3330 or 3333 voltage]

50 Hz 200V #2807 220V #2815 235V #2818 380V #2816 408V #2819	60 Hz 200V #2733 208V #9903 230V #9905

German #2929
- DASD Configuration (3830 mdl 2): The available combinations of storage devices which can be attached are shown in the tables below. One, two or three Xs in a vertical column indicate the type of machine(s) listed under DASD Configuration which can be attached when the "Required DASD Specify Features" are installed. Based on the DASD, and the Special Features listed below being ordered for them, order the Required DASD Specify Feature(s) from the appropriate table.

3830 Storage Control Mdl 1, 2 (cont'd)
3830 MDL 2 WITH OR WITHOUT TWO-CHANNEL SWITCH (#8170)

DASD Configuration		Required DASD Specify Features (2)						
		(1) 9313	(1) 9314	(1,3) 9315	(1,3) 9316	(1,4) 9317	(1,5) 9318	
3333 Only	One or two 3333s with associated 3330s	x	x					
	Up to four 3333s with associated 3330s			x	x			
	String Switch (#8150) on any 3333	x		x				
3340 Only	One or two 3340 mdl A2s with associated mdl B1/B2s		x	x				
	Up to four 3340 mdl A2s with associated mdl B1/B2s				x	x		
	String Switch (#8150) on any 3340 mdl A2		x		x	x		
	Fixed Head feature (#4301/#4302) on any 3340			x		x	x	
3340 3344	Up to four 3340 mdl A2s of which up to two may attach 3344s						x	x
	String Switch (#8150) on any 3340 mdl A2 and/or Fixed Head feature (#4301/#4302) on any 3340						x	
	3333s and 3340 mdl A2s (any combination of 2, 3, or 4) each with associated drives				x	x		
3333 3340 -not 3344	String Switch (#8150) on any 3333 or 3340 mdl A2				x		x	
	Fixed Head feature (#4301/#4302) on any 3340					x	x	
3350 Only	Up to four 3350 mdl A2/A2Fs with associated mdl B2/B2Fs, C2/C2F							x
	String Switch (#8150) on any 3350 mdl A2/A2F, C2/C2F						x	
3333 3340 3350 -not 3344	3333s, 3340 mdl A2s and 3350 mdl A2/A2Fs (any combination of 2, 3, or 4) with associated drives							x
	String Switch (#8150) on any 3333, 3340 mdl A2, or 3350 mdl A2/A2F, C2/C2F and/or Fixed Head feature (#4301/#4302) on any 3340							x

Notes:

- ISC diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchased machines to include any number of diskette-only changes ordered on the same diskette.
- Any change to an installed DASD configuration requires an MES ONLY if the new configuration indicates that a different Specify and/or Special Feature(s) is required. The MES must include addition of any new Specify and/or Special Features not previously installed AND removal of any not listed as required for the new configuration.
- Control Store Extension (#2150) is prerequisite. With #9315, the 3830 mdl 2 requires 32 contiguous device addresses regardless of the number of drives attached.
- Control Store Extension (#2150) and Register Expansion (#6111) are prerequisites. For configurations in this group the 3830 mdl 2 uses 64 contiguous device addresses irrespective of the number of drives attached. The 3340 mdl A2s on the first and third strings may attach up to three 3340 mdl B1s, B2s, and/or 3344s in any combination. The 3340 mdl A2 on the second string may attach up to three 3340 mdl B1/B2s. The 3340 mdl A2 on the fourth string may attach one 3340 mdl B1 or B2.
- Expanded Control Store (#2151), Control Store Extension (#2150) and Register Expansion (#6111) are prerequisites. For configurations in this group the 3830 mdl 2 uses 8 or 16 or 32 or 64 device addresses depending upon the DASD configuration installed and whether any 3350 drive is in 3330-1 compatibility mode.

3830 MDL 2 WITH TWO-CHANNEL SWITCH, ADD'L (#8171) AND ITS PREREQUISITE TWO-CHANNEL SWITCH (#8170)

DASD Configuration		Required DASD Specify Features (2)

3333 3340 3350 -not 3344	String Switch (#8150) on any 3333, 3340 mdl A2, or 3350 mdl A2/A2F, C2/C2F and/or Fixed Head feature (#4301/#4302) on any 3340					x

Notes: For explanations, see Notes following the Table "3830 Mdl 2 With or Without Two-Channel Switch (#8170)".

SPECIAL FEATURES

Control Store Extension (#2150): [Mdl 2] Provides additional control store for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts above to determine which is required. **Field Installation:** Yes. **Maximum:** One.

Expanded Control Store (#2151): [Mdl 2] Provides additional control store for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** #2150. A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts to determine which is required. **Note:** Customer price quotations and customer order acknowledgement letters must state: "Installation of this feature involves removal of parts which become the property of IBM." **Maximum:** One. **Field Installation:** Yes.

Register Expansion (#6111): [Mdl 2] Provides additional registers for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts to determine which is required. **Field Installation:** Yes. **Maximum:** One.

Remote Switch Attachment (#6148): [Mdl 2] To attach the Two-Channel Switch (#8170) to a configuration control panel. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): [Mdl 2] To attach the Two-Channel Switch, Add'l (#8171) to a configuration control panel. **Field Installation:** Yes.

Two-Channel Switch (#8170): To attach the 3830 to a second channel ... the two channels may be on the same processor or different processors. An available control unit position is required on each channel ... see item [2] under "Prerequisites". Switching is under program control. The 3830 can be dedicated to a single channel by means of an Enable/Disable switch. **Specify:** #9721 only if #8170 is being ordered for field installation and will be installed at the same time as Two-Channel Switch, Add'l (#8171). **Field Installation:** Yes. **Maximum:** One.

3830 Storage Control Mdl 1, 2 (cont'd)

Two-Channel Switch, Add'l (#8171): Adds switching for two additional channels to a 3830 with Two-Channel Switch (#8170), providing four channel switch capability. **Limitations:** Only two channels of the four available can be attached to the same processor. Cannot be installed if Fixed Head feature (#4301/#4302) is installed on any 3340. **Specify:** #9722 only if #8171 is being ordered for field installation and will be installed at the same time as Two-Channel Switch (#8170). **Field Installation:** Yes. **Maximum:** One. **Prerequisites:** #8170, #2151 and/or #2150 are also required in certain 3830 mdl 2 configurations ... see DASD Configuration under "Specify".

MODEL CONVERSIONS

Model 1 to model 2 is field installable. Model 2 to model 1 is not recommended for field installation.

ACCESSORIES (None)

SUPPLIES (None)

MACHINES

3830 STORAGE CONTROL MDL 3
PURPOSE

Provides for the attachment of 3333/3330/3350 DASD in a 3850 Mass Storage System.

MODELS

Model 3 003

Prerequisites: The 3830 mdl 3 must have the Two-Channel Switch (#8170) and Control Store Extension (#2150). One channel interface attaches to the 3851 MSF and one channel interface attaches to the host processor.

Limitations

- [1] A maximum of four 3830 mdl 3s may be attached to a S/370, 4341 or 4381 Processor block multiplexer channel. If 3830 mdl 1s or 2s and/or Integrated Storage Controls (#4650) are attached to the same block multiplexer channel, the maximum number of 3830 mdl 3s will be reduced. Consult *IBM 3850 Mass Storage (MSS) Installation Planning, and Table Create*, GC35-0028, for total system limitations.
- [2] String Switch (#8150) may be installed on the 3333/3350 in a 3850 MSS for additional availability. Installation is not recommended in a mixed MSS/Non-MSS environment. See M3333, 3350 pages for additional limitations.
- [3] 3340 DASD cannot be installed on the 3830 mdl 3.

HIGHLIGHTS

Virtual Disk Storage: Provides up to 64 unique addresses for each channel interface.

Channel Interfaces: Up to three processor channel interfaces are available, providing up to 192 unique addresses on each 3830 mdl 3.

Drives: Up to 32 DASD spindles of 3333/3330 mdls 1, 2 and 11 and 3350 mdls A2/A2F, B2/B2F and C2/C2F can be attached. A 3830 mdl 3 with #9320 can operate any combination of up to four 3333 mdls 1 and 11 with associated 3330 mdls 1, 2 and 11 and/or native 3350 mdls A2/A2F with associated native 3350 mdls B2/B2F and C2/C2F. A 3830 mdl 3 with #6250 can operate up to four 3350 mdls A2/A2F with associated 3350 mdls B2/B2F and C2/C2F in either native or 3330 mdl 11 mode. See M3333, 3330 and 3350 pages for additional information.

Staging Drives: Up to sixteen 3333 mdl 1/3330 mdl 1 or 2 storage devices can be designated as staging drives. 3333/3330 mdl 11 or 3350 in 3330 mdl 11 mode may also be used for staging drives; however, each mdl 11 or 3350 in mdl 11 mode drive designated as a staging drive is equivalent to two mdl 1 or mdl 2 drives. These staging drives will be used by the 3850 Mass Storage System to provide virtual storage. See note on M3333 pages for feature changes required when 3333s are retained for use with a 3851.

Staging Paths: The 3830 mdl 3 contains control store for data buffering and microcode. This accomplishes data staging without using S/370, 4341 or 4381 Processor channels or memory.

Real Drives: Up to a maximum of 32 attached drives may be designated as "real". Each Real drive uses one of the 192 unique 3830 addresses. All 3350 drives attached to a 3830 mdl 3 with #9320 must be designated as Real in 3350 native mode only. 3350 drives attached to a 3830 mdl 3 with #6250 may be designated as Real in 3350 native or 3330 mdl 11 mode.

Virtual Storage: All data stored in the 3850 Mass Storage System appears to the system as residing on a 3333/3330 storage device with all the data handling capabilities of the 3330 available.

Limitations: 3333/3330 Mdls 1, 2, 11 are not supported as staging drives on a 3090 Processor.

Bibliography: GC20-0001

- Language Groups:

English #2927	Italian #2932
French #2928	Japanese #2930
German #2929	Spanish #2931

SPECIAL FEATURES

Control Store Extension (#2150): [req'd] Provides additional control store for microprogram use. **Field Installation:** Yes.

Expanded Control Store (#2151): Provides additional control store for microprogram use. Required if 3350 DASD is attached. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2150.

Control Store, Add'l (#2152): Provides additional control store for microprogram use. Required if 3350 DASD is attached. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2150, #6111 and #2151.

Register Expansion (#6111): Provides additional registers for microprogram use. Required if 3350 DASD is attached. **Field Installation:** Yes. **Maximum:** One.

Remote Switch Attachment (#6148): To attach the Two-Channel Switch (#8170) to a configuration panel. **Maximum:** One. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): To attach the Two-Channel Switch, Add'l (#8171) to a configuration panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6148.

3350 Staging (#6250): Provides for staging to 3350 drives in 3330 mdl 11 mode and access to Real 3350 in either native or 3330 mdl 11 mode. **Limitations:** Attachment of 3333 mdls 1/11, 3330 mdls 1, 2 or 11 is mutually exclusive with #6250. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2152 and #6111.

Two-Channel Switch (#8170): [req'd] Provides system channel attachment capability for the 3830 mdl 3. One channel interface attaches to the 3851 MSF and one channel interface attaches to the host processor. An available control unit position is required. See "Prerequisites" and "Limitations". **Field Installation:** Yes.

Two-Channel Switch, Add'l (#8171): Provides attachment for two additional channels to a 3830 mdl 3, providing three processor channel switch capability. **Limitations:** Only two of the three channel interfaces can be attached to channels on the same processor. **Maximum:** One ... see "Prerequisites" and "Limitations". **Field Installation:** Yes. **Prerequisites:** #8170.

MODEL CONVERSIONS

Model 2 can be field changed to a model 3. MES order for model change must include correct serial number and all installed and on-order features and RPOs on the 3830 model 2 to be changed. It must also include removal of any of the following which are installed: #9190, #9314, #9315, #9317, #9318, #9841. Prior to ordering the model change, installed and on-order RPOs should be resubmitted to IBM. Control Store Extension (#2150) and Two-Channel Switch (#8170) must be previously installed or installed concurrently with the model upgrade. For customers who wish to have an installed 3830 model 1 converted directly to a 3830 model 3, submit an RPO. The 3830 mdl 3 to mdl 2 conversion is not recommended for field installation.

ACCESSORIES (None)
SUPPLIES (None)

‡ ISC diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchased machines to include any number of diskette-only changes ordered on the same diskette.

3833 MODEM

PURPOSE

A 2400-bit modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). This advanced microprocessor-based modem significantly enhances communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing:

- Probable cause of network errors
- Alert messages on error threshold
- Formatted modem test results

MODELS

Model 001: Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point multipoint control, or multipoint tributary mode.

Customer Setup (CSU): The 3833 is designated for customer setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. A modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches. Note: Some changes of the setup switches may require SYSGEN changes in the program support. (Except Canada > In countries where Customer Setup is prohibited or impractical, terms and conditions will include CE support for installation. IBM to determine if Customer Setup applies. <)

HIGHLIGHTS

- Volume purchase price reductions are available for quantity purchases.
- The Warranty Option for IBM On-site Exchange service during warranty instead of Customer On-site Exchange service is ordered by specifying #9876 with the machine order.

Standard Features

- Data Rate: 2400 bits with backup of 1200 bits.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (2400/1200 bits) of the local modem.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). This is a Customer selectable switch option.
- Automatic and Adaptive Equalization: P Equalization is automatically performed by the modem and continues to adapt while in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operates with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modem accepts commands and initiates tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provides the network operator with the most probable cause of network problems.

- Modem provides its own clocking or will accept DTE (external) clocking.

Built-in diagnostics: All modems (for modems on tail links, see "Tail Circuit Attachment" in the Accessories section) will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and quality and level of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by 303X, 308X, 4300, S/36 and 8100 processors for data transmission. Thus, diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA, implemented under the Network Communication Control Facility (NCCF) program product, has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results. The following program products at the stated level or subsequent levels, unless specified otherwise, may be used:

1. Network Problem Determination Application (NPDA) Version 3 Release 2.

Note: NPDA Version 3 Release 1 may be used but will not display the proper modem type number on Remote Self Test screen.

2. Network Communication Control Facility (NCCF) Release 2.
3. ACF/NCP Version 3. The S/36 System Support Program (5727-SS1) includes an online problem determination facility that uses the 3833 and 3834 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the S/36 operator console. These tests help the system operator locate the failing component (S/36, local modem, line, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the modem operator panel. These manual tests include:

- Modem self-test -- This includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance.
- Lamp test -- tests all indicator lights on the operator panel.

Extended Diagnostics: This 3833 standard function enhances the diagnostic capabilities of modems. It must be installed in both the local and remote modem (not standard with 3863 modem). It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. This function may not function properly in some countries on a multipoint line of normal quality.

Maintenance Service: It is a customer responsibility to determine when maintenance is required by using the Customer Problem Analysis and Resolution Guide provided with the machine. It is a

customer responsibility to call a designated telephone number for service according to one of the Maintenance Agreement options:

IBM On-Site Repair (IOR)
IBM On-Site Exchange (IOE) #9830
Customer On-Site Exchange (COE) #9824
Customer Carry-in Exchange (CCE) #9816
Customer Carry-in Repair (CCR) #9821

Warranty: The warranty period for the 3833 modem is one year. Warranty Service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amendment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) (Except Canada > or IBM On-Site Repair in countries where Exchange/Repair Services are not available.) A warranty option provides, for an additional charge, the IBM On-Site Exchange (IOE) during the same period instead of the Customer On-Site Exchange. Order #9876 with machine order. The 3833 modem will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The service offering after warranty will be one of the Maintenance Agreement options described above.

On-Site CPAR Assistance: If a customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR) the customer calls the Marketing Representative who will arrange for CE/CSR on-site assistance. IBM will assist the customer on site in performing CPAR procedures using the same documentation that is available to the customer. On-site assistance is provided on a time and material basis.

Communication Facilities

PTT Facilities: Telecommunications lines of a normal quality for data transmission can be used. See IBM for the availability of such facilities in your country.

Privately owned Communication Facilities: Equivalent to above.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

(Canada only > Transmission of data between the United States and Canada is supported. The channel in Canada must be schedule 4, type 4.<.)
